Fountains and Chick Feeders

THE NORWICH AUTOMATIC FEEDER COMPANY
7 Trumbull St., New London, Conn.

Pedigreed White Wyandottes and White Leghorns

Our birds are trap-nested the year around. They are bred to lay and lay well; 10 and 12 weeks old stock for sale. No more baby chicks this year.

DR. B. H. MANSEL,

Box 202,

QUAKERTOWN, PA.

gather the impression that the spirit of some present-day members of the American Poultry Association who are active in the councils of the latter, has undergone a material change from that of the founders of the old organization.

Editor Frank L. Platt is a member of the Committee of Forty and has attended the meetings of the latter; consequently is in a position to express his opinions regarding the functions of, and the work done by, that Committee, more or less authoritatively, albeit personally.

He defines his position in a manner that is of far-reaching importance and clearly establishes the fact of the issue being a sharply defined one between the fancier on the one hand, and the utility man on the other.

A general revision of the Standard, according to the by-laws of the A. P. A., shall take place once in eight years. This law makes 1923 the year when a new revised edition shall be published.

The Committee of Forty has accepted an outline for a chapter on production, authorized its preparation and will recommend its inclusion in the Standard at the next meeting, so Editor Platt states. This puts it up to the Standard Committee to either modify the Standard text and descriptions or permit the utility chapter to stand in direct opposition to the Standard type, a paradoxical situation to say the least.

"Length and shape of feather," is only one point of the sixty that are to be discussed in the chapter, and many breeds are affected by this one question of size of feather. It will be in order to start this discussion early and crystallize it down to compact form before handing it over to the Standard Committee, which has so much real important work to dispose of. It should be spared of being a party to a discussion which can only result in widening the gap between the fancier and the utility breeder. All breeds of fowl have feathers. Typical breed shape is governed largely by the length and breadth of the individual feather, while the color markings of the plumage of the different varieties are also influenced by the size of the feathers.

The standard of today is the law for the breeder and judge, a book of rules established by the authority of the American Poultry Association. Pigmentation and molting are and should be foreign to its text. As Editor Platt remarks: "The molt cannot be Standardized." Pigmentation depends largely for its stability or loss on the strain of fowl and soil and feed. Heavy laying will pale the shanks and beak in hens to a greater or lesser degree, so no arbitrary or safe rule can be laid down for appraising such by a scale of points. To allow such fading of shank and beak color, would take away from them a most important breed characteristic. This would be followed by changing the scaled points, which practically means that the points for color and beak in the yellow shanked Mediterranean and American varieties would be passed by. It is bad enough today to find birds winning in the show-room with very pale shanks, it even goes so far, as to include cocks and cockerels in some instances. The fading of shanks and beaks in male feathered bipeds certainly cannot be laid to "production" or "ovarian changes!"

The true breeder of such yellow-shanked varieties has spent his time and given his ability to perfecting the latter in every section possible. The shank and beak sections are or should be, of importance as well as all other sections. Perfection as a whole can only exist with a perfection in all the parts. It is for breeders to decide whether or not yellow shanks and beaks are important breed properties.

Thirty years ago that master breeder of Light Brahmas made the following prophetic remark: "It is just as essential to have a Standard as ever. I trust we may have a more instructive and better defined one than we now have, beautifully illustrated, one that will educate breeders up to all that is within nature's limits based on sound breeding principles and not one based to a great extent on speculation." The black faced type is ours.

The American Standard of Perfection of today may not be all that George Purdue trusted it would be, but it will come closely approximately to his ideal of what a Standard should be. To a very appreciable degree it is based on sound breeding principles of experienced breeders, and to a degree on speculation.

To the fancier, the true and progressive breeder of Standard fowl, the man or woman who really loves and admires beauty in type and color, and has and will improve and safeguard the utilitarian qualities of the breed or variety he or she may be interested in, the American Standard of Perfection is a 100 percent proposition.

WHITE ORPINGTONS ASCENDING LADDER OF POPULARITY.

The White Orpingtons are again going forward, not with a disastrous boom movement, but a result bringing irresistible push that cannot be denied.

You beginners, and those who have been hesitating on the choice of a breed, get started now with this sterling variety, and reap the rewards of the increasing popularity which cannot longer be withheld.

At the district and state meets held the past season, large classes and competition have been the rule without exception.

Beginning with Augusta, Ga., where 117 birds of this variety were cooped, and going on down the line, the following large classes were shown:

Providence, R. I.....	101
Portland, Maine	80
Milwaukee, Wis.	69
Edmonton, Canada	84
Houston, Texas	199

and lastly, the grand class at Madison Square Garden consisted of 152 White Orpingtons.

Nearly one thousand high class specimens at these various shows covering all parts of the country. Truly magnificent and a showing well worthy the breed and efforts put forth by the officers and members of the American White Orpington Club.

A noticeable feature of the past show season was the almost entire absence of brassy males. Notwithstanding the unusually large classes, the

writer saw only one brassy male and this was shown by a new exhibitor. It is my prediction that brassiness will be entirely eliminated within the next few years, and thus remove the last drawback to the increased popularity the White Orpington, so richly deserves.

For winter eggs, when eggs are worth most, for a choice market fowl, none better, and lastly, for a lordly exhibition bird the White Orpington is the par excellence of all.

Now a word to beginners and others.

In starting with hatching eggs do not expect 15 prize winners from a single setting of eggs, no matter what price you pay for them. If such results were possible, the price of eggs would be in proportion. When you purchase eggs for hatching, both you and the seller are gambling on the contents of the basket. You may raise the one best chicken of the year, or you may raise not one worth keeping, and this is where the gamble comes in. No one knows in advance what any certain egg will produce, and this is why hatching eggs are sold at such low prices and also explains why so many customers are disappointed.

White Orpingtons have been known to lay at between four and five months of age, this is invariably at the expense of size which is one of the main desirable features of this bird. I believe a good, sound, safe rule to follow is to allow a month for each pound to mature weight and as Standard for pullets calls for 7 pounds, it

is my belief that they should not be brought to laying maturity much sooner than seven months. This gives plenty of time to fully mature the bird's frame, and fill it out with the necessary flesh to withstand the heavy drain of egg production in the out of season months.

When our young birds arrive at the fall stage, let us look around and see what we have to pay for all our time and trouble. There is a cockerel that looks good, let us band him and see that he has some extra care and feed. Also we seem to see a rather nice looking pullet. Let us do the same with her. After we get to this stage, do not get cold feet, but keep after these and any other promising chicks, so that when show time rolls around, we shall have them fit and ready. When you have raised some good ones, do not fail to show them.

Perhaps you may not win a "blue" at your first try, or perhaps may not even land a ribbon at all, but keep at it until you do get there. Remember this if you fail the first time, all of the successful breeders of today were from ten to fifteen years building up their strain, so do not get discouraged but keep everlastingly at it, and you will eventually be rewarded with success. In the meantime, join the American White Orpington Club and help boost your breed. You need the club and the club needs your influence and dues.

Now then, all together, let's make the good year 1921 and the years to follow, a drive for more and better White Orpingtons. C. D. Snow.

CANDEE

Candee Double Automatic Temperature Control Means Big Hatches of Healthy Chicks

EGGs cannot overheat. It is the only incubator with the patented double automatic temperature control that compels constant correct heat no matter what the size of the incubator or how many compartments are in use. And the automatic regulator at the heater controls the drafts and keeps the water in the supply mains at the proper temperature continually.

In each 300-egg compartment, of which there are two to each section, there is an automatic temperature regulator that controls the flow of hot water from the supply mains into that compartment, admitting more or less hot water to keep the temperature in that compartment absolutely correct at all times during the entire hatching period. And the Candee Incubator is properly ventilated without chilling drafts.

The great service performed by the double temperature regulation is that, the eggs simply cannot overheat in the Candee Incubator and when eggs never become overheated but receive the proper warmth constantly, you can be sure of the best possible hatches. This double automatic regulation consists of a principle of incubation that is not to be found in any other incubator. It is the fundamentally right principle and is not an experiment—it was built into the first Candee Incubator and has never been changed.

The Candee Sections Come All-Built Ready to Use—No Expert Needed to Install

The Candee is truly sectional. Each section contains two 300-egg compartments with four 75-egg trays in each compartment. Each section is complete in itself with all partitions, radiators, piping, automatic regulators, etc. No expert needed to set up. Just place the sections on the legs and connect the main water supply pipe to sections. The Candee sections easily pass through an ordinary door opening.

Start Hatches at Different Times

Because each compartment is complete in itself with its own automatic temperature regulator, hatches can be started or stopped at any time in any compartment without interfering in any way with the operation of the other compartments.

Write for Big Free Catalog—Get the Facts

There are many other reasons why the Candee gives the best results. They're all explained and illustrated in the big Free Candee Catalog—a book that is more than an incubator catalog—a guide and textbook to most productive poultry raising. Write for your free copy today.

Stop Hatching Weak Chicks**With Cheap Incubators**

Remember, it is not how many you hatch that counts, but how many you raise. A Queen costs but little more, and the extra chicks that live and grow soon pay the difference.

Queen Incubators

Hatch Chicks That Live and Grow

Accurately regulated—taking care of a variation of 70 degrees without danger. Built of genuine Redwood—very scarce in these days of imitation. Cheaper woods, and pasteboard lining in iron and tin machines, retain the odors to weaken and kill the hatching chicks.

Start your chicks with a Queen constitution and they will make money for you. Catalog free.

Queen Incubator Co. Lincoln, Nebr.

Raise Silver Foxes

Easy to raise. Larger profits than any other live stock raising. **Standards strictest investigation. Recommended by Government. 4 different plans. One will suit you. Complete description free. Send today.**

C. T. DRYZ, Box 1032, EAGLE RIVER, WIS.

Could you tell me if gladioli bulbs multiply, or do the bulbs die after blooming? Also tuberose bulbs? I am going to set out one Delicious apple tree, 4 to 5 feet, this spring, and also one Yellow Transparent apple tree and a Sapa plum tree. How long will it be before they bear fruit, providing they live? I also intend to set out some Cumberland and St. Regis berry bushes and 125 Progressive and Superb strawberry plants.

Iowa. U. M. T.

The gladiolus bulb does not die after blooming, but can and should be re-planted each spring. Each bulb throws out numerous little bulblets. Save these and plant. They will bloom in two or three years. In fall dig all bulbs and store in a dry room where it does not freeze. Tuberose can be kept dormant by placing in the cellar in the fall, and can be set out each spring.

Your Delicious trees will, or ought to, give you fruit the sixth year. The Yellow Transparent should produce fruit in four years.

* * *

We have a native white Juneberry growing here which a friend of mine discovered last year. Several bushes are growing on his farm and bore freely of the white berries last season. This is quite a novelty. Would these have any commercial value if propagated? How would you suggest to propagate them, from seed or otherwise?

Have also seen native white chokecherries. These were more of a transparent color like the white currants. I have some localities spotted and intend, if I can, to get some young trees and set them out for shrubbery.

The hardy raspberries do well in the Turtle mountains, and also strawberries. The wild berries are native and some years plentiful. What varieties of raspberries would you recommend for commercial planting here, and also the variety of strawberries? All kinds of small fruits have a very good local demand and command good prices.

The white Juneberries were a chalk, or milk white, with a red seed. S. W. Wilson.

North Dakota.

I cannot tell you the value of this Juneberry without an inspection of the fruit. I am of the opinion that such a hardy bush, if it bears usable fruit of fair quality, should be propagated and that it would find a ready sale. The best way to propagate this Juneberry would be to plant the seeds and then root-graft, using scions from the bushes bearing the best fruit. The seedlings would throw all kinds of fruit—good, poor and worthless. Would like to see some of this fruit.

The chokecherry will make a very nice ornamental tree for home planting.

Advise you to get in touch with Prof. Hansen of the South Dakota Experiment Station, at Brookings, S. D. He has brought out several very hardy raspberries and can give you the desired information.

Plant Dunlap, Haveland, Gibson and Sample strawberries.

You will find the Red Cross and Diploma currant and Oregon Champion gooseberry very profitable. These fruits net me about \$600 each year.

* * *

I have an opportunity to purchase a small fruit ranch in Okanogan county, north central Washington. There is an irrigation project there and, I imagine, fruit growing is the foremost occupation. Would you consider fruit growing profitable there? Also, what are the advantages of poultry raising for fancy or egg trade? Can you give me the altitude at this point, and about how long are

the winters there? Would the climate there be agreeable to a northerner. Is the Okanogan river navigable at Okanogan the year around, and how swift is the current?

North Dakota.

James A. Thorsen.

Fruit growing in the locality you mention is very profitable. The climate and conditions are very favorable to profitable poultry raising. The altitude of the location referred to is 2,833 feet, as given by Cram. The winters are comparatively short, not over three months' duration. Yes, the climate would be to your liking. The Okanogan river is not navigable to the larger boats at Okanogan. I cannot tell you the current gauge of the river.

* * *

I have been told that black walnut trees planted near other trees or fruit trees will interfere with the growth of the others and cause some diseases. Is this so?

Also, to whom does one send his money and application to take out a membership in the American Poultry Association?

I take three poultry journals and none gives the address or any information about a beginner joining the A. P. A. If these papers gave any information, or even if there was an extra leaf in the back of the Standard of Perfection, I think the membership would increase faster, as I and three others here would have joined before, and there are probably many more the country over.

Kansas.

J. H. Gibbs.

Black walnut trees are subject to rust and diseases which are serious to fruit trees. I would not want apple and other fruit trees planted near black walnut trees, although I have seen such a condition, which seemed to be without harm to the fruit trees.

If you will write Mrs. E. B. Campbell, secretary of the American Poultry Association, 655 West Third street, Fort Wayne, Ind., she will send you application blanks and all desired information regarding membership in the association.

* * *

I am writing you for a little advice on a location to which to move. Now, I am a person who has only a little money and I do not want to lose it. I noticed in your journal you speak of several places that would make a good home, Leesburg, Va., being one. We plan on going there this fall and shall try to buy from 25 to 40 acres of their fair or good land there. Now, do you think we can make a living on it with some fruit and poultry, if we work and carefully plan. We have one child.

Another idea we have is to go to Baltimore, Md., and the men work and the women raise chickens on the outskirts of the city, there being two sisters who have four children. Which would be best for us?

It is so cold here that we must feed stock so long that I do not wish to remain here. Can a man get work there?

Wisconsin.

Mrs. A. R. Larson.

It does seem to me that you folks would do very well financially either in the vicinity of Baltimore or on a general and poultry farm near Leesburg. It simply is impossible for me to tell you as to the measure of success you would meet in any given place. That rests entirely with yourselves. The propositions you outline are wholly feasible and ought to give you good financial returns. Your friend doesn't know what he is talking about when he belittles the people of Virginia.

* * *

I am a young married man with \$5,000 cash, and I want your advice on buying a 10-acre farm just outside Springfield, Greene county, Missouri. I have had six years' ex-

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.
J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right.
OSCAR THOMPSON,
Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.
JOHN HOLTRAP,
Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective.
HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter.
FRED S. WILLIS,
Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers.
EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried.
MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.
J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed.
MRS. L. M. JOHNSON,
Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.
BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.
L. G. STAYNOS,
Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

Chicken Mites Filled With the Life Blood of Faithful Bees.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

MONEY BACK IF IT FAILS.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

THE END.

AMERICAN SUPPLY CO. Dept. 54 QUINCY, ILLINOIS

**Read what this man
has to say about the
Feed that brings
results** 

Clinton, Ind., May 3, 1921.
A word as to the quality of your feeds. Have fed your steel cut oats, rolled oats and chick mash and chick grains to my Mottled Anconas with the following results: At 4 weeks and 5 days old the average weight was 8 oz., with the biggest one weighing 12 oz., and that is not all, at the same age I caught two little cockerels crowing. Can you beat it? Now, at nearly 7 weeks of age they average 12 oz. in weight, the cockerels are crowing lustily and are beginning to annoy the pullets. Your feeds bring results and are simply above comparison.
JOHN FILCHAK.

Buy pure, wholesome and sound feeds such as we mill for you and then watch the youngsters develop into profit producing specimens that will make money for you. But, remember, you must have guaranteed feeds.

Pinhead or Steel Cut and Rolled Oats

Let us send you one or both of these wholesome feeds to give to your growing chicks. There is no better food found anywhere than these two for chicks.

Send Your Formula Write and tell us what you are feeding and we will quote you prices that are governed by the quotations in the grain market, and when the prices go down you get the benefit. Could anything be fairer? Let us quote you on hulled or pinhead oats. We want you to know more about basic feeds as ground and sold by us. Let us send you our current price list; you can see what ground poultry meal is worth at mill prices.

BASIC FEEDS COMPANY, Box 325, LOCKPORT, ILL.

perience in general farming. I want to raise poultry, fruit and truck. I have had considerable experience with my favorite White Leghorns, and want to keep a cow and a few hogs. I want to leave northern Illinois on account of my wife's weak lungs. Do you think the mild southwestern Missouri climate will help my wife?
A. P. McGrew.

Illinois.
Write the state horticultural college authorities at Springfield, Mo., for information. The climate there ought to be more favorable for your wife than in northern Illinois.

* * *
I would like your advice in regard to the care of the following fruit trees: cherry, peach, apple, pear, and also grapes. I especially desire to know what to spray each with, and when they should be sprayed each year.
J. C. Crannell.

Illinois.
Spray all these trees and vines with Scalecide when dormant, fall and spring. Spray with arsenate of lead to which is added Black Leaf. Spray just as the blossoms are falling. For the plums use Sulfocide when blossoms are falling. This should be repeated in about ten days. Spray the plum trees also with arsenate of lead, but wait till Sulfocide has been on trees a few days.

For fungous diseases use Sulfocide or Pyrox.

* * *
We are living near the east coast of Massachusetts and the extreme dampness and fluctuations of climate do not agree with our health. Have heard that the vicinity of San Diego, Calif., was quite even, also mild, but would like to know the disagreeable points of this locality before making so tremendous a change. Is there much dampness there? Are there tarantulas, centipedes, scorpions, fleas or snakes in southern California? Can two persons get a living from poultry and small fruits on one acre of land in that section of the country? Have had two years' experience with fifty hens, which have paid.

Would there be difficulties with Mexicans or Japs for people living in such a small country place in southern California?
Massachusetts.
F. P. Harris.

One acre of ground devoted to poultry and small fruit will not afford a living for two people. That is out of all reason, regardless of the claims made by enthusiastic poultry and fruit boomers. None of the disagreeable things you refer to exist in any degree anywhere in southern California.

* * *
Have just bought five acres of hill land one mile from Klamath Falls. The elevation here is 4100 feet and the temperature very seldom goes down to 10 degrees below zero in winter, but some years late spring frost cuts the fruit crop short.

A good deal of the level land is irrigated and alfalfa does well. Here on hill land we do not have irrigation, and the summers are quite dry. This is a rather new part of the country, and very little outside of stock raising has been tried. The soil contains a good deal of volcanic ashes and is easily worked.

Want to make a home here and intend to keep poultry, but also wish to raise enough fruit for home use. Will want some apples, cherries and peaches. Intend to raise some berries for market, as they are in great demand—such as, currants, raspberries, gooseberries, and also a few loganberries and grapes. Will experiment a little with strawberries.

This land has good air drainage and I think it will do wonders if handled right, so I am coming to you for advice.

What kinds of fruits and berries do you think would do best up here in the mountains? How many should I plant, and when should I plant? Tell me what you would do if you were in my place. Will greatly appreciate any other suggestions and advice.

Oregon.
Sigurd Seim.

You will find the Duchess and Henry Clay valuable early apples. For fall, plant the Wealthy; for winter varieties choose Delicious, Golden Delicious, Senator, Winter Banana and Bellflower.

The Fay and Red Cross currant and

WHITE DIARRHEA

A PERFECT HATCH! THEN WHAT?

Will you save every chick, or shall WHITE DIARRHEA get them? This contagious germ disease causes greater loss than all other poultry diseases combined. In infected flock the loss varies from 50 to 80 per cent of the chicks hatched. Chicks that recover often remain stunted all their lives. Stop this enormous loss. Raise every chick you hatch. No need to lose a single one. Raise them all. Keep them healthy and strong and growing fast.

"Siles" POULTRY-TONE

is a safe and effective germicide for all bowel germ diseases. It combats the germs that cause white diarrhea and it tones up the system so the chicks can resist disease.

"Siles" POULTRY-TONE positively prevents White Diarrhea. For Chicks already affected, it affords prompt and permanent relief.

RAT-SNAP KILLS RATS

"WE SAVED CHICKS, EGGS AND FEED"

Writes Mrs. J. Mason of Virginia. "I paid \$1.25 for five cakes of RAT-SNAP and by the large number of dead rats which we picked up, I reckon we saved hundreds of dollars in chicks, eggs and feed."

RAT-SNAP kills them, dries up the carcasses and leaves no smell; cats and dogs won't touch it. Comes in convenient size cakes; no mixing with other food.

Get a package today. 3 sizes—35c for kitchen or cellar; 65c for chicken houses or corn cribs; \$1.25 for barns and outbuildings.

Your money back if RAT-SNAP doesn't do the work. For sale by drug and hardware stores.

92% Pure Carbonate of Lime. More eggs, harder shells, healthier hens, cost 1c per pound. Ask your dealer, look for trademark, write for booklet. W. A. REUBEN & CO., St. Louis, Mo.

Oregon Champion gooseberry will give you best results. I cannot name the number of trees and vines you should plant. You must make your plantings according to conditions of which I can know very little. The currants and gooseberries you will find very profitable. You certainly will find the combination farm—poultry and fruit—a pleasant and profitable one.

* * *

I have purchased ten acres of land half a mile outside the city limits. This land needs tile, which I shall put in this summer. While I read every one of your articles in the Journal, and I have a plan made out from your articles, still, I am not sure but that you might suggest a better one, as you often correct suggestions proposed by your correspondents.

Ohio.

I will be very glad to give you what help I can in developing this land—if you will be kind enough to tell me what you desire to do with it.

* * *

I live in the city and have some very fine Norway maple shade trees, set out twenty-five years ago. Under these trees are lots of seedlings. Would it be possible to transplant these to my garden lot and raise them to sell, and, if so, could you give me some idea how to do it?

New York.

Yes, it would be a good plan to remove these maple trees as you suggest, by so doing. These young trees should be transplanted early in the fall. Plant them in rows about three feet apart, with the trees about two feet apart in the rows. Cultivate trees during the spring and summer. There is always a demand for such trees at good prices.

* * *

I am thinking of setting out some young fruit trees this spring and would like for you to pass judgment on my selections. I am new to this and would highly appreciate any suggestions. I just want the fruit for the use of a family of two, but later would like to try fruit farming on a larger scale. These are the varieties I have selected and the number of each:

Apples—1 Henry Clay, 1 Early Harvest, 1 Liveland Raspberry, 1 Maidenblush, 1 Wilson Red June, 2 Double Life Grimes Golden, 2 Stark Delicious, 2 Golden Delicious, 3 Northern Spies, 1 Stark Gold crabapple.

Pears—2 Stark Seckel, 1 Kieffer. Plums—1 Wild Goose Improved, 1 Damsen. Peaches—2 Early Elberta, 2 Heath Summer Cling, 2 October Elberta, 8 Altons. Cherries—1 Dyehouse, 1 Suda Hardy, 1 Montmorency.

Raspberries—25 Cuthbert, 25 Columbian, 50 Cumberland. Blackberries—50 Eldorado, 50 Early Harvest.

Strawberries—200 Senator Dunlap, 200 Dr. Burrill, 200 Uncle Jim.

Grapes—3 King (Giant Concord), 2 Stark Delicious, 2 Stark Eclipse, 2 Niagara.

As raspberries are tip-bearing, we thought we would only buy a few and set out the new plants that grew up from time to time.

At the old home when I was a child we had a red apple tree that ripened apples about the same time as the Early Harvest. It was colored to a dark red, flesh firm but deliciously sweet, having a different taste from most early apples. I wonder if you could tell me what it was from my meager description. I surely would like to have a tree of it.

Have about 100 White Leghorn hens and want to keep at least 350 next year. We are just making our start, consequently everything comes slow and seems somewhat expensive, so thought it best to start small and grow.

Illinois.

Your list is a very good one and I can suggest but few changes therein. Would plant also one Florence crab tree.

Your list of plums is very incomplete. Plant also Omaha, Surprise and Terry. Do not fail to do this. Would cut out Uncle Jim strawberry and make the list Burrill, Haveland, Gibson and Sample. Would include the Moore's Early and

Worden and Concord grapes, by all means. I think the apple to which you refer was the old and valued Sayer. I do not know where it can be secured now.

* * *

I have twenty acres of land in Taylor county, Florida, about two miles from the town of Thelma. Am thinking of moving onto the land this fall and would appreciate it if you could give me a few suggestions. I have Single Comb Black Minorcas and White Rock chickens. Could they be moved from here without change of climate hurting them? Also, what kinds of vegetables would you advise planting for a quick crop? This land is improved and there is some timber on the place. Do you think a man with about \$2,000 could go onto the land, build a small house and get things going in good shape?

South Dakota. M. F. Derrick.

You will find that \$2,000 is a very limited capital with which to clear this land, improve it, and plant to fruit and a vegetable patch. You may be able to do it and win out. Your poultry can be cheaply housed and will give you immediate financial returns. Each section down there specializes on certain vegetables. In the location you refer to, cabbage, lettuce, egg plants and beans are largely grown.

Summer Green Food.

Dwarf Essex rape can be planted any time during the summer in the northern states. In July and August mix one-third oat seed with the rape, as the oats will come up first and serve as shade for the rape. Do not sow too thickly. It will quickly make the poultry run green, and when either hens or growing birds are turned into the rape they will eat it with great relish. However, there is danger of them killing it out, and if it can be grown in a separate place and the leaves cut and fed to the poultry, it will prove an ideal green feed.

Rape grows quickly and grows very rank if not cut back. It is the cheapest green food for summer and early fall. Anyone having a summer egg trade in fancy eggs cannot find a better egg producer, and it also gives a richness to the egg. The leaf is very tender and succulent and is greatly relished and easily digested. It is an ideal green-stuff for the range in which young chickens are growing.

TOWN LOT POULTRY RAISING.

By E. H. HOFFMAN.

Did you ever stop to think of the enormous amount of poultry that is being raised in the cities and villages, and what satisfaction there is in raising a few chickens on a town lot? Many of the blue ribbon winners at the largest poultry shows in the country are hatched and raised on town lots that provide only a limited amount of room. It is a mistaken idea that poultry must be raised on a large farm in order for the young stock to mature rapidly, and develop into birds that are satisfactory, either for quality or for exhibition purposes. I dare say that 50 percent, and perhaps more, of the high class poultry exhibited in the country is raised in limited quarters.

This does not mean that too many birds can be successfully reared in a small space, but it does mean that without overcrowding and with proper feed and care, the highest quality of stock can be produced in yards on back lots in the cities.

We often hear people say that they would like to have a few fowls but they have no room, believing that they must have an acre or two for range. When asked how much room they have they invariably say that they have a backyard "but chickens need a large amount of space to run on."

For sake of comparison let us see what conditions exist on a free range and how nearly we can provide substitutes for the birds that are raised on a town lot. Green feed, bugs and worms and activity are the essentials for thrifty chickens, and these must be provided, either in one form or another, whether the chickens are on a farm or in limited quarters. On free range it will be noted that the birds stray away from the house in search of tender blades of grass, grit, insects and worms,

all of which go to provide material for making eggs. The spring of the year, when the sprouts begin to crop through the ground and the grubs and other insects make their appearance, is the ideal time for ranging, and it is only natural that the heaviest egg production of the year comes during that period.

The birds are so eager for these essentials that when enjoying the liberty of a range, they keep busy scratching and hunting from early morning until dusk, and still they are never overfed. It is remarkable how fowls will work all day on free range, picking up morsels of various kinds and not overeat; but it is nature that takes care of that, also the variety of food plays an important part. We know that these are the conditions of fowls in their natural state, and therefore the same conditions, as near as possible, should be provided when they are confined in yarded quarters.

The back-lot poultryman should first decide what breed is best suited to his town-lot enterprise. After that has been done, he should then build houses and yards sufficiently large to accommodate about the number of birds that he intends to keep.

One of the worst things that can be done on a limited space of ground is to keep too many birds together, either during feeding time or at night on the roosts. Probably more chicks are lost during their growing period by overcrowding than from any other one cause. It is a good rule to keep only twenty-five chicks or fowls together in one house and one run.

Where fifty birds are kept on a town-lot it is far better to have them divided into two colonies of twenty-five each than to keep the entire number in one house. The birds will do much better, grow more rapidly and the old fowls will lay more eggs if this plan is used.

Many of the so-called substitutes may

WHITE ROCK COCK HEADING FIRST OLD PEN

be easily provided. For instance laying mash can be purchased and this food contains many of the ingredients that the fowls crave. The commercial egg mash is scientifically prepared and is well balanced to satisfy the appetites of the birds. It contains a certain amount of each of the feeds required to make eggs and at the same time keep the body in a healthy condition.

Sharp grit can be purchased in sizes suitable for either chicks or hens and this is probably better for grinding than the pebbles that are picked up on free range.

One of the most important feeds required by fowls in confinement is green food, and it is surprising how few flocks are giving a proper amount of green feed or roughage. Sprouted oats are considered the best of all green succulents and can very easily be provided. An oat sprouter can be purchased at a reasonable price, or oats can be sprouted in pens. This can be done during the winter months by keeping the pans near the stove and sprinkling them daily with a little warm water. It is surprising what a difference it will make in the egg supply if the hens are fed sprouted oats every day or even every other day. Those who are not feeding green feed are not getting the results that they should get in the matter of eggs.

In the spring of the year when the chicks are growing it is a simple plan to build frames about three or four inches above the ground and inside of them plant oats, covering the frame with a small wire mesh. As the oats sprout and reach the top of the wire the chicks can pick off the tops and still the roots will be unharmed and the green stuff will continue to grow.

There are many other green feeds than can be supplied during the summer months. Tender lawn clippings make an excellent feed, and lettuce and tender weeds in the spring months are greatly relished by the chicks.

Meat scraps and buttermilk or skimmed milk are substitutes for worms and bugs. With all these conditions provided as far as the feeding is concerned, the birds in small quarters will thrive as well as on free range. But there is something else that is just as important as the feeding and that is cleanliness and ventilation.

A constant fight must be made against lice from the time the chicks are hatched until they reach maturity. Greasing the heads of the little chicks during the first month if hatched with hens, and dusting the mother hens with insect powder at least once a week are very important.

Raising poultry on a back lot requires attention the same as anything else with which one desires to be successful. Even when the weather is hot in mid-summer the real fancier does not hesitate to clean the poultry houses, disinfect the roosts, spade the runs and provide the proper feed and fresh water that they require. The real fancier rather enjoys this sort of pastime and never objects to doing the little things that must be done on a small back lot poultry plant. If he does not like the work he had far better never have gone into the business because he will surely fail.

There are many people residing in the cities and villages who are fond of fresh eggs and nice fowls for table use. If they would construct a small place in one corner of their back yard, start with a few Standardbred fowls of what-

A guide to success in this, the most difficult poultry problem

Know How to Turn Loss Into Profit

The results of many years of practical experience and study. Written by Prince T. Woods, a man who knows how and who can teach others. This book will save many dollars for any poultryman and is indispensable to the beginner.

ever breed or variety they like best, take an interest in feeding them and keeping them comfortable, they would soon learn that it is a profitable investment and at the same time provide a recreation for spare time that would be alike pleasant and refreshing.

Business men, doctors, lawyers, clerks and working men all over the country are engaged in this useful pastime of back-lot poultry keeping, and they enjoy the work. Nearly every family has enough scraps from the table to furnish feed for a few chickens and the additional grain and other things required for comparatively larger numbers can be purchased at reasonable prices.

Birds of the highest quality can be raised on the back lot and develop just as rapidly as if allowed to range on a farm, provided the conditions can be provided as near as possible to those enjoyed by the birds when allowed free range.

Off-Colored Feathers.

The secretary of the White Orpington Club writes me: "It is an exception rather than the rule to find a bird that has absolutely no off-colored feathers." I agree with him. In fact, I would go further and state that I doubt if a white bird has ever been bred that has not at some time or other had an off-colored feather. Notice I said white bird. Some people have an idea that the White Orpington is the only white fowl that produces off-colored feathers, which is far from the case. I have had experience with other breeds and found that the same thing exists. I have in mind one very popular breed of white fowls that is very much worse than the White Orpingtons in this respect, and the white birds are by no means alone in this respect.

What about colored and parti-colored birds? Did any of you ever notice the black feathers scattered underneath the coops in the Barred Rock alley in the showroom? If not, notice it the next show you attend. Now, where do these black feathers come from? Simple; they are the off-colored feathers that had been overlooked when the birds were being prepared for the show.

If your birds have a few off-colored feathers in them, do as the breeders of other varieties do: pluck them out before showing them. Sometimes the feather has a little color on one side only. In that case all you need to do is strip the colored side off. It is rather singular, but nevertheless true, that a White Orpington with a little black in the plumage is a better color than one without, and a little black in a good breeding male by no means disqualifies him as a breeder. Of course the few off-colored feathers a white bird has, the better.

If you have a bird with buff or cream color running across the wing bow, give him the axe, as they are useless as breeders. Select your birds with the least off-color for breeding, and you will gradually get a purer color. However, I am afraid these off-colored feathers will appear in spite of all we can do. Off-colored feathers appear in breeds that have been bred before any of the present generation were born, and will probably continue. So why worry.

When you buy a bird and after the molt he has a few off-colored feathers, do not think the breeder that sold him to you is a crook. These feathers may not have appeared in his first molt.

They say a black horse has never been bred without a white hair, and I doubt if a white chicken has even been hatched that has not had foreign color in it at some time.—Harold Rawnley.

The following table will serve as a guide in estimating the probable cost of maintaining a flock of poultry. It shows the approximate average amount of feed and litter for one hundred hens for one year.

Two tons scratch grain,
Two tons dry mash,
One ton mangel beets,
One ton straw and litter,
100 lbs. grit and shell.

The one hundred hens should yield one ton of eggs. This means 16,000 at an average weight of two ounces each.—Connecticut Agricultural College.

JAVA BREEDERS, ATTENTION!

By ROBIE WHITNEY.

I wish to make some statements in connection with the reference to the Jersey Black Giants in your February issue of American Poultry Journal, on page 198, in which the editor said: "If Black Orpington and Black Java men do not wake up, the Black Giants will come forward as the one popular American black fowl."

We Java breeders are obliged to admit your advice is true and good. We fully realize that the good old-fashioned Black Java will lose out entirely to the newcomers unless we "wake up," but, believe me, we are waking up. Not wholly because we have been asleep, but due to the oncoming of new breeds the Java has slipped back in quantity; but in quality we have some fine Javas in this country. The public will see them more strongly shown in the next few years. The breed has, I admit, been neglected in the past years, but, thanks to a few able men, the variety has been well bred during this time, though not greatly shown.

In reference to Jersey Black Giants, we will need to admit they are also a wonderful fowl, having fine flesh, large size, clear legs, are good layers and very attractive; but these qualities are also true of the Java. I understand, through talking with the person in charge of the Giants at the Boston show, that they are mostly Java blood, with some Langshan. Their large size is a combination of Java and Langshan, both being large sized birds when bred up to the Standard. The Java helps the quality of the flesh. The shape is very much Java, also the feet and legs; the feathers of the Langshans being done away with on the legs.

Yes, we Java breeders need to wake up; but all good breeders need to be awake. There is much for us to admit, but surely the Giant breeders need to admit that their birds are nearly all Java blood. No wonder they are good.

When the Giants become admitted to the Standard I am wondering what the Standard will be. They appear to be so much like the Java that it hardly seems fair to the old Java (which is really the back bone of some of the newer breeds) to have a new breed so much like them. It seems only fair that the new breed should have some distinctive points which would separate it sufficiently from both the Java and Langshan to safeguard the older breeds. For instance, at small shows or fairs a small Giant could be shown against a fair sized Java, or vice versa, and not be detected.

Now, I do not perhaps understand the Giants as well as I might, but I am always glad to receive pointers, so I will appreciate an article to follow this one, showing us what are the Standard points of a Giant. There should be some distinct breed character between the two before the Giant is recognized. As a distinct breed and admitted to the Standard, in order to guard against the two breeds conflicting, I would like to see a series of articles from different breeders of both breeds, for we all can learn quite a bit through a word now and then from the different breeders who show the right spirit. Good spirit and common sense are worth a great deal. Personally, I do not believe in running down the other fellow's breed, for there are mighty good points in all breeds, if the breeder likes them, understands them, giving them the right care. Breeders, come out and show signs of life.

From the article which I wrote for the March issue of American Poultry Journal I received the following letter from a friend of the Javas:

"In years past I have bred some thirty-odd varieties of Standard poultry, and the good old Black Java lingers in my memory as the very best of them all. Layers? Well, yes; they will begin laying from fifteen to thirty days sooner than the Reds, and lay as many eggs thereafter as any Red that ever lived. Hens will go to ten and eleven pounds, sometimes, and cocks twelve to thirteen pounds. Show me a chicken with as much breast meat and as large thighs, or a nicer yellow skin. Show me a chicken as hardy and as easy to rear. Show me a chicken which is as good all-round producer as the Black Java, and I will be under obligations to the man who does the showing.

"What about beauty? Set them up beside the Langshan, Black Orpington, Minorca, Black Leghorn, or any other black chicken, and see which wins out for beauty.

"Where did the Plymouth Rocks come from? Black Javas. Where did the Jersey Black Giants come from? Black Javas. And the Giants are no larger, to speak of, than the Javas; and I will bet \$30 against a brick

BARRED PLYMOUTH ROCKS are AMERICA'S GREATEST and GRANDEST BREED

The 100% American Breed, that for General Purpose lead the feathered tribe. PARKS Bred-to-Lay STRAIN is conceded to be the leaders of this wonderful breed, when it comes to EGGS and Fancy combined.

They've been carefully selected, trapnested and pedigreed for EGGS since 1889 and have made and hold about all the World's Barred Rocks Laying Records, as our literature and Official Records show.

Yes, Parks Rocks have simply layed their way into Universal Popularity the World Over.

**WHAT
YOU
CAN
BUY**

EGGS at half-price and prompt delivery.
CHICKS at reduced prices, none after June 22nd.
BREEDERS at one-third off list prices while surplus lasts.
YOUNGSTERS, March, April and May hatch, special prices July 1st to 15th.

From now until July 15th, will be bargain days for the shrewd buyers, and as a lot of breeders await our annual Reduced Price Sales Announcements, it will be well to get your orders placed early, as we anticipate a grand rush.

ANOTHER REMARKABLE RECORD.—Taft, Fla., May 10, 1921. Chickens hatched from our Pedigreed Pen Bred Eggs Jan. 13th. First pullet layed May 7th, when only 113 days old, next day three layed. They are wonderful fine looking birds too.—W. J. Jenson.

watch that the Javas lay two eggs to the Giants' one.

"Some years ago, Herbert Hodgson, of Illinois, had, I think, the finest flock of Javas in the United States. He had bred them for thirty years and could tell a few things about the Black Javas, as he also bred the Reds, Blue Andalusians, Leghorns, etc.

"You know there were three varieties of Javas, Black, White and Mottled. I never cared for the Mottled. I think that if the Rhode Island White roosters could find some White Javas and mix the breed with the Rhode Island Whites they could get rid of the objection that is often made, to-wit, that the S. C. Rhode Island White is too much like the White Plymouth Rock.

"G. M. Mathews, New York State, has some of the finest Black Javas in the country. Why do not you Black Java fellows keep at it? Have a short article in the leading papers. Keep everlastingly at it. Trapnest your hens. And in a few years you will put the good old-fashioned Black Javas where they belong—at the head of the list, where eggs and meat are wanted."

Green Yards for Hens.

The hens in the International Egg Contest at Storrs, Conn., were allowed to go out in the yards the week of April 24 for the first time this season. By avoiding early pasturing a very much better sod is maintained in the yards during the season, and extra green food is necessary only during the hot, dry weather in summer. The effect on egg production is a more even lay throughout the season rather than a very high early spring production followed by a drop. Many flocks of hens given free range during the early spring are confined in small yards without green food when the gardens are planted. This practice usually results in a short season of high production followed by a decline.

Broody Hens.

At this season of the year broody hens are always more or less troublesome in all of the heavy breeds and occasionally among the light breeds. All broody hens should be broken up promptly. If a broody hen is allowed to stay on the nest she loses body weight very rapidly, therefore it takes just that much longer to get her back into normal weight and production. Keep dry mash, green food and fresh water before broody hens while in confinement. It is worth while to put a celluloid band on each broody hen for each offense. This will furnish helpful information during the culling season.

Hens Need Mash and Animal Protein Now.

Mash and animal protein will make a marked increase in production and profit if fed in addition to the usual "grain only" ration. Egg production from March to September is 90 percent a feeding problem. Every dollar spent for mash and animal feed then will more than double itself in the value of extra eggs produced.

Less than 10 percent of farm hens gets proper feeding during the spring and summer months. They should have mash and animal protein all the year to make the best profit. That worms and bugs from the farm range meet this need is largely imaginary. Records show that farm hens "pick up" less than 25 percent of the feed needed for egg production. Grain and green feed are good, but alone do not supply enough protein to make egg albumen.

A mash may be made consisting of 50 pounds wheat bran, 50 pounds wheat middlings and 30 pounds of high grade tankage (60 percent protein). It is best fed in a self-feeder. One gallon of milk per day for each 30 hens in the flock will replace the tankage.

Feeding only grain in spring and summer causes most farm hens to stop laying and begin molting in May and June. Supplementing the grain with mash and animal protein will keep them laying. When it isn't profitable to buy bran, middlings and tankage (or use milk), it isn't profitable to keep hens. If you are not already feeding mash and animal protein, try it for a month and you will be surprised.—Purdue University.

Get Young Stock on Roosts.

Get the chicks to roost early, or if they are still going to bed on straw litter, make sure of three things: first, that it is dry; second, that it is reasonably clean; third, that there are no mites in the coop.

BROODING BABY CHICKS.

The most important subject of baby chicks is their parent stock. The chicks must come from healthy, vigorous parent stock. Sick or unhealthy breeding stock produces chicks deficient in stamina. These chicks are hard to raise and unsatisfactory even if they are reared.

When buying baby chicks it is very important to know something about the parent stock. The large breeders sell

chicks a little higher, but good chicks that are vigorous and healthy are the ones that are the cheapest in the end. When buying chicks from advertisers in American Poultry Journal you cannot go wrong, as the breeders must breed from their best and deliver the goods to hold their trade.

In brooding these carefully selected chicks I prefer coal or oil burning brooders. The brooder should be run a few days before placing the chicks under

it, so that the operator may have perfect control of the brooder and understand its working conditions.

When starting your brooder the temperature should be kept at about 103 degrees. This will allow the chicks to run around and away from the brooder without getting chilled, but care should be taken at first not to let the chicks go too far from the heat until they are accustomed and know where the heat is. In a short time they can be given more

room. I do not like to crowd baby chicks, as they will grow much quicker if allowed plenty of room. Watch the actions of the little chicks; the thermometer may read 105 degrees and yet the chicks may seem perfectly comfortable. I would rather go by the chicks than the thermometer.

Under my brooder I use an inch of sand with a little hay chaff on top. This protects the chicks' feet and induces them to exercise by forcing them to scratch for their food. The litter is very important to me, as it helps to keep them busy working all the time, which is the road to health.

The litter should be kept clean, sweet and dry. There is little use in trying to raise baby chicks successfully if their quarters are not kept clean. The feed and water dishes should be both kept clean and sweet. Use types of water dishes that prevent slopping of contents by the chicks on the litter, as this makes the litter damp and insanitary. The litter should be kept dry, as dampness is the prime cause of many chicken diseases.

Feeding baby chicks is next important to brooding. Supply them with fine grit or sand, chick size charcoal, and clean, fresh water until they are forty-eight hours old. I feed a commercial baby chick food when they are three days old, only what they can eat up in five minutes at one time, five times a day. After they are six to eight days old I give them all the chick feed they will clean up in ten minutes, four times a day, feeding a small amount of it in the litter. They soon learn to scratch and work for their grain, which makes them active and strong.

When they are twelve to fourteen days old I gradually start them on a good growing mash, which is kept before them until they are matured. They are then continued on fine grain three times a day, and a little green food is supplied every day.

The temperature under the brooder should be gradually reduced, starting at

EDWARD F. SCHMIDT

HAZELRIGG, IND.

103 degrees, reducing after the first week to 90 degrees, at the end of the second to 85 degrees, and so on until reduced to 70 degrees.

The important part in raising little baby chicks is in starting them right, keeping them growing, and developing in them good habits. With vigor and vitality in your breeding stock, and sufficient common sense, you are sure to succeed in growing chicks.—Ulric A. Thibault, Massachusetts.

GETTING A BETTER PRICE FOR MARKET EGGS.

With so many grocers and others buying eggs, regardless of quality, the farmer naturally asks, "What am I going to do about it?" That is largely a local problem, says W. C. Smith in Farm and Ranch. In some places the egg circles, so called, have brought about better marketing and a consequent gain in price to the producer. Similarly, in many localities two or three farmers are co-operating in grading and shipping their eggs to commission houses; others have been able to market to an advantage through the local packing companies, and in many instances the co-operative creamery companies are handling the eggs of the community on a strictly loss-off basis, demanding a fair quality and making it worth while to produce it.

Many people who have a case of fresh eggs once or twice a week during the late winter and early spring hesitate to ship them any distance to a commission man or firm, fearing that their business will not bulk large enough to gain any consideration. This is a mistake. Any reliable commission man, and there are many such, despite the panning they often receive, whom I have ever had dealings with will handle single case lots, but the quality must be high to bring the price. That is true whether you ship one case or a dozen. But bear in mind that you and you alone are responsible for the quality of your eggs when you market them direct and that some grading will be necessary. The flock will need looking after and the eggs will have to be handled right. Give your hens plenty of nests and keep them clean; gather eggs twice daily in warm weather and daily at other seasons; handle eggs just as little as possible; grade them to run to the same size—twenty-four to

twenty-six ounces to the dozen; cull out those widely above and below these weights; keep them in a cool place away from odors while being held; market only eggs of one color in the same case; feed your hens pure food and give them clean water; and aim at sanitation in everything connected with the hens and their product. That is not half as complicated at it sounds, and it pays. It also pays to interest your neighbor, for notwithstanding the fact that you can sell in small lots, you will have more weight if your shipments are larger and regular, and you have the advantage in the fact that you can take time to make a hunt for the best market.

Water as a Factor in Egg Production.

The value of water to the hen is shown by the many uses to which it is adapted.

(1) Water is used to soften the feed ready for digestion.

(2) Water is in the form of blood, acts as a common carrier, and carries the nourishing part of the food from the digestive organs to the tissues, and carries the worn-out, exhausted tissues to the different organs to be eliminated from the body.

(3) Water is important as a factor in egg production, as it enters into the composition of the egg as well as the hen's body, the egg being 70 percent water.

From the hen's viewpoint, water is worth as much as food, for she cannot make an egg with either one alone.

A hen will consume about six gallons of water to each one dollar's worth of feed; therefore, if the feed is worth one dollar to the hen, the water is also worth one dollar.

Drinking vessels should be carefully rinsed when fresh water is given. If water is supplied irregularly, the hens will likely drink too much at a time. It should not be exposed to the sun's rays in the summer or be allowed to freeze in winter. You will be surprised at the additional number of eggs if you will warm the drinking water and change it three or four times daily during the cold weather.—H. B. Lansden, Arkansas.

The Poultryman's Pest.

With the advent of warm weather chicken house mites breed rapidly. Apply whitewash to the walls and paint the roosts with liquid lice paint.

The hens will keep themselves reasonably free from body lice, by wallowing and dusting themselves in the dry earth. However, dusting with lice powder (by the pinch method) never does any harm and may be needed.

Growing chickens should be dusted, whether any lice are seen on them or not. Always make it a point to dust growing chickens once a month. Use lice powder and apply it by the pinch method, rubbing it into the feathers of the neck, back and breast and putting a little under each wing.

HATCHING EGGS AT HALF PRICE

You are certain to be satisfied with chicks hatched from our eggs. A few choice cockerels and hens for breeding left. Write for catalog.

EMORY H. BARTLETT, Box B, Enfield, Mass.

Kills Hatching

Many fanciers now use Egg-O-Latum, the great egg preserver, on all eggs for the market, not only to keep them fresh longer but to prevent use for hatching. Soft, white wax, odorless, tasteless, harmless. Rub on—wipe off—does not show. Eggs will never hatch but will keep fresh one year. 50c jar enough for 50 dozen, \$1.00 jar for 200 dozen. If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning.

GEO. H. LEE CO., Dept. P-2, OMAHA, NEBR.

KEEP CHICKS GROWING PROPERLY.

The enthusiasm with which many poultry raiser, particularly beginners, start in the spring with young chicks sometimes lags as the season advances and the chicks get old enough to shift for themselves. If care is neglected at this period, however, success is improbable. The baby chicks may be smart little fellows from strong, vigorous, parent stock, and they may have been brooded carefully for the first two or three weeks, but unless they receive proper care and management during their later growing period they will not develop properly, and many of them will be lost by sickness and disease.

Provide Suitable Food and Care.

The chief essentials to the proper growth of chicks are good coops, or houses, cleanliness, proper feed and water, shade, and free range. Growing chicks should be provided with large, roomy coops or houses, which will give them a comfortable place to stay at night and during stormy weather. The house should be so built that it will provide the chicks with plenty of light, pure air and sunshine, and protect them from dampness and storms of all kinds. It should be arranged so that it can be cleaned easily and frequently, which is very important.

Chicks should never be crowded in brood coops, for crowding will cause them to become overheated, resulting in improper growth and sometimes in dead chicks. A good house can be built from a dry goods box or a piano box, which can be covered with tar paper, the total cost being small.

Sickness or disease usually starts in unclean quarters, and in such places lice and mites are always more plentiful, the bulletin says. The coops should be cleaned and sprayed once a week, and clean shavings, chaff, or sand put on the floor. Examine the chicks and houses often for lice and mites, and if found they should be gotten rid of at once.

Feed Right for Rapid Growth.

The three kinds of feeds most necessary for rapid growth are grain feed, green feed, dry mash. A grain mixture should be fed night and morning, giving as large a quantity as the growing chickens will eat clean, but no more. A good mixture for growing chicks consists of three parts cracked corn, two parts wheat, and two parts hulled oats. Kafir corn or rolled or hulled barley may be substituted for hulled oats. A supply of fresh green feed is almost as necessary as grain for growing chicks. They obtain plenty of it if they have free range, but if kept in confinement, lawn grass, beet tops, cabbage, lettuce, or other such green feed should be supplied regularly.

A dry mash should be kept before growing chicks at all times after they are three or four weeks old. It is best to feed it in a hopper inside the building, or where it will not be exposed to rain or wet. The following mash may be made: Two pounds of corn meal, two pounds middlings, one pound oatmeal, two pounds bran, one pound beef scrap, and one-fourth pound of charcoal.

Grit and oyster shells should be provided so the chicks may help themselves whenever they wish. When sour milk can be obtained it should also be kept

YOU BE THE JUDGE GALLI-CURA

Prevents White Diarrhea and Fowl Cholera and will even save a large percentage of sick birds.

Use half a box of Galli-Cura and if not satisfied, return the remainder for your dollar.

SELL YOUR FARM, business; any property, located anywhere, by cooperative plan. Quick action. Less than half usual cost. Particulars free. E. F. McCormick, Oakland, Calif.

before the chicks, as no feed is regarded better for them. When this is given the amount of beef scrap in the dry mash may be reduced one-half. Plenty of fresh, clean water is absolutely necessary, and in hot weather it should be provided twice daily in dishes that have been thoroughly cleaned.

The importance of free range and shade for growing chicks should be emphasized. They are necessary if chicks are to grow rapidly and develop into vigorous fowls. When growing chicks have free range they obtain quantities of green feed, bugs, worms, and other things, therefore they require less grain

and are less liable to sickness and disease. U. S. Dept. of Agriculture.

A Good Word for Hamburgs.

I have four Silver Spangled Hamburg hens that laid five eggs on two different days. They are very pretty fowls and as you see from their record they are payers also. If you know of any flock that has done better I should like to hear of it.—J. Earle Pike, Vt.

When a Cockerel Becomes a Cock.

A bird to be shown as a cockerel in the poultry shows during the show season of September, 1920, to February, 1921, should have been hatched not earlier than January 1, 1920.

The fact is, however, that the bird is not really a cock until he molts in the fall, 1921.

Colors of Baby Chicks.

Beginners who invest in sittings of eggs or day-old chicks of some pure breed for the first time need not be alarmed if the young birds differ in color from their expectations. Especially is this the case with black plumaged fowls. The chicks of these are usually of an indeterminate gray, or else black and white.

As regards the legs, white-legged breeds are hatched with yellow shanks, whereas yellow-legged breeds should not show decidedly yellow legs at too early an age, although the foot should be yellow.

Crooked breast bones are frequently the result of chicks roosting on narrow roosts. Use 2x4's, broad side up, as roosts for growing birds of the heavy breeds.

A GRAND IMPROVEMENT

IN THE RELIABLE INCUBATOR & BROODER COMPANY'S BLUE FLAME HOVERS AND INCUBATORS WILL BE PUT ON THE MARKET AFTER JULY 1st.

Watch for these improvements. Do not buy elsewhere until you have examined them. Every possible trouble has been eliminated in our new outfit. Our aim is to lead the world in improvements. Every hover and incubator will be positively guaranteed.

C. C. SHOEMAKER, Box 605, FREEPORT, ILL.

TRACY'S POULTRY HOUSE.

A mere roosting shed and a modern hen house are two widely different buildings. A hen house is provided with dropping-boards. An old-fashioned roosting shed usually has no dropping-boards, for it is not intended that the hens should remain in the shed in the daytime; and the poultryman cleans it out once or twice a year. Such a shed usually allows no sunlight, except vent holes to provide fresh air. Hens pass the night in there, and at the first ray of light through the peepholes they are out, except in winter; and then you have a lot of birds cooped up to spend a miserable day in a dark shed—and they will not lay. Think of them in there, perched on their roost sticks, or down groping around in their own dirt!

A hen house should be built with one thought only—the comfort of the hen. A poultryman who builds a house without dropping-boards should keep pigs instead of chickens, for he has built a hog house. The comfort of the hen demands that the floor should be flooded with light. It should be, must be, as light upon the floor as out of doors. You see houses with great rows of windows up near the top. Ask the party why he put them there and he can only answer that it is to give light upon the roosts. Well, now, he must have a breed of hens that roost in the daytime. Anyway, on bad days he invites them to spend their time upon the roost by so arranging the windows that the roosts have more light than the floor.

I once put my windows up there and always found my hens up where the sun could shine on them. One cold day many years ago I looked into my coop to see them all huddled up on the perch where the sun shone most direct, and I said, "Aha! I see what's the matter. The sun shines in the daytime, and I have a breed of hens that roost at night, and here I am training them to roost both night and day. No wonder they do not lay!" I then began sawing out the boards below their roost and placed a window there, and in less time than you can read this article all those hens left their roosts and came down into the great rays of sunlight I had provided them right on the floor. Friends, let me tell you, I have since had a palace for my hens. Let me tell you how to build one.

A square house is impossible. A house 20x20 feet takes no thought of perches out of line of draughts, nor of light upon the floor. Let your house be 6x12 for twenty-five hens, 7x14 for forty hens, and 8x16 for fifty. That is all that ought ever be kept together.

It should be 7 feet high in front and 5 feet at the back. A 2x4 makes a wide enough sill and it should rest on cement foundation that is deep enough in the ground to keep rats out. It is well to put extra earth in to raise the floor. Cement should never be used. The floor should always be provided with deep straw litter. It should face the south. A door in the south side, 2 feet wide, two or three feet from the west end, should be made of cheesecloth and open outward. A 1-inch mesh wire door should hinge on the inside and open in. The nests should be at the door end, across the end, and about 18 inches above the floor. On top of these nests a self-feeding bran box may be made, using

the wall for the back, with sloping cover, up to which the hens can fly, with a 6-inch board in front.

To the east of the door, in the south side, should be another door that measures 30 inches high from the floor up, and nearly as long as the coop, hinged at the top, to open up and fasten above when you want it open. It should be made of cheesecloth. These are you curtains that you complain about being a trouble to take care of. If that be trouble, better do something else than raise fowls, for you are not fitted for the chicken industry. Inside this flat-wise window tack your 1-inch mesh wire.

In the north wall of the coop, a foot above the sill, make a flat-wise window 1 foot wide and 2 feet long, for ventilation in hot weather. Tack wire over the inside and fit a foot-wide board into the outside, which you can kick out easily.

Place the roosts crosswise of the coop at the east end of the coop. For dropping-boards use foot-wide boards with 1x4s nailed on the side like a trough. Let them be removable. You can carry them out for cleaning. For a roost pole use a 2x2, or 2x4, with corners rounded a bit.

In such a house the hens have the whole floor for a scratching pen. For city use it needs no yard whatever, winter or summer. Just keep it clean, and put in fresh litter once a month or so. It is built solely with a thought for the contentment and convenience of the hen. A glass window is fine to take the place of the long 30-inch high muslin covered opening just above the floor in the south side. Glass here, instead of muslin, will allow the sun to warm the coop better in winter and you can see your pretty birds. But if glass is used you must provide extra ventilation above, clear up at the top, over the hens. Therefore provide a muslin covered panel to be inserted one foot below the roof on the south side, in case the lower door is glass instead of muslin.

This coop makes a palace for a hen. Have nothing but cheap, unbleached muslin door and windows, no matter what climate you live in. Men live in houses all canvas.

These houses are incomparable. There are no gusts of wind up where the fowls roost. They spend no miserable days perched upon the roost pole, trying to get where the rays of the sun actually fall. They go down upon the floor itself for that.

Hens roost at night, and at the first streak of dawn they are down, in such a coop, in the light. Can you beat it?—J. A. Tracy, Colorado.

The Blue Andalusian is one of the oldest and most beautiful varieties of fowls in existence. It is ideal for farmer or fancier, for it possesses both exhibition and utility qualities.

Excelsior makes a dry nest for a setting hen, and eggs incubated in such a nest usually show a number of dead chicks in the shell.

How to Raise Chicks

128 pages, profusely illustrated. •An a to z manual for everyone who keeps fowls. Written by Prince T. Woods, a man who knows how and how to teach others. price 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

Sussex as General Purpose Fowls.

It may be well that in these days of cheaper eggs many people will turn their attention to general purpose fowls; that is to say, fowls that will not only lay a goodly quantity of large eggs but will produce a number of quick maturing cockerels of the best table quality. I am of opinion that if people are looking for such a breed they could not do better than adopt Sussex.

Recently there has been some controversy as to whether the Sussex is purely a table fowl or a general purpose fowl, says the National Poultry Journal. I have no hesitation whatever in saying that it is quite the ideal general purpose fowl, inasmuch as it is unsurpassed for table qualities and gives a very good account of itself in the egg business. There are, however, a number of people who seem to think that no fowl is worthy of the description "utility" unless it is a mere egg machine, and possibly quite devoid of type, at that. With such an idea I have no sympathy whatever. One has only to look back at the history of all other farm stock to see how fallacious that idea is. It will be found that in all our flocks and herds, type has made the breed, and I can conceive of no reason why it should not be so equally in poultry.

Double Yolk Eggs.

Three unusual egg records have been established recently in Utah, Oregon and Washington. They are unusual in that instead of being high egg production records, the biddies entered into the contest themselves to see which could produce the largest egg.

It is not unusual among the American type of poultry to find a hen that will lay an extra large egg. But in this record the Washington hen is laying them almost every day. The largest egg she has to her record is eight and one-half inches in circumference by seven inches around the middle. The Utah hen has a record of eight inches in circumference by six and one-half inches around the middle, while the Oregon hen leads with an egg nine inches by seven and one-half.—C. A. Hensleigh, Washington.

Build on a QUALITY Foundation

OAK DALE Single Comb White Leghorns have won most of the prizes offered at Boston and Madison Square Garden shows for the past 20 years and they will continue to be the winners and the leaders because every Oak Dale bird will reproduce itself and, therefore, reliability exists in its breeding.

OAK DALE BABY CHICKS

The usual and natural thing for our May and early June hatched cockerels and pullets is to go into the winter shows and win the majority of the prizes. The pullets from these matings will commence to lay about the first of December.

EIGHT TO TEN WEEKS OLD PULLETS

We offer for immediate sale a limited number of eight to ten weeks old pullets from pens 31 to 65 at these remarkably low prices: In lots of less than 25, \$2.50 each; and lots of more than 25, \$2.00 each.

Age 5 Months-and Laying

Raised The FUL-O-PEP Way

Full of pep because raised the FUL-O-PEP way by Miss Mary Fanning, Nashville, Tenn.

"Jack" and "Lady Bonita," prize winning FUL-O-PEP birds owned by Miss Mary Fanning, Nashville, Tenn.

Hatched March 6, 1920. Laid first egg July 28, 1920. Owned and raised the FUL-O-PEP way by Walton Sadler, Nashville, Tenn.

RAISING poultry the FUL-O-PEP way is becoming recognized the country over as the *one sure way* to poultry success. South—North—East and West, wherever poultry is being raised, Ful-O-Pep Feeds are establishing new records in economical production of poultry meat and eggs.

The six pullets shown above were bred and owned by W. P. Graves, 1302 Eastland Ave., Nashville, Tenn. These pullets were from a flock of 15 hatched Jan. 26th, 1920. Ful-O-Pep Growing Mash was kept before them all the time. On July 2, the pullet marked X began laying. All were laying July 10. From July 2 to July 21, nine pullets laid 87 eggs — week of July 11 to 18, laid 41 eggs. Mr. Graves writes as follows:—

"On February 1st, 1920, I began feeding your poultry feeds (exactly as directed in your most valuable poultry calendar) to a flock of 15 white Orpingtons, hens and pullets. Results were: 101 eggs in February, 257 in March. With several setting in April, they layed 165 eggs — 200 eggs in May and 199 in June. With your feed and your method of feeding and caring for poultry as set forth in your 1920 Calendar, 'Back Lot' poultry raising can be made profitable."

P-15

The illustrations at left are of Ful-O-Pep birds raised by Miss Mary Fanning, and Walton Sadler also of Nashville, Tenn. Miss Fanning is president of the Tennessee Poultry Association and both she and Mr. Sadler have achieved wonderful success in raising poultry the Ful-O-Pep way.

Our free poultry calendar, the book that has been the means of putting thousands of poultry raisers on the road to poultry success, will be mailed free and postpaid on request—write for this book today.

Owen Farms

S. C. RHODE ISLAND REDS
and BUFF ORPINGTONS

Stand Pre-eminent

Their record as the foundation blood for other good flocks all over the World. Their show record in my hands or those of customers of Owen Farms at large and small shows all over this country and abroad. Their individual egg records in trap-nests and flock records as layers wherever they have gone. Their pre-potency, stamina and vigor; and their ability to make good for their owners, have all been factors in establishing their supremacy.

The permanency of Owen Farms' business has been assured by the genuine values given, and the "Golden Rule" treatment accorded to every customer. This is the reason that many hundred orders come back each year from old customers, and why "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism.

1921 Youngsters

are rounding into form very rapidly. You will find here fine husky, perfectly grown January hatch cockerels and pullets in prime shape for August and September Shows. Fully finished pullets and cockerels almost in full feather. Good show cockerels and pullets at \$15.00 and \$25.00 each. Extra good cockerels at \$35.00; \$50.00 and \$75.00 each and pullets at \$35.00 each. A few wonderful birds for the hot-test shows a matter of correspondence.

Selected utility cockerels at \$7.50 and \$10.00 each, with a discount on five or more and pullets at \$4.00 and \$5.00 each. These fine early breeders will not last long. Better order now.

Half Price Adult Breeder Sale

has gone nicely, as usual. You can still find the exact birds you need for next year at one-half their value May first. Take advantage of this summer sale and secure tested breeders for next year. Customers of other years have already had their orders filled.

Owen Farms Service

will mean a lot to you if you will use it. Your requirements will be carefully considered and I will select every bird that goes to you as close to your specifications as possible. A complete record is kept here of every shipment and you can secure just the proper birds from time to time to carry on your breeding. Come here to Owen Farms, if you can. Will talk to you on paper exactly as I would were you sitting beside me at my desk. Tell me your problems and let me help solve them. If you will tell me frankly just what you need and what you can afford to pay, my reply will frankly tell you exactly what to expect. My long experience is at your disposal and will be freely used for your benefit. Write today and find just what it will mean to you to have help from Owen Farms.

TWENTY MILLION CHICKS A SEASON

A Story of the Mammoth Hatcheries—Collecting and Incubating the Eggs—Sorting, Selling and Shipping the Newly Hatched Chicks—Future to See a Mammoth Incubator in Every Poultry Raising Community.

By H. G. Forster

IT was a perfect day in the early part of April. My friend T. F. McGrew and I drank in the sunshine and enjoyed the lovely landscape bordering the Delaware River that extends from Trenton, our point of embarkation, up to Stockton where our good friend, C. Z. Drumm, owner of the Rosemont Hatcheries, Hunterdon county, New Jersey, met us with a welcoming smile. With a feeling that we owned at least half of the world, we sank back into the luxurious cushions of a "real car." As the powerful motor started on its trip to the various hatcheries we were to visit that day, I exercised the privileges of a guest and began to ask Mr. Drumm a lot of questions. I found in a short time that it was better for me to sit still and listen, and to catalog in my mind the numerous valuable points of information which he was giving me from the depth of his knowledge. Here are a few of the things that I learned.

Hatchery Problems.

The story of the hatchery really begins long before the first egg is laid for the mammoth machines. I learned, for instance, that the conscientious and permanently successful hatchery owner exercises a very careful and accurate supervision over the flocks from which he secures his hatching eggs. Being unable to run his own poultry farm, or at least a large enough one, to secure all the eggs he needs for the season, he must safeguard the quality of his hatching eggs in some other way. It is necessary that the flocks, from which the eggs come, be supervised in such a way that the quality of the chicks, in no matter what quantity produced, be not lowered. Without a high standard of quality in the breeding birds, coupled with a tremendous capacity for quantity, the owner of a large hatchery cannot hope to attain and maintain a big business.

As we passed various prosperous looking poultry flocks, ranging in size from a dozen to several hundred fowls, Mr. Drumm would point out and say: "I secure all of this man's eggs for the season," or "I do not get my eggs from him because he does not have the proper kind of stock or will not keep his flock or his houses clean enough to suit me." In addition to giving every flock from which he receives his eggs either personal attention, or seeing to it that his manager does, a still further service is ren-

dered by supplying good breeding males to those who produce the hatching eggs. These males are selected for their vigor, Standard shape and color, and for their blood lines. By supplying such males the hatchery owner is assured of the quality and stamina of the chicks, providing, of course, that the hens mated to them are good fowls. Furthermore all hens on these various farms are either personally culled each year by Mr. Drumm or by his superintendent.

Such supervision and co-operation require the outlay of considerable time and money, but Mr. Drumm assures me that this work is a most vital and necessary part of his business and that it pays well in the end.

The flocks that produce the eggs for hatching are generally small units kept by farmers, and enjoy better ranging and outdoor running facilities than do breeding birds on a large commercial poultry farm. This insures more and stronger chicks. We all know that the small farm flocks are usually healthy, when enjoying the range of a farm and common modern methods of housing, feeding and selection are employed. This robustness, coupled with the proper males, and sanitary handling of the eggs, insures a husky chick.

After the Egg Is Laid.

The eggs are laid, gathered and in a reasonably short time brought to the hatchery. This is either done by the owner of the flock or by someone from the hatchery. Naturally the poultry farms supplying this hatchery are generally located adjacent to it. A distance of 25 miles will cover practically every egg that is produced for the hatchery. Thus the eggs arrive fresh, and being carefully packed, come to the machine in splendid condition. There is no reason why the hatchery egg should not be in as good condition for hatching as though it were produced on a large commercial poultry farm and set in one of the incubators on the place.

All small, misshapen, off-colored, and otherwise undesirable eggs are taken out at the point of production. However, if for some reason the eggs from a certain producer do not come up to the desired needs of the hatcher, he is promptly notified and the undesirable eggs returned. One or two instances of this generally clears up any difficulties, so that we find that the eggs as they come to the hatchery are of very uniform quality. The hatchery is not

Mammoth incubators in a big eastern hatchery.

going to pay a premium price, nor is it going to guarantee purchasing an entire season's output, unless it receives in return eggs that meet the requirements of the hatching business.

The next step, after the eggs are taken from the crates, is that of placing them in trays. The mammoth hatchery naturally incubates eggs of a number of varieties, and great care is exercised to see that they are not mixed. Here are a great number of trays holding only White Leghorn eggs; next to them we see those from White Wyandottes; then there are a large number of eggs from the various varieties of the Plymouth Rock family, and so on down the line.

Egg room adjacent to the incubator cellar. Eggs that have just arrived from the country side are shown in the cases at the right.

A record of the producer, the number of eggs received, and the date of arrival are carefully made, so that when the eggs go into the mammoth machines no confusion is experienced. "A place for everything, and everything in its place," and "a man for each particular job" are the mottoes of a successful hatchery. No lost motions are made, and the eggs travel in logical order from one operation to the other, much as we see Ford cars assembled and run out of the factory on their own power.

The eggs in the trays are kept only as long as absolutely necessary. At the height of the hatching season, when the machines are being used to their capacity, it sometimes happens that eggs are kept a week. However, this is rather the exception. Early in the season the eggs are placed immediately in the machines after being properly recorded. This of course means a better hatch and stronger chicks. The old fallacy of keeping eggs a day to "have them settle" is not countenanced by big hatchers. The fresher the better. So, frequently the hatching egg arriving at the hatchery has seldom time to become acquainted with his neighbors before he is placed in the machine.

The Incubators.

Mammoth hatcheries operate batteries of incubators. The heat for these is furnished by large stoves, and their regulation is controlled by the expansion and contraction of the water in the hot water heating systems, and by the temperature in each egg compartment in the machine. Before the hatching eggs are placed in the machine, the compartment is thoroughly disinfected. No matter how rushed the hatchery may be, no matter how great the demand for chicks, and no matter how valuable each hour, every compartment and all trays in the vast hatching machines are thoroughly cleaned before a fresh batch of eggs is placed in them. Hatching on so large and intensive a scale and with such clock-like regularity, the question of incubator sanitation becomes more than ordinarily important. Sanitary engineers all recognize that the denser the population becomes the more necessary it is to exercise an exact and never-flagging watch over small and large things pertaining to cleanliness. So the hatchery, exercising, as it does, supervision over hundreds of thousands of eggs in a season, must of necessity be more than usually careful as to all possible sanitary precautions. Many have learned the price of neglect, which means disaster.

So the hatching eggs going into the mammoth hatchery machines are not alone graded for size and conformation, but are placed in a perfectly clean compartment and at the correct temperature. This gives them an excellent start towards producing good, strong chicks that do not later break down with intestinal disease.

A Great Hatching District.

Let us leave the eggs in their hatching chamber for a few minutes and continue our most interesting and instructive ride with Mr. Drumm. In the course of the day we had the pleasure of visiting some of the best known and largest hatcheries in the world.

I was told that the larger hatcheries alone in that neighborhood could incubate over 1,000,000 eggs every three weeks in their machines. The astonishing size of the largest ones, and the methods employed in their management are things which all of us who are interested in poultry should know at first hand whenever possible. I saw three hatcheries with a capacity of 250,000 eggs each at one setting. To speak of 50,000-egg capacity machines seemed rather trifling after a visit to those huge batteries of hatching units.

Besides this hatchery center, Ohio is also famed for the same business. In Springfield one hatchery alone can care for over 600,000 eggs at one setting, and the combined hatchery capacity of that progressive Middle West state places it at the top in quantity. California also boasts of large hatchery centers, and there are other points of concentration in our country which are rapidly developing along these lines. Taking the country over, upwards of 20,000,000 baby chicks were sold in the year 1920, a large percentage of which were produced by the hatcheries.

One point that impressed itself upon us was the cleanliness of the surroundings of the hatcheries visited. In but few places were any rubbish or unnecessary objects about. The lack of any particularly noticeable hatching odor was also very noticeable. And it must be remembered that these hatcheries were visited at the height of their busiest season.

Trade Channels for Chicks.

The question is often asked: "What happens to the day-old chicks if there is no demand for them?" We investigated this matter and found that practically every hatchery has some sort of provision for an emergency outlet. They usually have a multiple-unit brooder arrangement which can take care of a large number of chicks for a few days. Furthermore, the better known hatcheries trade chicks. If one finds itself short of a certain number of Barred Rocks, it can safely buy the needed number from a neighboring hatchery. In this manner, and by gauging the demand very accurately, the hatchery is seldom caught with chicks with no place of disposal. Moreover, in the past few years the five (Continued on page 733)

Boxes of chicks at the express office ready to be loaded on the train.

Viewpoints of Breeders on Standard Changes

Orpington, Leghorn and Wyandotte Breeders Manifest a Lively Interest in the Standards for Their Breeds—Consensus of Opinion Is Against the Chapter on Production, Which Was Recently Proposed for Adoption and Inclusion in the Standard

Present Day Orpington Type.

I consider the description of shank in the present Standard for Orpingtons quite correct. "Shanks, rather short, set well apart, stout in bone and smooth."

We must at all times keep the Orpington clearly distinct from the Rock family, and at the same time have the shank conform with the stately, massive appearance of this noble breed and variety.

However, it occurs to me that the tail carriage of the Orpington as described in the present Standard should have careful consideration.

The winning Orpingtons at the large shows today have a lower tail carriage than the Standard describes as ideal, which, of course, is quite deceiving not only to the breeder and exhibitor, but to the purchaser as well, who compares the winners with the illustrations in the present Standard.

The writer personally would suggest that the tail carriage of the male be lowered to at least 25 degrees and that of the female to 15 or 20 degrees above the horizontal.

Ohio.

F. A. Poertner.

The recommendations of the Committee of Forty at the Buffalo meeting to change the Standard on Orpingtons, to require not more than one-fourth of the shank of the male and one-third of the shank of the female to be covered with the fluff of the plumage, is only interpreting that which has really existed in the majority of Orpingtons that are being exhibited at our major shows. Personally, I fail to see the necessity of such a recommendation unless it is to make the descriptive matter more explicit in the Standard of Perfection.

Illinois.

Frank F. Conway.

I am the one who suggested cutting the female fluff down not more than one-third of the shank being covered. In re-writing this, we put it into the male also.

It is true that a large number of males have none of the shank covered, and I am inclined to think that they are better off without any of it covered. On the other hand, I am quite sure none should have more than one-quarter of the shank covered. My idea was to prevent the breeding of very low, loose-feathered birds, especially females, that are acknowledged to be poor producers.

I now have on my place fourteen White Orpington male birds and yesterday I had a chance to look these over, and I find there are only two of the lot in which the fluff comes materially below the hock, and these happen to be two of the best birds that I own. Personally, I am inclined to believe that this question of long fluff extending down and hiding the shank should almost be made a disqualification, as it really is a very serious defect in Orpingtons.

New Jersey.

J. I. Lyle.

I interpret the recommendations of one-third shank for female and one-fourth for male to be the maximum amount to be covered with feathers. It is very true that in a majority of the leading winners of today, none of the shank is hidden from view and a study of the portraits of the leading winners will convince any one that this is true.

This does not make a long legged bird, in fact, some of the best type birds shown are not long feathered. A medium length of feather is to be desired; also slight lowering of tail in both male and female, but the straight

back and horizontal tails to be severely cut. We must keep away from the Rock type, also we must not approach the Wyandotte.

H. M. Wood.

Illinois.

Views of Leghorn Breeders.

The American bred Leghorn as it is today is a splendid example of what intelligent breeding can produce. It has taken us years to bring about this excellent type, color and shaped bird. There are always people who want to alter and shift around the Standard and in many cases they do good. But when they want to put on weight on a Leghorn pullet they do not consider the fact that the Leghorn is essentially an egg type bird; and in spite of the many statements in regard to the eating qualities, frankly I will say that I would just as soon eat a crow.

The addition of one-half pound weight would be apt to make our Black Leghorn show Minorca type and shape. The English breeders have tried to increase size of Black Leghorns at a sacrifice of shape, type, under color, comb, and have as a result a poor looking Leghorn in comparison with the American bird which is comparatively small but of heavy egg producing capacity.

I have always thought that a great many of so-called top-notch experts on poultry were simply those who could not make money raising poultry themselves, but could make a living by going around and telling others how to do it, or by sitting comfortably in some nice city office and doping out some new scheme to make the breeders, who are really trying to breed something, work harder. A few people can make a rule that will take many people four or five years to live up to. Poultry cannot be changed in a minute from one size to another. Frankly I fail to see where any advantage would be obtained by increasing weight on Black Leghorn pullets.

Massachusetts.

Waldo Robinson Bryant.

I have read with a great deal of interest the changes in the Standard proposed by the Committee of Forty, and was especially interested to learn what their recommendations were in regard to the Leghorn Standard, as I have heard more about changes to be made in this breed than in any other.

The Standard says that the Leghorn "comprises a group characterized by rather small size and great activity. Leghorns are hardy and prolific. The males are very alert in carriage. The females are non-sitters, very few of them show a tendency to broodiness." What more can we ask of a breed? It has always been my contention that if a breeder or fancier wanted a much larger Leghorn than is called for in the present Standard he should choose some other breed.

I have always felt that we should be very careful in making changes in our Standard because I feel that the Standard is made up of opinions and experiences of our most able breeders of the past and the present, and it is much easier to tear down than it is to build up.

However, I do not think that the increase of a half pound in the weight of pullets will harm them. But I surely would be disappointed if the weights of Leghorns should be increased from one to one and a half pounds, as has been suggested by some of the utility men.

We all like plenty of fresh eggs but there are thousands of fanciers that like beauty and utility combined. Those that have had experience with the present Standard Leghorns are well satisfied with the utility qualities. (Continued on page 737.)

SUMMER CARE OF YOUNG STOCK

Handling the Growing Pullets That Are To Be the Winter Layers—Prevention of an Autumn Molt in Pullets—What to Feed Growing Pullets—Quantity and Kind of Feed Required for Winter Eggs.
By Lloyd W. Steelman

DURING the past few years I have found that without doubt our most prosperous poultrymen are the people who have the ability to use correct methods of brooding and rearing of chicks and who obtain the required number of vigorous, healthy pullets. The aim of every individual who raises chicks is to get them to develop the desirable traits inherited from their parents. Unless these birds are carefully and properly grown under ideal conditions, they will be stunted, improperly developed and will not be as profitable as they really should be.

Did you ever stop to consider how delicate a piece of machinery a chick is? When it comes out of the shell it weighs one and one-half ounces and when it becomes six months of age it will weigh nearly sixty ounces, depending on the breed. In six months' time it increases its weight forty times. Suppose a baby would grow as fast. When a baby is born it weighs eight pounds and in six months if it would multiply its weight forty times it would weigh 320 pounds—yet we know that a baby must be given such good care.

In order for a chick to make such rapid growth it is necessary for us to do all that is in our power to keep the chick growing and not retard its growth by our neglect. A chick is unlike a calf which one can slight for a day or so with little or no ill effects. If a little chick is forsaken and neglected for a single day, it may be a failure for life for it has lost a quality of vitality which cannot be regained. Thus by neglect we may make a ruined chick for life or change a 200-egg bird into one that would only have the vitality to lay 50.

Rearing Practices.

The chicken can be placed on the growing range at the end of eight or twelve weeks. By this time they should be matured to the extent that artificial heat is no longer necessary. It is well to have them in colony houses with plenty of free range. Feed a good scratch grain and mash mixture. Scratch grain: Two pounds cracked corn, one pound wheat. Dry mash: Two pounds wheat bran, one pound wheat middlings, one pound cornmeal, one pound ground oats (with hulls sifted out), one pound high-grade beef scrap.

In addition to this allow the birds to have all of the milk they want. Should milk not be available, add one pound dried buttermilk to the mash mixture. Some form of milk should be fed to the chicks such as sour milk, buttermilk, semi-solid buttermilk or milk powder. These different forms of milk contain materials that provide a dietary property, which, if it should be entirely absent in the ration, proper growth could not be obtained. Feed milk during the first six weeks of a chick's life and if possible feed it for the first six months. I would not attempt to rear chicks unless I could feed them some form of milk.

A good method of feeding pullets, based on one hundred, is to let them have one to one and one-half quarts of scratch grain, scattered well about the range, in the morning, then one to one and one-half hours before roosting time feed them about six quarts or all that they will clean up, and allowing the mash before them at all times. The morning feed will not be sufficient to satisfy their wants; this will make them work and scratch for more; they will try to satisfy their appetites by

devouring the mash during the day, then by feeding two-thirds or more of the grain in the evening, they will go to roost with a full crop. The pullets should consume equal parts by weight of scratch grain and mash.

Should a person's time be limited so that it would be impossible to feed the scratch grain by hand, feed it in open hoppers the same as the mash is fed.

Free Range.

An ideal condition is to provide plenty of free range where the birds will have an opportunity to obtain plenty of exercise. The area should be large, at least one acre to 300-400 pullets. If the soil is very porous, as a sandy or a sandy loam which has a good growth of alfalfa or clover, 500 pullets may be kept on the same acre. A field of alfalfa which has been well seeded will care for 300 pullets without being destroyed, as the plants will keep growing continually. Should the space be limited, it is advisable to have two or three lots which are plowed down and then planted with some green feed, as rye, wheat or oats on one plot, rape on another and buckwheat and oats on another. This simple method will provide plenty of green feed for all summer.

Shade should be provided by some means. The rearing of pullets in an orchard is an excellent practice as this will afford plenty of shade. More birds suffer from overheating during the summer than from the severe cold in the winter, there-

fore every effort should be made to provide plenty of shade. If no trees or sheds are available, make little inexpensive frames out of boards about 18 to 24 inches high and about 3 feet square, covered with leaves or grass, as they need not be rain-proof.

It is the practice in a great many places to place the colony house in a corn field and let the birds obtain their shade from the plants. The plants give off moisture which makes

the air cooler than if the chicks were given shade under small sheds.

Developing Pullets.

It is not a good practice to force pullets which are intended for egg production. If they are forced they will not grow the large-sized frame that a good layer must have. A good frame is absolutely necessary in order for them to be in good condition for winter laying. Too often we see the results of forcing Leghorn pullets into laying, after such a bird completes her first laying year. She weighs $2\frac{1}{2}$ to 3 pounds when she should weigh 4 to $4\frac{1}{2}$.

A serious problem that confronts most poultrymen is how to feed pullets so that they will grow and become large, strong fowls without beginning to lay too young. The quick maturing ration which is fed to the pullets is also a forcing feed. Such a feed should not be fed to the pullets continually, when they are three to five months of age, as it will induce them to come into laying before they are properly developed. Should there be no change in the feeding methods, the results will be disastrous to a good flock; and we will have small pullets laying small under-sized eggs with little or no market value. Such a bird has not made its complete growth and will tend to grow and lay eggs at the same time. Few birds, if any, can stand the strain. If they are permitted to make

The law of nature is growth, but the growth stimulus is lower in some chicks than others. The above two Rhode Island Reds were hatched in the same brood and both are the same age, six weeks.

their full growth first, they will lay more eggs having a larger size and will be in such a condition as to stand the winter which is ahead of them and will continue to lay into the late summer or fall of the following year.

Proper feeding of the birds will control this problem to a considerable extent. The use of over-stimulating rations is the cause. Those which contain too easily available concentrated foods, such as meat, finely ground grains—particularly those which lack bulk—and are high in protein, are considered narrow rations, commonly called "forcing."

One of the best methods to use in caring for the pullets that show signs of laying and are under-developed is to separate them from the rest of the flock. A young bird shows signs of laying when it begins to "bud," or the comb enlarges and becomes bright red in color, as does the face and wattles. Place them on grassy range and feed them a grain scratch food composed of cracked corn, wheat and whole oats, about equal parts of each. Twelve to fourteen pounds should be fed to 100 birds per day. Feed three pounds in the morning, three pounds at noon and six to eight pounds about one and one-half hours before roosting time. Such a food will not cause them to develop their sexual functions so rapidly and naturally not induce them to lay. This will give them more time to develop a good frame and add a surplus amount of fat.

As soon as they have reached normal size, they can be started on a feed that will induce them to lay. Place a good mash before them at all times—equal parts by weight of corn meal, wheat bran, wheat middlings, ground oats (heavy) and beef scrap. If they are slow about beginning to lay after being fed this feed for a week or more, let them have a wet mash before noon each day. If possible moisten this mash with milk. This is rather forcing and will induce them to come into laying with little or no delay.

Cause and Prevention of the Fall Molt.

A great deal of money is lost every fall and winter by the average farmer or poultryman due to his flock going into a fall or premature molt. Some birds come into laying in September, October or November, lay a few eggs, stop laying, go through a partial molt, and often do not come back into laying until late in the winter or early spring. There is usually a reason for this molt, and we should use all precautions in avoiding it.

One of the main causes for the molt is due to the birds coming into laying too young and before they are properly developed. For instance a pullet may come into laying at four and a half months of age. She is undeveloped and will be under weight and under size for the breed she represents. She has enough energy and fat in her body to produce fifteen eggs. She will lay these fifteen eggs, then quit laying. It is common when these pullets cease to lay in the late summer, molting follows. Or a bird may come into laying at six months of age, have a fairly good frame, but lack in weight, thus not having a great deal of surplus fat, but just enough to produce twenty eggs. She will lay the twenty eggs then take a rest which is accompanied by a molt.

Have the birds properly developed, with good frames, and of a good weight of bodies, which will be around three and a half to four pounds for Leghorn pullets and proportionately heavy for the larger breeds. This will mean enough surplus fat in their bodies so as to put them in excellent condition to stand the cold winter and at the same time provide that reserve amount of material to enable them to lay throughout the winter, and then with the coming of spring to keep on laying until the following summer or fall.

Place the birds into their winter quarters a week or two before they begin laying for if they are changed after they begin laying, a molt is liable to result, which means a couple

of months of low egg production. Avoid abrupt changes after the birds begin to lay.

It should be added, and strictly observed, that it is not desirable to make an abrupt change in feeding methods. If a change in feed is desirable, make it gradually, taking ten to fourteen days to make the change. Little or no ill effects will result if this method is followed. A change to a too-forcing ration, one too rich in animal protein, is likely to throw the birds into a molt. At first the birds may go up to seventy to eighty percent for a couple of weeks, then go into a molt. This can be overcome by not allowing them to lay above fifty to fifty-five percent, by holding down on the amount of beef scrap or milk or other forms of protein that are being fed. It is better to keep the birds at fifty percent for ten months rather than seventy-five percent for two weeks, followed by a month or so of few, if any eggs, for when a pullet is shedding feathers she will lay very few eggs, if any.

The over-use of artificial lights is often the cause of pullets molting and the egg yield diminishing. Start the lights on gradually in the fall and lengthen the day by five minutes or so until a twelve or fourteen-hour day is obtained. To immediately give the birds a fourteen-hour day on November 1 is an abrupt change which may cause some of them to go into a partial molt. Moreover, if the lights are run too long, morning and evening, the birds may molt in January or February. Normally the molt would come in the following summer, but there is an artificial stimulus about the lights that not only sets egg laying ahead into November and December, but if overdone will also set the molt ahead.

Feeding the Layers.

Much of the success in fall and winter egg production is obtained from a bucket full of feed in one hand and a bucket full of common sense in the other. Feeding the laying hen is a real art, for so much depends upon the poultryman's decision each day in the matter so that his birds will work most efficiently. The feeder is a skilled mechanic who systematically hold his birds up to fifty to sixty percent production from November 1st

An ideal summer range for growing stock and colony houses nicely placed. Plenty of shade under the fruit trees, and an abundance of green food in the pasture.

to the following fall, without causing a slump in egg production and at the same time maintaining their health and vigor.

One of the first prerequisites in feeding is to understand what the egg consists of. It is made up of a yolk, white, shell, and is two-thirds water. The yolk is fat and is made from feeding fatty or starchy foods, as corn, wheat and oats. The white is animal protein, which is made from material such as meat and milk. The shell is made mostly of calcium which is found in certain kinds of stone and oyster shell. In order to aid in the digestion of all of these foods some bulk is desirable which is green and succulent, such as sprouted oats, mangel beets, cabbage, etc. In order for these foods to be properly digested an abundance of grit should be available, as this acts as the hens teeth in grinding the feed in the gizzard. Water is cheap. Have it before the birds at all times.

Now put these principles of feeding into practice, let me suggest the following rations:

Scratch Grain: 100 lbs. cracked corn, 100 lbs. cracked wheat, 50 lbs. oats. Dry Mash: 100 lbs. wheat bran, 100 lbs. wheat middlings, 100 lbs. corn meal, 100 lbs. ground oats, (heavy), 100 lbs. high-grade beef scrap. Feed to 100 pullets: 1½ to 2 quarts of the scratch grain in the morning in six to eight inches of dry litter, with the mash in open hoppers before them at all times. Then feed six to eight quarts about one and a half hour before roosting time. The morning scratch will not be all that they will want and will make them scratch for more grain. This will give them exercise; they will still be hungry and will eat the mash, and then by feeding them all of the scratch grain that they will clean up before going to roost, they will retire with a full crop.

Studying the Color of a Beautiful Variety

Do Not Breed Merely for Intensity and Quantity of Under Color—Study the Shades of Color in the Under Plumage—Observe Their Relation to the High Color Desired in the Surface Plumage.

By Geo. W. Mitchell

I HAVE been especially interested in the article by Rev. T. W. Harwood on "The Undercolor Question," in the May number of A. P. J., also in your editorial referring to same. Keep up the good work as the young breeder needs to understand that it is the sheet of surface color that is spread to the sunlight for men to look upon and admire, and that the undercolor should be subordinate to, and consistent with, the surface color.

If I rightly recall, nothing was mentioned in the early issues of the A. P. A. Standard in regard to undercolor. Then well onto twenty-five years after the issue of first Standard, the policy came in vogue of writing descriptions of the feathers for their entire length, clear down to the skin.

How vividly I remember the efforts on my part, in committee, over the question of prescribing a dark slate undercolor for Partridge Cochins, as it followed the idea of "barred to the skin" in Barred Plymouth Rocks.

It seemed as if nothing but "black to the skin" was satisfactory to most of the young breeders of Partridge Cochins of those days. They were in the majority, yet knew but little of the ins and outs of successful handling of this variety. And a very large number of the judges of those days were in a class with the young breeders.

After dark undercolor for Partridges became embodied in the Standard text, the judges leaned so far toward a black-to-the-skin conception of the Standard that it was really painful to the breeders of wide experience. The result was one failure after another among those who took up the breeding of this variety, for they were influenced to make a fad of dark undercolor as a result of the fashion among many judges to give the preference to such birds.

Influence of Undercolor on Surface.

A large number of breeders dropped out, leaving only those who knew that males which were black to the skin in undercolor of hackle and saddle would breed poorly penciled females, to say nothing of the great loss of the finely blended shade of mahogany in females. And contrary to general expectations, these heavy undercolored males frequently produced males showing white in tails, wings and feet, and the still greater objection of bluish-purple in what should be a greenish-black breast and wing bar.

The Barred Plymouth Rock breeders, in adopting barred undercolor all the way down to root of feather, made a very wise choice, for it permits a blending of the different shades of undercolor to bring about what they desire. My own success in breeding Partridge color is in no small measure due to my close study of the different shades of undercolor and a blending of those tones; but all must know that to bring about black to the skin in Partridges requires the use of solid black and no blending of the softer tones is possible.

The Partridge variety has a brilliant surface color, and it is a well known fact that a black undercolor is the direct opposite of what nature provides in all birds of high surface color.

How far we may be able to depart from nature's laws, we are unable fully to determine. If it were a case of inbreeding, and you said that consanguineous matings were unnatural and harmful, I could point out that it has been my experience that we can continue to mate birds of blood relationship from the same descendants for many years, as we have demonstrated by our not having introduced into our yards any new blood whatever in twenty-seven years. But, how far we can depart from nature's laws of inheritance and transmission of beautiful color, has been equally well demonstrated to be an entirely different matter; and from my point of view the breeding of a compatible and not self-contradictory undercolor

is the key to the whole situation pertaining to the production of satisfactory surface color, penciling, etc.

Striping in the Female's Neck.

I should add, however, that it is highly desirable that the markings of the different sections of the plumage should be consistent with one another. I have in mind the neck section of penciled females. A solid black stripe in the neck plumage of Partridge females is very much admired, and at one time required by the Standard. Such a stripe is very easy of attainment, but to continue to use striped-necked females as breeders, for only a few years, has always been the means of losing the clean cut and beautifully distinct penciling that all Partridge females must have over their back and wing bows to be at all satisfactory.

Messrs. Felch, Babcock and Lee in their work, "The Philosophy of Judging Fowls," published in 1889, speak of the solid black stripe of Partridge Cochins, which was a Standard point at that time. These authorities of the day said:

In the necks of females the defects are almost invariably penciling of the black stripe in the hackle. It is safe to say that prime penciling upon the back, breast and wings is never found without more or less penciling in the hackle. As this is a defect that accompanies the greatest excellence in the variety it should be cut lightly.

In the above words, recognized authorities of their day made due allowance for consistency of markings. Many young breeders, as well as judges of few years' experience, have often said to me that the Standard requires the use of inconsistent points in the makeup of our matings. Right here is where I feel that they have made a mistake in their interpretation.

It was my good fortune, as a young man, to have the personal acquaintance of nearly all the gentlemen who for many years were interested in the writing and revising of all the early issues of the Standard. I am quite sure that they realized that the aim of their work was to describe what would be accepted as an ideal; and all the while they knew that every thoughtful breeder, in bending every effort to attain that ideal, was working with raw materials that would ultimately enter into the finished product; and that the successful mating of the birds to produce the ideal depended largely upon the breeder's knowledge of the blood lines in his birds and upon their breeding tendencies.

As blood lines and breeding tendencies in the different varieties have become better known and understood with the passing years, the Standard ideal should be based less on speculation. That we find to be true in the matter of female hackle, the present Standard requirement being: "Neck: Reddish bay; center portion of feathers black, slightly penciled with mahogany brown." This means that the penciling of a wonderful hen may run into the neck hackle, and not be expected to stop off short and positively black-centered neck striping begin.

And in the matter of undercolor, which has been a hardy annual for many years, I should like to make a further statement: The permanent undercolor, if the variety that wears it is to be permanent, is the one that blends with and serves to build up the correct tone and quality of surface color; and this is the ideal undercolor, regardless of any arbitrary requirement which the Standard may temporarily make.

Some Early History.

When I first entered the poultry fancy, in the winter of 1873, I took up the breeding of Partridge, White and Buff Cochins. I had always been a lover of nature and was aware that a solid black fowl showing any disposition to sport feathers would show white, and that a white fowl would be likely to sport to black. This suggested the study of shades of slate undercolor, which slate color (Continued on page 730)

Sicilian Buttercups a New Standard Breed

Early History of This Variety—Bred Up to a Standard by American Breeders—Progress Retarded for a While by Too Many Standard Disqualifications—Well Balanced Specimens Are Today Being Bred and Shown.

By F. L. Platt

NEARLY half a century ago, F. H. Ayres, living in the old seaport town of Mystic, Connecticut, issued a little book in which he stated that Sicilian fowls had been received in America before the Leghorns were brought to our shores by the old whalers. The earliest date assigned to the introduction of Leghorns is 1855, when an importation was received at Mystic River, Connecticut. The Leghorns came from Italy. Buttercups are Sicilians from the Island of Sicily, which is the largest island in the Mediterranean, and belongs to Italy.

Leghorns in America, from the very first, increased in popularity and multiplied in numbers. The Sicilian fowls continued to be known until about 1865, when they dropped out or disappeared by being absorbed into the common stocks of the country. Then in 1882 a Mrs. Kremmerer received some eggs for hatching from Italians living in a mining district of Sicily. It was not until 1897, however, that the breed was finally established in America. In June of that year, Rev. A. B. Browe of New York State received as a gift a trio of Buttercups from Medusa, Sicily.

The breed was brought before the public in a general way by James S. Dumaresq of Maryland, who was in the diplomatic service in Italy during President Cleveland's administration, at which time he was attracted to the Sicilian Buttercups and took up the breeding of them at his summer home, a villa on the hills of Florence.

Breed is Established in America.

Upon his return to America he continued to breed Buttercups, and about 1907 became active in an effort to introduce and popularize the breed with American poultry keepers. He died in 1909, but his widow made the first exhibit of Buttercups at Knoxville the next year; and she had quite a large exhibit at the Appalachian Exposition in 1911, after

which she wrote me that "the birds attracted much attention and were much admired."

Mr. Dumaresq secured his stock from a nice flock of these birds which were bred by an Italian peasant living in a little village south of Palermo, the capital city of Sicily. The breed is not a mere common type to be found in abundance anywhere on the island. In February, 1913, Franklin S. Fifield, of Ohio, wrote me from Messina, Sicily, where he had gone in quest of Buttercups, that "as to the kind of chickens these people breed, I defy any American breeder to tell, as I have seen a bigger mixture than I ever supposed existed. Now as to Buttercup type. I have found some fine specimens, but never more than one to a flock. Many anxious breeders in America have written to the American Consul at Palermo, and have made him think that there must be a great breed of chickens on the island, so he found a man by the name of Renzi, who went out to find some of these birds, and finally landed six birds. He did not find any two in the same pen, so you see it took many days of hard searching to get those six."

That actual experience of Mr. Fifield in going to Sicily to get the pure quill, is similar to the experience of those who have searched in vain for modern Anconas in the vicinity of Ancona, Italy. It is a fact, too often overlooked, that it was fanciers who took up the early Anconas and Buttercups and bred them, culled them and established them as breeds; it was fanciers who went into the Little Compton district of Rhode Island and selected red fowls that became the progenitors of the Rhode Island Red breed; it was fanciers who took the dominique colored denizens of the farm yards of New England and bred them into Barred Plymouth Rocks. Fanciers have made our breeds, often working with (Continued on page 732)

Chart showing correct shape and feather markings of Sicilian Buttercups.

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

The Growing Chicks

Artemas Ward once stated that he had been "deppertised to go out as a senses taker. Sitting down by the road side," said he, "I draw up questions to ax the people I visited." One of these questions for the census was: "How many chicks have you on foot and in the shell?"

A reader of American Poultry Journal writes that the number he has "on foot" is diminishing. It would seem that these chickens are given the best of care, for our subscriber writes:

I have been raising chickens with colony brooders for several years. Secure my baby chicks from the Elliott Poultry Farm. Have visited Mr. Elliott and know he has fine stock, kept under splendid conditions. Chicks come in fine condition and start growing and thriving at once.

I never have any complaint to offer until about the sixth week, when a few will begin to droop and die, and each year the trouble grows worse.

Now I will try and describe how the chickens are raised. We usually place five hundred together. The house is thoroughly sprayed and disinfected previously. Have a scratch room, and get them into it by the time they are one week old. Start them on a buttermilk starting feed with clean water, grit, charcoal. Because we handle feed at the elevator we do not attempt to mix any, but feed the commercial feed. Handle several standard makes and all are good.

Put the chicks on the hopper by the time they are two weeks old. Feed scratch feed morning and evening, and a moist feed at noon composed of the commercial mash moistened to a crumbly stage with sour milk.

I give them green feed once a day and get them out into a small yard just as soon as weather permits. Lime and crop this yard two and three times a year. Quarters are cleaned every week and sometimes oftener. Use O. K. litter in the brooder room, chaff in the scratch room; board floors in both rooms, entire house 10 x 24 feet. Had not lost over 15 out of the 500 up to the six-week age. At least half the flock is now affected. Have now lost 50 of them the past two weeks. No lice or mites.

They first begin running stilted, will sit around, but lively enough if you try to catch them. Some of them droop around for two weeks, eat and drink somewhat up to the last day or two. Wings hang and head drawn in. Always look worse in the morning, and by night the flock will appear much improved. Are running on range now, but we have only a small place, 2½ acres in all. They have all but the garden and door yard, besides a wide right of way along the side track which leads to the elevator and which amounts to at least one acre more, and is well sodded.

Each year this trouble grows worse, and in spite of all our precautions it will show itself by the sixth week, but not enough suffer from it at one time, among so many, for a stranger to notice. Will lose at least 200 from this flock. What is the answer?

Another letter reads: "What is wrong with my Single Comb White Leghorn youngsters? They look healthy, but in the morning some have their wings hanging down, and some are dead." The writer of this communication then proceeds to describe his methods of rearing, which are modern and practical.

We saw a case similar to this last week, and the whole trouble appeared to be a lack of fresh air in the roosting quarters. While the birds were housed in an open front house, a number of them huddled together in a back corner, and those on roosts were above a droppings-board in the back of the house. There was not nearly enough air circulating around those chickens during the night.

We suggested that a roost be placed near the wire openings in the front of the house. The poultry keeper did this, and also increased the quantity of bran in the dry mash that these birds were getting. Within a few days there was a marked change in the appearance of his birds, their wings went up into place, their ruffled feathers laid down, diarrhea stopped, and mortality decreased to zero.

If our correspondents would likewise provide more ventilation, actually get a circulation of fresh air from out of doors through that part of their poultry houses in which their six or seven-week-old chicks are roosting, they would overcome and prevent the trouble they are experiencing.

When chickens are very small, they do not need so much air, but after they are six or seven weeks of age, become fairly well feathered, and are digesting a great deal of food, they need more air, just as a stove must be fed 11 pounds of pure air through the fire for every pound of coal burned, and 44 pounds of air when four pounds of coal are burned. Dead coals in the stove in the morning are the result of closing the fresh air draft too tightly.

With a temperature of 106 degrees the vital fire of a chicken burns brightly; it lives at a rapid speed; and it

requires more air than other animals. For every 34 pounds of air that man breathes, an equal weight of chickens requires 64 pounds of air, or nearly twice as much.

In addition to chickens taking in and giving out relatively large quantities of air, the quality of the air should be considered. The copious droppings of large numbers of growing chickens rapidly vitiate the air in a close coop, and the air is also rendered faulty by the relatively large amount of moisture that is exhaled in a chicken's breath, which tends to make the atmosphere in the coop close and muggy.

Chickens are a species of birds. And birds, where do they roost? Out in the open air. They are surrounded by air, and the wind blows over them and under them. Nature gave the great out of doors to birds, and provided them wings to soar through the air.

There is too much of a tendency on the part of poultry raisers to conserve heat, to protect from draughts, and to cut out the essential outdoor air from growing chickens.

Some of the best birds we have ever reared, those that grew best, and feathered sleekest, and made the most profitable use of their feed, have roosted during the summer in lilac bushes or under a shelter of grape vines. Before they left the brood coops, which had wire fronts, the roof was raised in the rear to provide a circulation of air across the box to quickly and completely carry away air that had been once breathed. If, after weaning, these birds went to colony houses on the range, the roosts were removed from the rear of those houses, and placed close to the air in the open front.

Freedom from lice, plenty of feed, a good supply of green stuff, fresh ground, are important. But air also is important, and there is no charge for it. It is one of the freest things in all nature.

Do not crowd the chicks, but let plenty of air circulate all around them, as is the condition enjoyed by birds in a tree, and you will have chicks that are fresh and active in the morning, not droopy.

When 150 Chicks Are Worth While

An item appeared in print recently to the effect that "Clif. Nickerson has about 150 chicks down among the sand hills, growing like weeds."

What is there about one hundred and fifty chickens to bring forth comment? Some of them are only partly grown, some are quite small, and all of them came out of hens' eggs.

The answer is that last year Mr. Nickerson sold three of his Buff Orpingtons for \$450. The birds he is growing this year have the same blood in their veins and will produce more of this fine Standard quality.

It is not uncommon to hear of sales made at highly remunerative prices by big breeders of national reputation. We refer to Mr. Nickerson because he is not so widely known; and the new man in the purebred poultry business wants to know what he can do by securing good stock, studying it, mating it wisely and growing his chicks with care; he wants to know what he can accomplish without the asset of a nation-wide reputation.

He can do what Mr. Nickerson has done. There is a standard of excellence which is understood and appreciated alike by all breeders, and the man who produces chickens that approximate closely to those ideals will find that there is a sale for his birds on their merits.

Reputation is not necessary for the small breeder. All he needs to do is to produce the proper quality. Then the birds themselves will stand up and speak in their own language, more elegant than words, and all judges and breeders alike will pronounce them good.

An example of what the small breeder can do is found in the case of Geo. Gable, an engine man on the Lake Shore R. R. who breeds Buff Leghorns in a city backyard.

He exhibited a hen at the last Chicago show which won first. We commented on this hen in our report of the

Chicago Coliseum show, as follows: "A wonderful class of Buff Leghorns. First hen, softest colored, best shaped Buff Leghorn hen ever seen at Chicago. A hen without a fault."

Mr. Gable is not an advertiser in these columns, never was, and probably never will be, for he breeds in a very limited way. We spoke in words of praise of his first prize S. C. Buff Leghorn hen because of her superior quality. It is our policy to give credit to whom credit is due, regardless of so-called self interest. We may err, but that is the policy we mean to live up to.

Within a month after the Journal carrying the Chicago show report was published, Mr. Gable received several letters asking if the bird was for sale and at what price. One breeder in the east made him a flat offer of \$100 for the hen, although this eastern breeder had not seen her.

Mr. Gable needed the money, but he also needed the hen in his breeding operations, and he kept her.

The good fancier and constructive breeder loves his birds. He inventories them as his most valuable personal property. Today the need is to bring to life in the minds of new breeders that love of the purebred bird which has animated all great breeders of the past, and without which no beginner may expect to permanently succeed as a fancier-breeder.

Breeders of this kind did not inspire the timely note sounded recently by the secretary of the New York poultry show: "Sad will be the day when the beautiful is sacrificed for commercialism."

Breeding, of course, cannot be all personal satisfaction—nothing more than a personal gratification of the fancier instinct. Breeders have to buy feed, just as artists have to buy oils and canvas. Both breeders and artists must make sales from time to time. It was natural, therefore, for Mr. Gable to write under date of May 21:

I have now bred this hen two years and she is very satisfactory as a breeder, but I have been and am getting inquiries from breeders wanting to buy her, and I think I will let her go, providing I get \$75 for her. I was offered \$100 last winter, but I wanted another season out of her. Now I have what I wanted. This hen will have to bring me that much money (\$75) or I will keep her, as her youngsters are good and very good sellers.

Seventy-five dollars for a three-year-old hen! That sounds pretty good and it may appear to the young fancier that the breeder who has produced such a specimen has reached the highest round of the ladder as a backyard fancier. Mr. Gable does not think so. He still observes points that he would like to improve, he still aspires to advance the quality of his birds.

Last winter at the Madison Square Garden show, we found him standing in front of the first prize young pen of Buff Leghorns. He had been deeply impressed with the length of body, furnish of tail and unusually rich buff undercolor of the male at the head of that pen. He knew it was useless to attempt to buy that male, but he had picked one pullet, out of the four pullets in the pen, that had uncommonly well developed tail coverts. Pointing to this bird he said. "There is a pullet I want to buy. She is of the same line as the male. He is a wonder."

"What is he holding the pullet at?"

"I can't get him to put a price on her."

All week, up until the closing hours of the Garden show, Geo. Gable sought to buy that female. Other breeders might admire other birds in the class, and there were many fine ones; but George knew that, in breeding, males were important, that the head, back, breast, station and color of females were important; but most important to him at this time was the tail end of this female which was so richly furnished with coverts. He believed that, if only he could purchase her, she surely would stamp a wealth of tail plumage on his males.

At last Monmouth Farm agreed to make the sale, and George left the Garden happy. He now writes:

I lost that wonderful pullet that I purchased at the Garden last winter. But I was lucky in that she was a great layer. I have 14 chicks from her and the fourth Chicago cockerel. Seven of them are quite large, and two of the seven have been crowing for the last three months and look quite promising in the section that I was

working on. I had been looking for this kind of a pullet for a good many years, and then after I found her I only had six weeks of pleasure from her. That was a disappointment, but it could be worse.

In this quotation from an interesting letter is to be found the whole story of a fancier's constructive breeding efforts. First is a deep and abiding interest in the birds themselves; second, the vision to foresee probable results of a union of two birds; third, to appreciate and understand quality in the youngsters before they are two-thirds matured and growing their sickles, that the more promising of them may be given every advantage of coop room, yard space, and close attention.

It is this interest, study, and work that makes a fanciers year. It is these things that combine to produce in one hundred and fifty chickens that elegance of form and perfection of feather which makes them worthy of a season's efforts.

Reserve Some of the Good Breeding Hens.

No breeder can progress until he gets a background of hens in his pens. These matrons have the maturity and the constitutional capacity to lay eggs that will produce strong chicks. They have age, and every weakness of color, type, or constitution has had time to assert itself.

We all take an annual interest in baby chicks and hatching eggs. They represent the present. Old hens are of the past. It is natural to expect that the new generation will show an improvement over the old. Unless we had hope of advancement in each successive generation, there would be little interest attached to bringing forth a new crop of chicks and growing them out.

But sometimes we get in too much of a hurry. Fresh feathered young birds fill our eye, and in our haste to let them predominate in our yards, we discard the seasoned breeding material that we have.

It should be borne in mind that a year or two does not finish a hen.

As a pullet, she is not in her prime as a breeder. As a two or three-year-old, she is not aged. A pullet, one year old, may lay eggs that weigh 24 ounces to the dozen; as a yearling (two years old) her eggs will weigh 25 ounces; as a three-year-old, she

will lay eggs that weigh one ounce more, or 26 ounces per dozen eggs. In other words, as a three-year-old she puts more meat in her eggs than she did as a pullet, and the embryo chick, which is to be the new generation, builds its body in proportion to the quantity of material in the egg. It should not be a question of using a hen only a year or two and then discarding her.

The practice of culling out hens after the first, second or even third season has sometimes resulted in eliminating some of the best breeding birds in the flock.

Yesterday we saw the hen that damed the first Barred Rock cockerel at the last Chicago National Show. She is five years old, and has as smooth a shank and fresh a head as a yearling. As a four-year-old, she produced that elegant cockerel. She has again produced a number of chicks this year.

A subscriber in Michigan writes that he has a 5-year-old hen that has laid 1,131 eggs. That is more than 200 eggs a year for five years. What if she had been culled out as a two or three-year-old? No ordinary pullet would have taken her place and given an egg yield equal to this hen's production. Our correspondent states that a number of the hen's eggs have been incubated each season; and it is to be expected that many of the pullets from this dam will inherit her longevity, a valuable point in itself.

We were interested lately in reading a communication from William Ellery Bright, in which he said that a Brown Leghorn hen of his, old Brown Plush, produced chickens when she was 14 years of age, and the year that she was 11 years old, he raised 60 chicks from her. Mr. Bright is one of the greatest Brown Leghorn breeders that America has ever known yet he did not make progress so fast that his breeding hens got out of date.

Dr. W. H. Harwood, New York State, in issuing a recent circular, illustrated it with a Dominique hen.

The picture is reproduced herewith. This old hen, Grandma, was one of three hens to live to be over 15 years of age. Dr. Harwood states that she raised 22 chickens the summer before she died.

Hold onto the hens of good quality and good substance. Do not rush them off to make room in the breeding yards for pullets. When you need a new bird for the breeding pen, buy a good hen.

Grandma, a 15-year-old Dominique hen, owned by Dr. W. H. Harwood, New York State.

Now is a good time to buy hens. It is also a time when cocks can be purchased at less than their real value. There is always a time to buy—a time when it is cheapest to get in. In the summer, birds are in old feather and are not so attractive, and it is possible to get a \$35 male for \$25 or a \$25 female for \$15. The accompanying chart shows this seasonal fluctuation in value.

The summer is an "off season," but for those who want to save in actual cash outlay and at the same time secure good breeding birds, there is no time like the summer to buy. In order to make room for the oncoming young stocks, breeders are often forced at this time of the year to sell mature birds with which they would not have parted earlier in the season.

Statistics on the Egg Situation.

The laws of trade continually urge upon the buyer the need of buying cheaply; whereas the interests of the seller lie in selling on a high market.

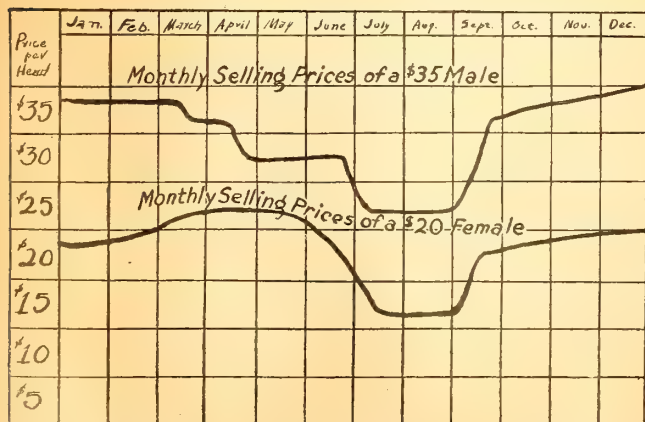

The buyer "bears" the market. It is legitimate that he should do so. The seller should "bull" the market. It is to his interests to do so.

During the spring season just passed, the big commission buyers of eggs have successfully carried out a regular "bear raid." Instead of meeting opposition from the college professors and poultry papers, whose business it should be to represent the interests of producers and at all times support the egg and poultry markets with facts and argument, these agencies have appeared to be ready to accept the propaganda of the buyers at its face value and pass it on.

As a result, commercial poultrymen have seen bogys all spring. Any time that a boggy-man has failed to appear climbing over the poultry fence with an empty bag on his back, somebody has seemed to be ready to take the joy out of life by cutting a hobgoblin out of whole cloth and stuffing it for the special benefit of the commercial egg farmer.

It is high time that facts should be presented, that the strange apparitions of the past season may fade away into thin air.

First, let us analyze the matter of

Ten dollars per bird can be saved by purchasing in July and August.

Summer Feeding Pays

THERE'S good money in producing eggs in quantities at any time. There's better money in producing them when most flocks are falling off in eggs. Don't let your hens run down. Have eggs when eggs are scarce and high. Right now it is important that hens get sufficient protein.

They need lots of it for eggs and for the coming moult, because whites of eggs and feathers are almost all protein. If hens don't get enough protein, they draw it from their body-tissues till they "run down." Then they quit laying, and it takes twice the feed and time to get them back.

Keep Purina on the Job

Feed Purina Chows. They are rich in egg-making, body-building protein. They will get you more eggs now and will help to bring your hens through the moult. Keep your hens laying longer by getting a later and shorter moult. Get them in good condition for winter laying. Have pullets that lay the first winter. You will get back, many times over, the money invested in Purina Chows.

Results Guaranteed or Money Back

The nearest Purina dealer is prepared to hand you a *money-back guarantee* that Purina Chows will get you *more eggs*. See him, or write—

egg consumption. Professor Mussehl sent to the poultry press under date of April 28, some statistics compiled by H. L. McCoy, secretary of an association of poultry and egg buyers in Nebraska, showing that the consumption of eggs from Jan. 1 to April 15, 1921, was 26,000,000 dozens less than for the corresponding period of 1920. Buyers were never so supported and justified in buying the spring flow of farm eggs at low prices, as the widespread publication of that report supported and justified them.

What are the facts when the figures are carried down to June 10, when the farm flow of eggs for storage was practically over? We find the following:

On hand, Jan. 1, 19201,351,000
Receipts from Jan. 1 to June 10, 1920, in four principal markets of New York, Boston, Chicago and Philadelphia7,351,817
Total supply8,893,817

In cold storage, June 10, 1920.....2,665,565
Apparent consumption, 1920.....6,228,252

On hand, Jan. 1, 1921..... 409,000
Receipts from Jan. 1 to June 10, 1921, in four principal markets of New York, Boston, Chicago and Philadelphia8,707,661

Total supply9,116,661
In cold storage, June 10, 1921.....3,241,475

Apparent consumption in 1921.....5,875,186

It thus appears that apparent consumption in 1921 was about 353,000 cases less than in 1920, not 868,000 cases less than in 1920, as was shown by Mr. McCoy's figures which were compiled at the time of heaviest receipts. Moreover, it is doubtful if 1920 is a comparable year, and whether the figures for 1920 should be used at all. It was a most unusual year. The spring of 1920 was late and cold; and because of the switchmen's strike and a shortage of egg-case nails, it was difficult to get eggs to the terminal markets.

Everyone in the trade knows that if it had not been for the open winter and the early season of 1921, the eggs stored in 1920 would not have been sufficient to have supplied the country, and Feb. 1, 1921, would have seen an actual egg famine. Conditions were different this year.

Farm eggs in quantities began to come into market early. Receipts during March and April, 1921, were much heavier than they were for the corresponding period of 1920. Some practical poultrymen maintained that because the farm flow of eggs started early, the hens would set early, and the supply would dry up correspondingly early.

A buyer on the "street," interested in buying cheap as a matter of good business, had a different viewpoint. When interviewed, he remarked:

"The college professors tell us that a hen that was a 48-egg hen last year may be a 60-egg hen this year, as a result of the favorable weather and the liberal feeding of cheap grains on the farms." This argument was repeated among the buyers, who know little of hens, and who deal in the probabilities of the future. They would be more than human if plausible argument in favor of a heavy flow did not influence them in setting low prices at a time when eggs were

THE **MUL-TI-DEK** SECTIONAL **IDEA**

Add a Section as You Need It

The Result of The Poultry Raisers Demand

The Kind of "Mammoth" the Majority of Poultry Raisers Want

The tremendous response from poultry raisers who read my page advertisement in the poultry papers last month, in which I told them about the MUL-TI-DEK Baby Mammoth Sectional Incubator is conclusive proof that the MUL-TI-DEK is just what the majority of poultry raisers want.

With a MUL-TI-DEK you don't have to spend a lot of money for a big expensive Mammoth Machine. You can start with one 250-egg section and add extra sections as your business grows. That's why

It's A Big Winner

Beginning with one 250-egg section you can add extra sections up to 2,000 egg capacity—all heated with one heater—my famous Sol-Hot. These sections can be operated all at one time, or one or more sections can be operated independently of the others. In fact, I have designed and built this splendid machine to exactly meet the requirements of the average poultry raiser. My business of manufacturing the famous Sol-Hot Heaters for incubator and brooders, has brought me in close touch with the poultry raiser—his needs—his desires, etc. That's why I developed the MUL-TI-DEK to meet his demands.

The correct principles of construction and the efficient Sol-Hot Heater which insures even temperature under all changing weather conditions have made the MUL-TI-DEK immensely popular and put it in a class by itself.

Write for FREE Mul-ti-Dek Catalog Folder

Fill out and mail coupon and we will send you free and postpaid, big illustrated folder, telling all about this wonderful and practical Baby Mammoth Incubator. We will send you free plans showing how you can build your MUL-TI-DEK sections yourself, or we furnish it complete with simple instructions showing how to put it together. Write today.

I also take pleasure in announcing to owners of Mammoth Incubators heated with coal burning boilers, that I can now supply Sol-Hot heaters for these machines. Write me telling the kind of machine you have and I'll give you complete particulars.

Most popular hover on the market. Ask your dealer—if he can't supply you we ship direct from factory. Write for free book on Poultry Raising. Reliable Incubator & Brooder Co., Box A-1, Quincy, Ill.

rolling into the four big markets at the rate of forty million eggs a day and they were asked to buy those eggs and store them against the needs of the coming winter.

That was the time for "professors," and other agencies that represent the producers of eggs, to have steadied the ship, remembering:

"He that observeth the wind shall not sow;

And he that regardeth the clouds shall not reap."

The prophesy of a very heavy egg flow because of favorable weather conditions was a fatal effort to read the future. Receipts of eggs at the four principal markets of New York, Boston, Philadelphia and Chicago, as early as the week ending May 14, were 11,500 cases less than for the corresponding week of 1920, as reported in A. P. J. last month under the heading: "Not as Bad as It Seemed." Coming down to date, we find that for the week ending June 4, 1921, receipts were 365,000 cases against 406,000 cases for the corresponding week of 1920. Receipts for the week ending June 11, 1921, were nearly 30,000 cases less than for the corresponding week of 1920. For the week ending June 18, receipts of eggs at the four principal markets of New York, Boston, Philadelphia and Chicago, were 102,000 cases less than for the corresponding week of 1920—a drop of more than three million dozen! The "professors" were wrong. The farm egg flow did begin to let up earlier than in 1920.

Now a word about total receipts this year. The receipts in the four big markets from Jan. 1 to June 11, 1921, were 8,707,661 cases of eggs. The receipts in the same period of 1920 were 7,351,817. It should be emphasized, however, that the market was actually threatened with a shortage of eggs in 1920. Not only was the spring late, but it was a most abnormal year for shipping. When the receipts of 8,707,661 cases in 1921 are compared with receipts of 8,830,505 cases in the corresponding period of 1919, the comparison is more in line with normal conditions.

No economist would think of taking an abnormal year like 1920, and using it as a base for comparisons. He would secure his base by striking an average of not less than five years.

Yet, in the one speculative season of the poultrymen's year, those who represented the interests of producers, accepted false economics, made bad prophecies on probable production, and gave circulation to the figures of buyers, whose very business is the buying of eggs.

Younger men in the industry look to the veterans for leadership, for what to expect, and it is natural that they should be amazed and astonished when men whose profession is poultry should have displayed so little faith and courage, so little knowledge and business judgment.

Cheer up. Be a man. Never again, like the German general staff, may those whose business it is to represent the producers, be too material in their calculations, overlooking fundamental laws that are working while they sleep.

Let us be optimistic. Eggs in storage on June 11, 1921, at the four prin-

cipal markets, were 3,241,475 cases compared to 3,400,938 cases in storage on the corresponding day of 1919. Nothing out of line about that!

Purebred Poultry Are Best.

The great influence of the Madison Square Garden, New York Show, is definitely committed to the interests of the purebred breeder. The secretary of the Garden Show, D. Lincoln Orr, writes: "The present management will never yield to any organization or body of men who do not stand for the very highest in Standardbred poultry."

This means that unsightliness, crudeness and coarseness are not to be substituted for elegance, symmetry and beauty in the exhibition classes at the New York Show. But, it does not mean that the Madison Square Garden poultry show is to become an annual exhibition of mere "fancy" chickens. Just why anyone should have arrived at the erroneous conclusion that a beautiful chicken may not also be a useful chicken, is a mystery. A beautiful plumage is not a symbol of weakness or inefficiency. Does the fact that the robin is red breasted prevent it from seeking out and eating worms, white grubs and weed seeds, the same as the plainest sparrow, and thus working for and with mankind?

Some distinctiveness of type and elegance of form is necessary in our breeds to set them apart and lift them above the commonplace. The breeders of these fowls are not interested alone in the beautiful modeling of their fowls, in "spires and domes." The practicability and utility of the living structures are considered, and designs drawn that make full provision for both symmetry of proportion and utility of the organism. That is the true basis of the existing standards for the practical breeds of domestic fowls.

Some there are to still repeat that beauty is secured at the expense of utilitarian worth. It is tiresome to again hear the old threadbare fallacy, but still it lingers in the minds of some men and influences them. They sometimes point to the race horse and say: "What if thoroughbreds were bred for points other than speed?" Forgetting all the while that the day has passed when the race was won at the county fair by the long-legged, raw-boned, sharp-hipped horse—by the unsuspected "dark" horse. Today the winning horse is a symmetrical animal, beautifully proportioned, sleek, well cared for, and handled by a skilled driver.

Men who race horses, a purely commercial business, in which one factor, speed, is the only desired end, have advanced in their breeding and exhibitions of speed to the point where all their thoroughbreds are harmoniously proportioned, and races are won by beautiful, high bred, well trained horses. No one would today put his money on an awkward nag.

Again, some one says: "But I am not interested in fancy chickens. I want eggs."

A professor of poultry husbandry in an eastern agricultural college once remarked: "People come here who say that they are interested only in

The Wishbone is the money-making Mammoth!

After all, you buy an incubator to make money for you. The one that makes the most is the best—the one you should buy. When you purchase a mammoth bear this in mind—YOU ARE BUYING IT TO MAKE MONEY WITH.

On this basis, we offer the Wishbone Mammoth as the biggest money-maker on the market. It hatches the greatest percentage of LIVABLE chicks with the LEAST COST, in the LEAST SPACE, and with the LEAST LABOR. And the chicks are fine, sturdy, healthy youngsters.

Do not compare the Wishbone with any other Mammoth. It is the time-tried, sure, long-tested standard machine, perfected by the man who made the modern mammoth possible. It has all the good features of any worth-while mammoth plus many new ones. It is the last word, the final development in mammoth incubators. Buy it on our guarantee that it will make more money for you than any other mammoth you could buy.

More Capacity in Less Space

Eliminates all handling of eggs

Costs less to buy

Costs less to run

Hatches livable chicks

Easy to clean

Don't Be Mislead

By the Reckless Claims of Some Manufacturers of Freak Incubators

We have yet to find one case where we cannot put more capacity in any space, no matter how short or narrow, than any other machine on the market. This has been proven time and time again. Send us the dimension of your space and we will prove it to you. Today—write for prices and complete information.

Built in 1, 2 and 3 decks.
Capacity 2,400 to 50,000 eggs.

Prices Guaranteed

Wishbone prices are unconditionally guaranteed against increase or decrease until the 1922 season. If you order now and prices go higher you do not pay any increase. If you order now and prices go lower you will be rebated the difference between the present price and the price in effect when your incubator is shipped. You can therefore order your Wishbone Mammoth now with the knowledge that you are fully protected. You have nothing to lose and everything to gain.

New Brunswick, N. J.

So Easy to Use

ALL successful poultry raisers know that next to a proper supply of feed and water the most important thing in poultry raising is to keep the houses clean, and the birds free from lice and mites. *It is always important but especially so in hot weather.* Sickness or disease usually starts in unclean quarters and in such quarters lice and mites are always more plentiful. Thousands of poultrymen do their whitewashing and disinfecting in one operation by using

The Disinfectant That Dries White

Carbola is a white paint in powder form combined with a disinfectant many times stronger than pure carbolic acid. It is harmless to the smallest chick, and is ready to use the minute it is mixed with water—no waiting or straining. It can be applied with a brush or a spray pump—it will not clog the sprayer—and does not blister, flake or peel off. One gallon—a pound of the powder—covers 100 square feet. It does not spoil, even after it is mixed, and has no disagreeable odor.

As a Louse Powder

Carbola gives most satisfactory results and costs about one-third as much as the other brands. It should be used just the same as any other louse powder is used. Dust it well into the feathers, working the powder in with the fingers, especially under the wings and around the vent to make sure it reaches the skin.

Give Carbola a trial instead of whitewash and disinfectants in your poultry houses, cow barn, stable, cellar, warehouse or outbuilding. It will save you time and labor, will turn a disagreeable job into pleasant, agreeable work—make it easier to do work that must be done. Get some today and have it on hand when you want it. Money back if not satisfied.

Your Hardware, Feed, Drug or Paint Dealer has Carbola or can get it. If not, order direct

A guide to success in this, the most difficult poultry problem

Know How to Turn Loss Into Profit

The results of many years of practical experience and study. Written by Prince T. Woods, a man who knows how and who can teach others. This book will save many dollars for any poultryman and is indispensable to the beginner.

Read These Chapter Titles Over

Chapter I—Selecting and Mating Breeding Stock. Chapter II—Food, Vegetable, Animal and Mineral. Chapter III—Fowls and Food. Chapter IV—Care and Management of Breeders. Chapter V—Eggs for Hatching. Chapter VI—Incubation, Natural and Artificial. Chapter VII—Brooding with Hens and with Brooders. Chapter VIII—Chick Foods and Feeding Chicks. Chapter IX—Growing Chicks. Chapter X—Facts About White Diarrhea. What white diarrhea is. Symptoms of disease. Causes. Is there more than one form? Has germ of specific disease been found? Infection. Prevention. Treatment. Formula for a simple remedy which has proved effective in many cases in many climates for years.

Don't go through years of costly and discouraging experiments to learn the facts taught in this book. One chick saved will pay for it. Learn how to feed; to prevent disease; to make your own brooders, and feed for your chicks. 75c postpaid.

American Poultry Journal, 523 Plymouth Court, Chicago, Ill.

utility, and then go out to the college poultry plant and pick out the most beautiful pen on the grounds." That is not strange. Primitive man does as much; he selects for breeding the best sized, finest shaped, most pleasing colored animals.

The modern purebred breeder, educated, experienced in breeding, critical in his selections, goes deeper. He has learned to appreciate the finer points, the softer tones of color, the detailed arrangements of feather markings, the smooth lines of body conformation.

Too long, however, has he hesitated to proclaim the beauty of his birds, as if beauty were something about which he should be timid. Fact is, beauty is an important and legitimate factor in the popularity of Standard-bred fowls. Remove it, and you take away the charm, the incentive, the fascination.

In this day when we hear so much about the economics of poultry raising, and the world seems to be full of credits and debits, it is the refreshing beauty in the life of every poultry fancier that holds him to his task. There is always pleasure and satisfaction in his Standardbred birds, which he loves; in his garden, his flowers, the sunrise, and the twilight in the evening when the young birds sit nestled on the roost. Nature is good to him.

The home surroundings of fanciers in the future, as in the past, will be distinguished by flowers, and mowed lawns; and the seed corn in the gardens will be planted in straight rows, although from a strictly utilitarian standpoint more seed could be planted in a crooked row. And the fancier's beautiful hens, which he watches and studies, and cares for with an interest that only a lover of nature understands, those hens will lay, just as the carefully selected seed corn in the straight rows in his garden will bear roasting ears.

Five-Toed Fowls.

A reader of the Journal writes that he has a hen with four toes and five toenails, that he has been breeding her for several years and most of the chickens she produces have five toes on each foot, but sometimes a chick has five toes on one leg and four on the other.

Five-toed fowls are more extensively bred in England than in the United States. The old English Dorking is probably the original five-toed fowl. The Houdan, which carries Dorking blood, also the Faverolles, the famous French breed which derives much of its quality from the Dorking, carry five toes.

In a high-class exhibition bird, the extra digit should be detached from the hind toe and curve upward. It should not touch the earth and be used for walking or perching. When the extra toe is not well formed it may curve downwards or be merely an extra toenail on the hind toe.

The fifth toe is not a new character. Columella, a Roman Agricultural writer, who lived at the dawn of the Christian era, referred to fowls with five toes, and Pliny, a Roman of the first century, writes of fowls with "an odd number of toes."

C. T. DRYZ, Box 1032, EAGLE RIVER, WIS.

The character existed in the old Roman fowls which were the ancestors of the old English Dorking. Strange as it may seem, the Silkie, bred and developed in far off Japan, also has five toes.

The antiquity of this five-toed character removes the fowls so possessed from a class composed of mere oddities. The five-toed Dorking is, in reality, an excellent breed of poultry. The fine flesh of this old English breed has given it a reputation as "a bred to be eaten fowl" and many buyers of poultry in the London, England, market stalls pick their bird by the toes on its feet, preferring a five-toed chicken.

The Dorking is said to be a delicate chicken to grow. The fact is that chicks of this breed gain in weight as fast as any Plymouth Rock or Wyandotte; and at the same time, they feather as fast as a Leghorn, and grow a larger feather. This rap-

Ideal foot of a five-toed fowl. The fifth toe is separate from the hind toe and inclines upward.

id growth of bone, flesh and feathers makes a heavy demand on their organism and careless or inconsiderate poultry keepers cannot handle these chicks successfully. Here and there, however, are to be found breeders who understand and appreciate this grand old breed. One of these, Mrs. Omer N. Taylor, of Kansas, recently wrote us:

I wanted to let you know that I read your reference in the editorial in the May Journal on Silver Gray Dorkings. It certainly sounds good to read something like that as so many kick against their fifth toe, but I have had them for two years now, and they lay better than any breed I ever handled; so same, too.

I have cockerels, and pullets weighing two and a quarter pounds at two months and one cockerel is celebrating by crowing. He seems to have been practicing for some time. I certainly do not agree with the article by Mr. Garner that small chickens are best for back yard poultry keepers. Many thanks.

The five toed character is usually dominant to the common four toed condition. That is, when a five toed bird is crossed on a four toed fowl, nearly all of the chicks have five toes. The extra toe, however, is seldom well formed, and after crossing it takes considerable careful breeding to produce birds with the fifth toe distinctly separate from the fourth and curving upwards.

Breeders of four toed fowls do not give as much attention to toes as do Dorking and Houdan breeders. An ill shaped fourth or fifth toe practically spoils a Dorking or Houdan for the best shows.

Four toed fowls may also have poorly formed toes. This is especially true of the hind toe. Instead of projecting backwards, it may join the shank rather high, drop down on the

inside of the shank, and be carried slightly forward. This defect is known as "duck-foot," and is a mean fault in occasional otherwise good birds. Sometimes a hen with a duck-foot transmits the fault with some regularity and persistency to her cockerels.

Production Classes.

A great many of the poultry shows in England have a "fancy section" and a "utility section". The Committee of Forty has recommended for all American shows, "production classes" in addition to the present hen and pullet classes. The committee has further recommended that these production classes shall be judged by physical appearances, and that a standard for this judging shall be drawn up and incorporated in the Standard of Perfection.

Is it not confusing to speak of two different kinds of judging?

Our definition of judging would be the selection of birds for breed size and breed type, and for the points of color and markings that distinguish the several varieties of the different breeds.

Judging by "physical appearances," such as condition, late molting, faded shanks, beak and eye ring—such judging impresses us as culling.

It is proper to cull for productivity, but it is necessary to judge for breed character. Standard fowls in the shows should be judged by the Standard; flocks should be culled in late summer by all outward signs which serve to indicate which hens have dried up, that they may be separated from hens that are continuous or heavy layers. There is the difference, and Standard makers should not confuse culling and judging.

We believe that the majority of breeders feel that in future, as in the past, the Standard should authoritatively set forth, in text and pictures, those ideals that best urge upon the minds of new breeders the fundamentals of breed type and breed character; and that late molting and faded shanks should remain symptoms of productivity to be applied in culling practice. This idea is well set forth in the following letter from Homer T. Richardson of Texas:

"The Standard is really the sine qua non of the purebred breeder. Without it to set an ideal (no matter if an imperfect one) we would in time have as many variations of each breed as there are ideas among breeders, with the result that all uniformity would be lost. That is as plain as the nose on one's face. Well, now, is there any reason for the Standard's existence other than this setting of ideals? Obviously not. That being the case why increase the scope of the Standard at all?"

"Of course, chickens produce meat and eggs, they molt, and will have lice and mites if not properly cared for, but none of these things have to do with making a breed uniform, and a perfect knowledge of these subjects will not help me one bit in breeding my Anconas so they will not have Leghorn type, or will it tell me what the feathering or head points should be in my ideal. I purchase the Standard to give me that information, to set forth the ideal type, size and color of my breed.

"There is not in the proposed chapter on production a single proposed addition to the Standard that does not properly fall within the field of the poultry journals, agricultural colleges and writers of practical poultry books. Let us keep the Standard in its place as a clear concise Standard, that all breeders may have a uniform gauge to go by. Revise its text and illustrations where needed, but keep the Standard in its proper sphere as a law on breed types, not a book on culling."

Big Standard Revision Meeting Will Be Held in 1922.

If the report of the Committee of Forty is adopted at the Seattle Convention, then that part of the report referring to Standard revision will be put in the hands of the Standard Revision Committee.

The Standard Committee will then make its own independent recommendations, in detail, at the annual meeting of the American Poultry Association to be held in August, 1922. At that 1922 meeting, when the recommendations of the Standard Revision Committee will be presented in detail, the members and breeders in the convention will have an opportunity to correct, amend, reject, and finally settle all questions pertaining to the 1923 Standard.

CURRENT NOTES AND COMMENT

Wyandottes Make Good Showing.

The Leghorn has the reputation of being the more economical consumer of feed, but during April the Wyandottes held first place for small feed consumption of the Storrs, Conn., egg laying contest.

The table below shows the total number of birds in each of the four principal breeds that are entered in the contest, the average amount of grain and mash consumed by each pen and the average number of eggs laid by each pen of ten birds; month of April.

	Mash	Grain	Eggs
Plymouth Rocks	43.0	39.5	194
50 Wyandottes	37.7	38.3	197
270 Rhode Island Reds	45.6	39.7	204
500 Leghorns	41.1	40.8	209
40 Miscellaneous	38.8	37.0	169
1000 Ave. All Breed	42.1	40.0	203

At this season of the year egg production is lower than in April. The problem now is not to prevent a falling off in egg production but to see that the decline is not more marked than it ought to be.

* * *

Washington, D. C. Show.

D. Lincoln Orr is to manage the Washington, D. C., poultry show, and the dates of Nov. 22 to 26, 1921, have been set for the forthcoming exhibition.

* * *

Wonderful Fecundity.

Prof. Rice and the Pacific Coast poultrymen are doing the best they can, in the interests of American producers, to picture China, not as a nation, but as an incomprehensibly huge and fecund bird—a nest loving hen, with nothing on her mind except the duty and desire to lay eggs.

Imports from China of dried and frozen eggs, during January, February, March and April, amounted to 3,107,859 pounds. Imports of eggs in shells from China during same period, 1,123,000 dozens.

* * *

To Teach Culling Methods.

A poultry judging school will be held at Cornell University, Ithaca, N. Y., July 4, to 9, 1921. Men prominent in poultry educational work, who have been especially active in their study and application of the characters which indicate egg production, will give the instruction. For announcement of this school, address the poultry department, Cornell University, Ithaca, N. Y.

* * *

Feeding Value of White Corn.

Breeders of exhibition poultry of the white varieties have long insisted on feeding white corn to young stock and fowls in molt, to eliminate as far as possible all tendency to sappiness or creaminess in the plumage. They have never reported any disadvantage in its use, although there is a pronounced opinion held by some people that white corn is not the equal of yellow corn in nutritive food value.

A recent report by Dr. H. H. Mitchell, University of Illinois, stated that yellow corn contains considerable amounts of the "fat-soluble" a vitamin, found so abundantly in butter, while white corn is practically devoid of this element. However, in feeding experiments, Dr. Mitchell has found that litters from white corn fed sows are in every way normal and have grown at the same rate as litters from yellow corn sows.

* * *

Co-operative Marketing.

Reports the past season have indicated advantages of co-operative selling in large terminal markets. Three cases of eggs recently shipped to Boston by a county agent in Minnesota brought 32 and 30 cents a dozen, from which express charges of 7 cents should be deducted. Local buyers were paying 18 cents. It should not be overlooked, however, that the county agent carefully graded the eggs that went east, whereas the local buyers paid 18 cents for general run.

Another year markets should be better stabilized. Conflicting reports on conditions made the 1921 markets speculative and hazardous for big buyers. Another year the

Basic Feeds

The Best and the Cheapest

From F. S. Cleworth, breeder of S. C. Black Orpingtons, Olds, Ia., dated June 7, 1921:

"Enclosed find check — — for the following feeds — —. Please ship — —. Your feeds are the best and most moderately priced of any that I buy."

His Birds Thrive on Basic Feeds

From Andrews & Bradford, Spirit Lake, Iowa, breeders of S. C. W. Leghorns, dated June 18, 1921:

"You may ship — —. We are very much pleased with the feeds we have purchased from you in the past. They are always fresh and sweet, and our birds have thrived on them."

Built BUCKEY

THE Buckeye Mammoth modern business hatchery designed upon new principles of the Buckeye Mammoth.

Compactness and ease of installation require a floor space of only 8 feet 6 inches.

Only five minutes a day are required to increase revenue from the hatchery.

BUCKEY MAMMOTH INCUBATOR No. 7

Capacity—10,368 eggs held in 108 turning trays. This capacity does not include the 36 hatching trays.

Size—Eight feet, six inches square; height, seven feet, three inches.

Weight—6,800 pounds, crated.

Case—Selected California redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½ inch cast iron pipe.

Egg Trays—108 turning trays with a capacity of 96 eggs each, and 36 additional hatching trays. All trays equipped with convenient card holders, which make record keeping easy.

Electric Fans—Four ball-bearing fans, specially constructed for incubator service.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers—Two certified thermometers, specially constructed for Buckeye Mammoth Incubators.

Thermostat—Five-inch, double disc thermostat, of the wafer type, which is specially constructed to provide the highest efficiency in temperature control. Solid brass hardware used on Buckeye Incubators exclusively.

BUCKEY MAMMOTH INCUBATOR No. 8

Capacity—4,600 eggs.

Size—Five by eight feet; height, five and a half feet.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1½ inch cast iron pipe.

Egg Trays—48 turning trays with a capacity of 96 eggs each, and 16 additional hatching trays. All trays equipped with convenient card holders, which make record keeping easy.

Electric Fans—Two ball-bearing fans.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers—As in No. 7.

Thermostat—As in No. 7.

BUCKEY MAMMOTH INCUBATOR No. 6

Capacity—2,440 eggs.

Size—Five feet square, 32 inches deep. Legs eighteen inches high.

Weight—850 pounds, crated.

Case—Selected California Redwood, cabinet finish.

Boiler—14-ounce cold-rolled copper.

Radiator—1-inch cast iron pipe.

Egg Trays—Twenty egg trays, with a capacity of 122 eggs each. One extra tray for egg turning.

Electric Fans—Two 9-inch ball-bearing fans.

Heater—Blue-Flame gas or oil heater, as requested.

Thermometers—Two specially constructed thermometers.

NO COOLING REQUIRED

Under this Buckeye system of incubation, the eggs require no cooling whatever. Other hatcheries require that the eggs be taken out and cooled at least once a day, but in the Buckeye Mammoth system, the fans automatically supply that fresh air and save all that labor.

Specially built 16-inch ball-bearing electric fans in these incubators circulate warm, fresh air, and an especially sensitive thermostat insures the correct temperature every minute of the day. The constant circulation of revitalized air is largely responsible for the size and vigor of the chicks.

The Buckeye Hot Water System is used in the Buckeye Mammoth, the heat being furnished by gas or gas stoves which are absolutely odorless and extremely economical.

Buckeye Mammoth Incubators are built in three sizes: No. 7, 10,368 eggs; No. 8, 4,600 eggs; No. 6, 2,440 eggs.

Our new catalog tells all about these wonderful modernized incubators. Only a limited quantity can be supplied. Write for this catalog, study the Buckeye Mammoth, and order yours before the season closes.

Baby Chick Convention.

The annual convention of the International Baby Chick Association will be held in Philadelphia, August 3, 4, 5th. The headquarters will be at the Hotel Adelphia. The convention will be enlivened by entertainments of various kinds which will include trips to historic points in and about Philadelphia, the theatres; and a trip to Willow Grove Park, one of the largest and most beautiful pleasure parks in America.

Automobiles will take the visitors, on Field Day, from the hotel, out through Fairmount Park, to the well-known Experiment Farm of the Pratt Food Company near the village of Morton in Delaware County, Pa. A novel program has been arranged by M. C. Kilpatrick who is in charge of this plant.

On Saturday, the 6th, an excursion is planned to Vineland, N. J., well known as one of the greatest poultry and egg producing sections in the United States. The Vineland egg laying contest will be a special object of interest.

Among the matters which will occupy a leading position on the program are questions of the standardization of labels, a standard of values for chicks, postal and shipping regulations, investigations in incubation, and breeding stock. The convention will be limited to members, and any baby chick raiser, breeder or interested manufacturer, is eligible to membership. Fred H. Thayer, Secy., 208 N. Eutaw St., Baltimore, Md.

* * *

Producing More Cockerels Than Pullets.

It has been said that if an old cock is mated to strong vigorous pullets, the offspring will be largely cockerels; and if a strong, virile cockerel is mated to a limited number of two and three year old hens, pullets will predominate. This is an old theory on the control of sex, the belief being that the male influences the get of cockerels; and if the male is the stronger he will have the greater influence on the offspring and pullets will predominate. In other words, the weaker sex seems to have the greater opportunity to reproduce itself.

* * *

Telling Cockerels from Pullets in Baby Chicks.

Thirty years ago, Joseph McKeen, originator of the Golden Wyandotte, crossed a Silver Wyandotte male on red females and all the chicks were silver colored. When a red male was crossed on Silver Wyandotte females, the cockerels came silver and the pullets golden. In other words, pullets took after their sire and cockerels took after their dam.

The experience went unheeded, but the peculiar law that operates has recently been unearthed by Prof. Punnett of England. He has suggested that if baby chick hatchers would make first crosses of golden males on silver females, they would be able to distinguish with great ease the silver cockerels from the golden pullets at hatching time.

It has been observed that in the majority of pure breeds the cockerels hatch lighter in color of down than the pullets. There is no sure and simple method, however, by which sex in purebred, not cross bred, day old chicks may be distinguished.

* * *

In Recognition of Long Service, Faithfully Rendered.

Early in June, Thos. F. Rigg, president-elect of the American Poultry Association, made a trip from his home in Iowa to the office of the secretary of the Association in Fort Wayne, Indiana. Upon his return he prepared the following statement:

"Recently I spent several days going over the books and records of Secretary Campbell in her office at Fort Wayne, Indiana. I expected to find these records complete and the affairs of the Association well guarded. I am more than glad to be able to say to the members of the American Poultry Association that Mrs. Campbell is giving the Association very valuable service, a service which is appreciated by comparatively few members of the Association, who are, by

THE BROWN FENCE & WIRE CO., Dept. 13 CLEVELAND, O.

reason of the nature of the methods employed and directed by the Constitution, privileged to come into close contact with the work of the secretary.

"The members meet once a year and in their enthusiasm resolve to do many things for the benefit and for the furtherance of the good of the association. Then they go home and forget about the good resolutions. And it falls upon the secretary to go to her office, there to labor to keep the affairs of the association in running order, to secure new members and to 'get the money' to pay the bills. We as members have not given the secretary the support and aid to which she is entitled. Let us do so from now on. I know the secretary wants this support and aid, and it is our duty to give it to her."

It is a pleasure to read these words of commendation on the work of that efficient and loyal officer of the A. P. A., Mrs. E. B. Campbell. Her husband was secretary during the years that the Association grew from a membership of 1241 to a membership of 8661, and upon his death, Mrs. Campbell, who had been in close touch with the details of the secretary's office, was appointed to fill out his incompleting term of office; and she has since been reelected annually to this position.

* * *

Bagging Down Behind.

This condition, sometimes referred to as "water bag" is known as abdominal dropsy or chronic peritonitis. Frequently the condition is not curable being due to an injury, which results in a perforation of the intestines, and permits fecal matter to enter the body cavity. Broken-down hens should be culled out and sold as market poultry.

Some hens go on the nest but do not lay. In this case the eggs may be absorbed by the body or may lodge and accumulate in the abdomen. Those hens that bag down behind and have a hard abdomen, are often found to have a body cavity full of hard, partly absorbed yolks. Cull out such hens.

* * *

\$63,000 for Poultry.

The omnibus bill before the State Legislature of Illinois includes an appropriation of \$63,000 for poultry work. Farmers, who pay a large part of the taxes, may feel that a small fortune is a good deal to give to the hen industry. Fact is, Illinois has a hen population of twenty million, and thirty million chickens a year are grown on the farms of the state. If, as a result of educational poultry work, one more egg per hen could be produced, and one more ounce of weight per chicken could be realized, it would mean, in terms of dollars, one million a year to the farmers of the state.

Congress authorizes a new battleship of the super dreadnought class. The hull and machinery will cost twenty-one million, the armor and armament, fifteen million, and the equipment and ammunition, four million. The useful life of that boat will be as long as the span of existence that nature allots to a horse. The same appropriation of forty millions for a floating armada would pay for 631 years of poultry work in the state of Illinois at the rate of \$63,000 a year.

All wealth comes from hens, the backs of sheep, the meat and products of animals, and from grain bearing plants. Without domestic animals and useful plants there might be wandering tribes of huntsmen and fishermen, but there would be no civilization, no accumulated wealth. Agriculture stands first in its relation to mankind. Someday it will stand first with all those who legislate for the betterment of mankind.

Want Capons in the Standard.

George Beuoy is making a strong effort to get capons recognized in the Standard, so that classes will be provided for them in the Shows, the same as classes are now provided for steers in fat stock exhibitions and for geldings in horse shows.

Mr. Beuoy recommends adding to the "Instructions to Judges" the following: "In Judging Capons, the Standard should be applied in each breed the same as it is to other males, except comb and wattles which should be very small and undeveloped as compared with other males of like age and breed."

To apply the present Standard to capons, and judge them by the same scale of points which were drawn up for the judging of cocks and cokerels, would result in only 4 points out of 100 being allotted to the weight of the capon. Forty points out of 100 would come nearer to expressing the importance of size in a capon. Forty more points should be given to the distribution of weight and quality of skin.

Capons are the fat steers of poultrydom.

HALL

Buy an Incubator on Performance —not Promise

That's the one right way to buy an incubator—not on promises of what it may do, but on the record of what it actually has done over a long period of years in the hands of thousands of owners.

The twenty-five-year performance record of HALL EQUIPMENT stands out as a safe guide post to the incubator and brooder buyer.

They have as legitimate a place in the poultry shows as prime beef steers have in a fat stock show. But, do not attempt to score them. Who ever saw a Black Langshan capon have the proper carriage of tail? And of what importance is carriage of tail in a capon? Absolutely none. It is an important thing in a breeding bird, but when a male is unsexed the important things are not breeding values, but size as measured on the scales and the distribution of the meat.

Judging capons by a true market poultry ideal would have a beneficial effect on breeders, for it would emphasize the importance of meat on the breast rather than on the drumstick, and would serve to make plain the types in which there is less bone and offal in proportion to the edible meat.

* * *

A New Feeding Stunt.

Fleischmann's yeast has been widely advertised as a food. We noticed the other day in a restaurant a supply of it for folks who wanted to eat bread and yeast instead of bread and cheese. Now comes the announcement that yeast may be fed to rabbits for the attainment of size, fur and perfect condition. It is reported that many of the first prizes at the Annual National Show of California Rabbit Breeders Association held in the Oakland Auditorium, January 6-9, 1921, went to those breeders who fed yeast to their stock from babyhood. The beautiful silky sheen of the fur, which is a characteristic of rabbits raised on yeast, frequently decided the contests. Several yeast-fed rabbits took prizes for weight."

The feeding of yeast would add materially to the cost of growing chicks, but some enterprising fancier may try it on a few birds.

* * *

Black Giant Club Organized.

A meeting of breeders of Jersey Black Giants was recently held at Cranbury, N. J., for the purpose of organizing a club to promote and protect the interest of its members. Many Black Giants are bred and raised annually in New Jersey for the production of "Philadelphia Capons," and interest in this great market fowl is of considerable local importance. M. L. Chapman was elected secretary-treasurer.

Color of Beautiful Variety.

(Continued from page 712)

is a result of combinations of black and white in different degrees.

In my first purchase of White Cochins I was very fortunate as to the quality of the birds I received; however, I was much surprised in having many of the first young chicks show a slatey shade of down, which I soon learned was known as young mouse color. I came to know later that those of this peculiar shade of color matured into birds that had much the better tone of white plumage, not only the web of feather being a blue-white shade of color, but the quill of the feathers as well. It is well known that a few drops of bluing is used in washing both clothes and white chickens in order to secure this particular shade of white, which is much clearer than a yellow white.

This experience with White Cochins further convinced me that any success I might expect to attain in handling the Partridge variety would come in a large measure along the lines of properly handling the shades of black and white in the undercolor; and having in mind nature's provision in furnishing a high surface colored bird with lighter undercolor, I was still more firmly convinced that in our man made Standard we may depart quite a bit from her laws in some ways, in other ways we must cling quite closely.

Those great breeders of Partridge Cochins, now gone over to the other side, William H. Brackett, Philander Williams, Sherman Hartwell, Charles H. Crosby and George H. Bradley, all knew the value and influence of undercolor in bringing about the best results—not intensity of black undercolor, which is merely quantity of pigment, but the proper tone of undercolor, which is quality. And the same may be said of those five judges, I. K. Felch, Henry Bail, B. N. Pierce, Sharp Butterfield and David A. Nichols, all of whom were perfectly familiar with the necessity of undercolor study. With Messrs. Butterfield and Nichols, I have so many times gone over the fine points of our Cochins, as Mr. Butterfield was one of the foremost breeders of the Buff and Partridge, and Mr. Nichols was the leading breeder of Blacks in his day.

I must not fail to mention the late William H. Harrison, Jr., formerly of Toledo, Iowa, probably the last of the great western breeders of the variety in which I am so much interested. I believed him to be the producer of the finest in mahogany color and beauty of penciling of any breeder of Partridge color of later years. On page 27 of January, 1904, A. P. J. appeared a full page illustration of Partridge Cochin feathers taken from Mr. Harrison's birds, and he certainly was an artist in the combination of shades of colors to produce proper penciling.

I knew Mr. Harrison very well and frequently discussed with him the matting of our birds. We were thoroughly agreed as to the handling of all points and especially the study of shades of color in the production of desirable undercolor. If there was ever any difference of opinion it was in the male, Mr. Harrison leaning more to white as the feathers of the hackle and saddle approached the skin, while I held that a undercolor just under the surface that shaded to a lighter shade toward the skin could safely be used, and this policy I have always persued.

I have written quite a sermon, and there is much more that could be said, but what is the use? Mitchell is bound to steer clear of too dark undercolor in breeding birds, with the idea of producing both males and females from the same matings that will comply with the description of the ideal set up for us to attain in exhibition birds.

Capon Making Time.

In season capons are now quoted on market reports like other classes of Poultry. These quotations for the season just closed have run from 40c on the poorest market up to 75c or more on the best ones for live capons per pound. These prices mean that capons on the market have brought from \$5.00 to \$10.00 each, for it is comparatively easy to make a capon weigh 10 lbs., when cockerels of a large meat breed are used. These prices are as good as is usually averaged for breeding birds of fancy quality, with the added advantage that they can be sold in bunches and the proceeds realized in a lump sum, with the minimum of cooping and shipping expense. With feed at the low prices now prevailing and the price of young cockerels relatively low, an unusual opportunity is open to poultry raisers who make capons this season. Cockerels should be caponized before they reach 2 lbs. in weight.

REGAL DORCAS WHITE WYANDOTTES SUMMER SALE ANNOUNCEMENT

For the past eleven years it has been my annual custom to hold a SUMMER SALE of stock. On account of my very heavy egg trade, I am obliged to keep all my breeding pens mated until July 1st. After that time it is absolutely necessary to make room for my rapidly developing young stock. This season I have over 2500 thrifty chicks, hatched between the middle of January and the middle of March and they are constantly needing more room. To give them proper accommodation, I must dispose of a large number of my breeders quickly. This is not the usual time of year to sell stock, it is true, but to make it an object for you to buy at this time, I am quoting very special values. My list this season is, without a doubt, the largest and best that I have ever offered. Many of the birds in this list will win in the large shows next winter, and they have grand breeding with generations of "Regal" ancestry back of them.

FREE—Send for complete list of the 1000 choice breeders offered for sale. 20 page catalog also free.

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.
J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right.
OSCAR THOMPSON,
Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.
JOHN HOLTRAP,
Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective.
HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter.
FRED S. WILLIS,
Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers.
EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried.
MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.
J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed.
MRS. L. M. JOHNSON,
Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.
BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.
L. G. STAYNOS,
Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

MONEY BACK IF IT FAILS.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

Chicken Mites Filled With the Life Blood of Faithful Hens.

AMERICAN SUPPLY CO. Dept. 54 QUINCY, ILLINOIS

Sicilian Buttercups.

(Continued from page 713)

common, indigenous material, but always setting an ideal, and selecting, breeding and mating for the definite purpose of producing a strain that would breed true to that ideal of type and color, size and temperament.

It was for the purpose of promoting an exchange of opinions and developing Standard ideals in common that the American Buttercup Club was organized in March, 1912. A standard was established by common agreement on the points involved at the first meeting of the club, Rochester, January 8, 1913.

Important changes in this standard were made during the New York State Fair in 1914. I well remember how carefully the feather pattern was examined by interested breeders at Syracuse that year. Feathers from many different birds were plucked and compared. What are now agreed upon as the ideal feather markings for Standard Buttercups were first accepted at that time.

The cut which accompanies this article, which is reproduced by courtesy of the American Buttercup Club, shows the correct markings in the different sections of both male and female.

The ground color of the female is rich buff. On this there is a black penciling. It is not a straight across-the-feather penciling, such as is seen in the Golden Penciled Hamburg. The markings do not run across the quill in the center of the feather. In short, the bird is what could be termed

"a weak penciled bird." As one would naturally expect in such a color type, the throat and upper part of the female's breast is plain buff, free from penciling.

Those females that are best marked have, as a rule, white ear-lobes. They are usually trimmer, and not so thick through the body as the female illustrated in the feather chart.

The best males are very much like the male illustrated. They commonly have red ear-lobes, although the color of this section is immaterial in judging by the club standard. The male is equally as attractive as the female. His neck and saddle is a lustrous orange red. Across his wing bar is a darker shade of red. His breast is reddish bay. Tail, lustrous greenish black.

Some black should appear in the fluff of the male. Observe the illustration closely just below the wing flights. Note that the body fluff is marked with distinct black spangles. While the male in general is very differently colored than the female, his value as a breeder of penciling in his pullets depends very much on the spangling he carries in his fluff.

The comb is the most characteristic section of the breed. It has been gratifying, however, to observe that during the past show season, breeders and judges have struck a balance and looked for type, color and markings, for general all-round excellence, and have not been making a fad of the comb section.

The comb, from which the "Buttercup" derives its name, is produced by crossing a single comb on a V-shaped

or leaf-shaped comb such as is carried by the Houdans. The Buttercup comb starts with a single leader which splits and opens out into a cup-shaped crown, which is surmounted on the sides with well defined points.

For a time many birds were disqualified if they had a point in the center of this cup; but the arbitrary and technical disqualifications which handicapped the progress of this breed do not appear in the last revision of the Buttercup standard. A certain desirable elasticity is therefore afforded the breeder of today, and he is removed from the discouragements incident to an uncompromising standard of disqualifications.

Much progress is to be observed in the females. The six-pound Buttercup hens of eight years ago, which had red lobes, stubs on their shanks and double lacing instead of penciling, have been supplanted by a more typically Mediterranean female, which has white lobes, spirited bearing, harder feathering and the modern form of Buttercup penciling.

This variety has willow green shanks, and is quite distinctive in many ways. The breed has been admitted to the Standard and will appear in the 1923 edition.

Great size and form with beautiful feathers in fowls still command admiration, and it is but a question of time when some of the favorite breeds of the past will again be in evidence at our poultry shows. And the Cochins are bound to be one of them, although the English full-feathered brand may never be resurrected in this country. The Partidge Cochins bred to the highest standard of perfection in America, both in type and color, is the true Cochins model in shape, which Buff and White Cochins breeders must pattern after.—American Fancier.

AUGUST

JANUARY

FEBRUARY

APRIL

MAY

"Here," said we to the artist, "illustrate this letter!"

What he gave us looks like a weather forecast:

- August—GETTING "WARM"
(notice the Sheppard Catalog)
- January—CONSIDERABLE COLD
(notice the eggs)
- February—ZERO! B-R-R!
(notice the SNOW on the nest)
- April—WARMING UP
(notice how tame the Anconas are)
- May—JUS' RIGHT
(notice the Catalog opened to the "Famous" Baby Chick Department)

Reads like an almanac, but it's the TRUTH!

—And August is a mighty good month to begin keeping Sheppard's "Famous" Anconas! Have you my catalog?

H. CECIL SHEPPARD

Berea

Box 505

Ohio

The Letter!

Bought twenty-five Ancona chicks from you last August, and will say that they are "wonderful." They started to lay in January. I had a cold hen-house, most of the time covered with snow, and the Anconas would sit on a nest of snow and lay. I have ten pullets and am getting from six to eight eggs a day. They are tame and can be picked up anywhere. Let me hear from you regarding more Baby Chicks.

W. P. M., New York

Twenty Million Chicks a Season.

(Continued from page 708)

and ten-cent stores, and other similar places, have been featuring baby chicks in the spring season, and they will take almost unlimited quantities of them; although they buy on a close margin and do not pay as high a price as private customers.

All of the various hatchery owners get together occasionally and formulate certain general methods of business procedure, with the result that their methods of securing eggs, stock, etc., are very uniform. The prospective customer, therefore, may know from this that even if for some reason his chicks do not come directly from the hatchery ordered, what he receives will be of equal quality. It is almost impossible for so huge an enterprise to be able to dispose of exactly the number of chicks hatched in exactly a certain time. Sometimes the hatches run so large that more chicks are hatched than anticipated. Then if the chicks are left over and sold in turn to another hatchery, which in turn sells them to a customer, no right-thinking person will object, so long as the chicks he receives are first-class and the price is right.

After visiting a number of most interesting hatcheries, Mr. Drumm turned his car towards home, and in a short time we had arrived in the pretty little village of Rosemont, nestled in the lovely hilly country of North Jersey. Some of the points learned from our inspection of the great New Jersey hatching district, follow.

Quantity Hatching.

In hatching on so huge a scale we find that various problems are encountered which are not generally found to such an extent in small hatching operations. With so great a capacity as many of these machines possess, the heat supplied, though remarkably uniform, is not absolute in all sections of the machines. For this reason, the compartment regulation of the big machines is done by means of thermostats, so that in effect each compartment is a complete and independent hatching unit. The delicate adjustment keeps the compartment uniform enough no matter in what part of the machine, so that a satisfactory hatch is obtained.

Heat Control.

While we are on the subject of heat control, it will be interesting to know that Mr. Drumm has found some surprising things in connection with hatching eggs. For instance, if for some reason the eggs have not been receiving a sufficient amount of heat during the first few days, it is possible to counteract this lack by running the temperature a little above normal the same length of time as the eggs were run below normal. If 102 degrees was registered the first five days, and then the temperature raised to 104 for a corresponding period, the effect seems much the same as though 103 had been registered during the ten days. At times the variation is considerable, and by raising or lowering of temperature either above or below normal, the chicks hatch out on time and are apparently as good as any. The actual number of "heat hours per hatch" seems to be of greater importance than if the temperature is kept at exactly 103 throughout the 21-day period. Such extremes as 100 and 106 degrees have been registered and the chicks still have hatched as well and were as strong as any.

A hatch may also be hastened somewhat by raising the temperature slightly throughout the period. But this is not recommended, as the chicks are not so strong, even if the percentage hatched is good. If eggs are placed in the machine stone cold the temperature may be run higher at first than 103 in the compartment until the eggs are sufficiently warm. This helps to hasten the hatch, so that chicks come out in the regular 21 days. Even one day late means money lost in a large hatchery, and so hatches are kept right up to schedule.

It must not be thought from this that anyone running an incubator can with impunity juggle the temperatures and expect a good hatch. The amount of ventilation furnished in these mammoth machines is considerably greater than is generally the case. A hatching egg can stand quite a variation in temperature and hatch well if an abundance of ventilation be supplied. Mr. Drumm firmly believes that the supplying of an abundance of fresh air, far more than is generally given hatching eggs, is one of the secrets of successful hatching, especially on a large scale. There are numerous instances on record of eggs being exposed to the intense rays of the summer sun, and despite 110 degrees registered, or even more, the eggs hatched

Young Stock for Old

Right now is the time to go through your flock and weed out all birds which are not 100% producers. Get rid of them—and in their place get stock that will give you the results that you should have. We not only raise birds that will give you the maximum results—we go a step further and sell them at prices that will permit the man of ordinary means to purchase them.

Parks' Bred-to-Lay and Do-Lay Barred Plymouth Rocks

For 33 years we have been pedigreeing and trap-nesting Parks' Strain of Barred Plymouth Rocks with but this thought in mind—

to permanently satisfy every customer.

That we have attained this aim we have reason to believe, because daily we are receiving letters similar to these:

Mrs. L. S. Hazzard, Elizabeth, N. J., writes in part: * * * "I am sorry I spent any time and money on other strains, but we all have to learn."

Another Remarkable Record. Taft, Fla., May 10, 1921. Chickens hatched from our Pedigreed Pen Bred Eggs January 13th. First pullet layed May 7th, when only 113 days old, next day three layed. They are wonderful fine looking birds too.—W. J. Jensen.

We suggest that you place your order early as our thousands of customers each year anxiously await this sale.

out well. And mainly for the reason, we may feel safe in believing, because an abundance of perfectly fresh air was supplied to the eggs.

Moisture Control.

In connection with hatching successfully on a large scale we find that the proper degree of moisture supplied is also of paramount importance. We were told that the eggs are carefully watched and particular attention given to the development of the air cell as the hatch progresses. If it is found, for instance, that this cell is not developing rapidly enough the moisture supply is lessened, so that the egg receives sufficient air for the embryo chick. On the other hand, if the evaporation is taking place too rapidly, and the air cell shows too great a development in a given time, additional moisture is supplied. The gauging of this moisture control, by watching the air cells in the eggs, comes only with experience, but it can certainly be learned by anyone who makes a study of it and profits by what he learns.

Thus the two main causes for either good or poor hatches on so large a scale are controlled and corrected to a considerable extent by the amount of fresh air and moisture supplied. These various points lead us to believe that the problems of correct temperature, ventilation, and moisture are being more carefully studied and more accurately understood each year.

Hatching Percentages.

The percentage of eggs hatched on so large a scale depends, of course, upon the parent stock as well as the care the eggs receive during the hatch. This spring, due to the unusually advanced season, hatching eggs were more than ordinarily fertile. We saw many compartments of 150-egg capacity hatching around 100 chicks. Practically all of the hatcheries we visited were showing anywhere from 60 to 70 percent hatches for the season, with many individual compartments showing a much higher percentage. This is perhaps a little higher than usual. As most of the eggs are gathered from small flocks with free range, it can readily be seen why the fertility and hatchability run high.

It will not be necessary to go into exact details regarding routine hatching on a large scale. It is much the same as for a small machine, and is only multiplied in extent. Naturally the regulation of the stoves and compartments, the testing for infertile and dead germs, and the various other duties connected with hatching eggs artificially are followed out most carefully, and by men who thoroughly understand their business.

The Sorting Table.

When the chicks are well dried they are placed in boxes and taken up immediately to the sorting and shipping room. This is a most interesting and busy place at the height of the season. As many as 18,000 chicks have been shipped from the Rosemont hatcheries in a single day. The individual orders range from 25 chicks to 1,000 or more. Proper shipping tags have been made out beforehand and are ready to be pasted onto the boxes as soon as the chicks are selected.

It is a most fascinating sight to watch the work of sorting chicks. As many as 1,000 peeping youngsters are placed on a big sorting table at one time. There is a great mixture of color, for here we see the little black Barred Rocks, the spotted Ancona babies, the striped Brown Leghorn chicks, and the fluffy yellow White Wyandottes or White Leghorns. Here and there is a sprinkling of Buff Orpingtons, not to forget the numerous Rhode Island Red chicks. Either Mr. Drumm, or a special man trained for that purpose, selects the chicks for each shipment. So expert and so rapid do they become in this selection that the eye of the man not accustomed to this work cannot follow their motions. And yet in a twinkling each chick has been given a careful scrutiny for defects such as crooked toes, some other deformity, or lack of vigor. Chicks that do not come up to a high standard of quality and stamina are not permitted to leave the hatchery.

So careful has the selection of the hatching eggs been, and so expert their care during the hatch, that the percentage of poor chicks is surprisingly small. After the thousand have been gone over and all chicks selected, only a handful of poor ones will be found left. These crippled or otherwise defective chicks are immediately killed and disposed of. Only by such careful and conscientious selection can the large hatchery expect to develop a permanently profitable baby chick business. The day is past when any kind of chicks can be shipped from a hatchery. The customer may feel assured that a good hatchery chick is as strong and

A Straight Draught Without Any Turns

Cantleak Chimney Flange

Patent Applied For

can be set up on any roof and it will give you straight draught, from your fire up thru your chimney, and a straight draught without any turns is what you want to keep a fire going properly.

Lord Farms, the inventors and manufacturers of the Cantleak Chimney Flange, have been experimenting for a number of years and at last have found the way to obtain a straight and steady draught for the coal burning brooders and mammoth incubators, or wherever a fire is used in an out building.

No wire stays to support chimney—easy to slip it into place and it will stay there. Takes less than two minutes to set up and take down. Write today for one and forget your chimney troubles.

of as good blood lines as though shipped from most commercial poultry farms.

Shipping Chicks.

The chicks have now been selected and placed in their boxes. If the weather is quite cool the ventilating holes are not so large as when the weather is warmer. Most of the large hatcheries have their own punching machines and gauge the size of the holes in the boxes to the weather. This is a very sensible idea, for it is only natural that chicks require more fresh air on a warm day than on a cool, windy one. If the holes are large and the temperature should suddenly lower, a few of them are pasted over so that chicks will not receive too much cool air, and vice versa. If more than one hundred chicks are shipped to a customer, the boxes are kept separate by means of a light wooden framework which prevents the upper boxes from closing the holes in the lower ones. Furthermore, the framework tends to make shipment safer and more easily handled by the postoffice department.

Practically all of the baby chicks from large hatcheries, at least in the East, are shipped by parcel post. On a busy day the postmaster comes right up to the shipping room, weighs the chicks and stamps and cancels the boxes. These are then taken directly to the railroad station so as to avoid unnecessary handling. The chicks are placed on the express car and sent to their destination. This completes the cycle of the hatchery operation from the time the egg is laid until the chick reaches the customer.

Hatchery Business Methods.

The manner in which the hatchery secures and retains its business is naturally through advertising in the first place, and through its satisfied customers in the second. It is surprising what a large percentage of folks order chicks year after year from the hatcheries. They do not hatch chicks themselves, because of lack of time, space, equipment or inclination. Each year they order their supply of chicks, and when they find that a certain hatchery gives them satisfaction, they become regular customers. The bulk of the small order business of a successful hatchery is this class of customers, and they are well taken care of.

Hatcheries also supply large poultry supply houses with thousands of chicks each year. These concerns make a specialty of baby chicks in the spring season, and due to the number of customers they have who are interested in poultry, they are able to do a very large business in this line. Many of them have window displays of chicks under brooder stoves which attract attention. So it is only natural that these stores are able to do a big baby chick business. The hatchery is in a good position to furnish them the chicks they want, because it hatches all of the popular breeds and in such quantities that almost an unlimited number of chicks can be supplied in a short time. This is usually impossible for the commercial poultry farm. The hatchery, therefore, gains the bulk of the business. As has already been mentioned, the so-called five and ten-cent and other chain stores, sell a great many chicks at the time when the hatchery is in full production. Mr. Drumm said in this connection: "We find these stores to be a very satisfactory and convenient way of disposing of many of our surplus chicks. They take up the slack, so to speak, which used to worry us."

Prices Paid by Hatchery.

The hatchery as a general rule contracts for the total number of eggs produced by the ones from whom the eggs are purchased. Some pay a premium of so much per dozen over the top table egg market wholesale prices, varying with the seasons. Other hatcheries pay a blanket price per dozen for the season's output, but as a general rule this is considered too risky. This would have been true of the spring of 1921, when eggs dropped from a high to a low price in a few weeks.

All of the most popular breeds and varieties are hatched, varying in different parts of the country. At present the Reds and Leghorns hold the first place for popularity, but there are other breeds becoming more popular, and the demand is active for perhaps six kinds.

Prices Asked by Hatchery.

This naturally varies with the time of the year and with the breed. The more active varieties usually sell for a few cents less than those whose eggs are not so fertile. Early in the season the best hatcheries receive close to 30 cents per chick, while later they can sell them at 20 cents and sometimes a few cents less than that. Naturally those

hatcheries with a high reputation can ask and do receive the highest prices, and in most cases they deserve them. The hatchery, of course, has its expenses, and the business is by no means one of all gain and no risks.

Hatchery Risks.

It must not be considered that the owner of a hatchery assumes no risk in his business. He is never sure what the demand will be, nor how long and steadily this demand may remain throughout the season. If the winter is mild the demand for early chicks is usually keen, and during the later months much less so. On the other hand, if the winter is severe and the spring late, the demand for chicks is light early in the season and far heavier later on. As none of us can foretell or foresee what the weather man will bring us, it is quite obvious that the hatchery owner is taking his chances along with the rest of us. Buying, as he does, the season's output of many producers, and not daring to contract for too few for fear of finding himself short of eggs for his machines, he sometimes is in the embarrassing position of having eggs relentlessly rolling in by the truckload with few chick orders in sight. On the other hand, the man running a hatchery must assure himself of an adequate and satisfactory supply of eggs for his business. The main reason that some have failed who have entered this business, is because they have not taken this most vital thing into consideration. Without an unfailing flow of eggs into the machines during the busy hatching months, the owner cannot expect a profitable year.

Community Hatcheries.

From present indications, and from what the past has taught us, it would appear that the hatchery is destined to play an even more important role in the commercial poultry producing business in the future than it has in the past. Undoubtedly many other central hatcheries will be established, especially in those parts of the country well supplied with a large poultry population. There is hardly any limit to the future possibilities along these lines, and the next few years will see a number of new enterprises established.

I see also very plainly before me that the hatchery will be used in connection with large commercial poultry establishments cooperatively. We already find that in California the co-operative hatchery has taken root and is flourishing mightily. By this is meant that a large number of poultry farmers may own and operate a central hatchery, thereby eliminating individual hatching. The economic saving is very readily seen.

A hatchery in the community enables the owner of a few or many chickens to renew his stock from year to year at a minimum of trouble. It is a wonderful convenience to be able to order any number of chicks of any variety or breed, to be delivered at a definite time. Of course, one must pay for this service, but it is worth it. We are safe in believing that thousands of people would not keep chickens at all if they did not have the hatchery from which to secure stock. Many people have neither the time, desire, nor skill to hatch eggs—and the hatchery eliminates that effectively and in a most satisfactory manner.

I can see before me in the rather near future the development of the co-operative hatchery in all of the various central poultry-producing points of the country. This hatchery of the future will not alone take care of the eggs of its members, but will hatch countless chicks for outside customers. This means that the cost of operation will be minimized, and frequently a profit will be shown for the members, or owners. It will consequently cost them little or nothing to hatch their own eggs, and frequently they will receive an income besides.

Nor does the hatchery of the future have to stop at supplying commercial poultry farms with their chicks. This hatchery of the future will as well supply farmers in a certain neighborhood with their chicks each season. This will be of great benefit to those busily engaged in spring planting and other duties pertaining to general farming at that season. One reason why chicks are not hatched out early enough or in sufficient quantities on general farms is because there is not enough time to attend to other duties and hatch out a lot of chicks. The "community hatchery" of the future will take care of this perfectly.

Farmer Brown, let us say, will tell his hatchery that he desires 100 Rhode Island Red chicks on March 15. All that he will need is a hover for them, and the care given 100 chicks, as we know, is little more than that given a hen and her brood. The chicks will

be hatched in time so that the pullets will lay well through the winter, instead of the usual low winter farm egg production due to late chicks. The farmer and his wife will have been saved the trouble of waiting for temperamental hens to get ready to sit. We need not go into detail here what such an arrangement can mean to a community of farmers. Better chicks, when they are wanted, more winter eggs, less labor, less trouble—these are only a few of the high points of the advantages of the community hatchery. Undoubtedly every poultry-raising community of this country could support such a hatchery, and the indications very plainly point towards the establishing of many such in the very near future. The hatchery has proven itself a success in every way, and it is for those men and communities who are far-seeing enough to develop its possibilities in the near future. Eventually, as I see it, the central hatcheries will largely eliminate individual hatching.

Points on Chicken Rearing.

We may now be looking forward to, anyhow, short spells of brilliant sunshine, and it is important not to forget the fact that when such do occur the temperature in the rearer rises at a very rapid rate, so much so that not only is it necessary to remove all glass from the covered-in run, but also at times put out the lamp, and, if necessary, provide shade.

Chickens that are being reared by hens should, if possible, always be given more shade than that which may be afforded by the back or side of the hen-coop. An ideal position at this time of year is to arrange the coops on the north side of a hedge and only a few yards away, or provided the hedge is such that the chicks can get through on to the shady side, it is of no great importance on which side the coop is placed. But, failing such natural accommodation, it is most desirable to erect some kind of protection from the hot sun, care being taken to see that the same is not liable to be blown down and injure the chicks.

As warm weather increases, so the time should be shorter that chickens are allowed to run with the mother hen, writes E. Cobb in the Feathered World of England. In cold, bleak weather, such as we usually experience in February and March, the longer a hen will brood them the better, but it is not so when the weather becomes warm. A brood of well-feathered chicks shut up for the night in a coop under a hen's body becomes over-heated, and the close, impure atmosphere breeds disease, and under such conditions the youngsters will not thrive as they ought to do.

If the weather is fine and warm, chickens of the light breeds, such as Leghorns, Anconas, Minorcas, etc., will thrive far better after they are nicely covered with feathers if the hen is removed from the coop, or if they are placed by themselves in a chicken-house, and the slower feathering breeds, such as Wyandottes, Orpingtons, Langshans, etc., should be similarly treated when they are five or six weeks old at the latest, and often far sooner is preferable.

I am, of course, not referring to warm days and cold nights, but to steady time when the temperature is mild and steady throughout the twenty-four hours. To those who have never adopted this system before it will probably come as a surprise to witness the rapid improvement in health and growth of the youngsters when such means are employed. Do not leave them too long in the coops, even when the hen is removed, but place them in a week or so in a chicken-house, with several other broods, if you have them.

With the increase in the temperature, so must the poultry breeder's activity increase in order to guard against insect pests. Do not wait until your chickens are ailing before searching for same. If you allow them to get to the stage that you can see that they are not thriving as they should, and the cause is found to be insects—as it more often than not is—probably a fortnight's growth or more has already been lost which you can never make good again. A check in a chicken's growth is an absolute check throughout its existence, and after treatment will never make up the lost time.

I am frequently asked the question, "What is the best thing to give chickens to create size?" I wish I could impress upon the readers the firm conviction I hold that, although good and suitable feeding and accommodation are one and all requisite to the production of large, well-grown specimens, yet by far the most vital item in answering the foregoing question is, Keep your chickens free from insects.

Comment on Standard Changes.

(Continued from page 709)

I have been reading poultry journals for over 30 years and I can truthfully say that I have never read an article or an editorial that has expressed as much good thought and sound judgment as is in your editorial in the May, 1921, issue, "The Fate of the Standard." The breeders of Standardbred poultry are surely fortunate in having such an able writer as the editor of our leading poultry journal.

Allow me to congratulate you on the fine editorial in the May issue, and to personally thank you as a fancier for protecting our grand breeds of poultry so that we may progress and not destroy what we have. It would be a great mistake to make a breed book out of our Standard. That seems to be the intention of the utility breeders.

The American Poultry Association has wasted too much money on breed books and now it seems to be the object of some people to make a failure of the Standard of Perfection, the guide that has built up the purebred poultry industry, a breeding industry that has been a source of great pleasure to so many fanciers, and enabled them to build wonderful flocks on constructive lines.

Ohio.

A. H. Emch.

I have had three good reasons for writing you but have just procrastinated, thinking the while that I would be in Chicago ere now and call upon you. However, a fourth reason for writing has presented itself today and I really feel that I must indite now.

This fourth reason is your editorial in May American Poultry Journal on the Committee of Forty. So far as Leghorns go, let us always remember that a Leghorn must be a Leghorn as is a Ford a Ford. No time for double standards in poultry nor in life, for that matter. We must eventually make the misnamed utility bird a real Standard bird—never vice versa. I mean we must breed up to the Standard and not down to utility. I am speaking as a breeder of high production Leghorns.

I have seen fowls called Leghorns that were no more than Wyandottes. A six-pound utility Leghorn pullet is not a Leghorn; it is some outlandish cross.

Let us also keep the Standard a book of law, as you so aptly put it. Content ourselves, as the A. P. A., to this point so far as what our Standard of Perfection shall contain inside its covers.

Let the A. P. A. put out books on culling, pigmentation and other side lines as guides but if we allow such subjects in the Standard further than is necessary to assist in and instruct in judging, then we have as an association committed our greatest sin of commission. Again the Standard is only revised once in every eight years—1923 being next. Judging by the strides made to date, these side issues have so rapidly advanced the past few years that it is logical to see how by 1928 or 1930, the methods, means and ways used in 1923 will be as old fashioned and inferior as is by comparison, the movie of today and 1915?

Wm. M. T. Sherwood.

Indiana.

I am of the opinion that 3½ pounds is a good average weight for a good Leghorn pullet, those running heavier before a year old are usually too meaty when about two years old.

I consider the utility qualities very important in the estimation of the value of Standardbred fowls. I am sure one of the best exhibition females I have raised in the past 23 years is one of the best, if not the best, layer (utility hen) I have ever had the pleasure of owning, and she was the most outstanding heavy producer when my birds were certified by Cornell.

L. E. Merithew.

New York.

After reading the editorial in American Poultry Journal for May on the utility Standard and the Committee of Forty, I hasten to take my pen in hand to express my approval of the same. Being a strictly commercial Leghorn man, never handling show birds, no one will charge me with bias for the Standard. And this is how the present Standard and present efforts appear to me.

My point is that the Standard is our compendium of poultry ideals. That being conceded it seems to me lacking in certain particulars which, however, are easily and simply altered. Beauty of form and plumage we must have, else we will have no fancy poultry. As the hen's functions call for egg laying and we know certain extremely heavy pelvic arches prohibit this, we might well make excessive thickness in young birds either a cut or disqualification. Inasmuch as the

CAPONS

WHAT ABOUT YOUR LATE COCKERELS?

They make excellent capons and may be handled at a profit, but quick action is necessary or they will be too old. As cockerels, it is difficult to make them pay.

Would you like capons? Would you like to get the best tools and directions on the market? The following plan will give you both: Buy tools only from makers who sell on the money-back-guarantee-plan. Study, examine, compare and have a public demonstration, or try them out alone. When satisfied by experience which is the best set, return others and get your money back. This allows comparison under working conditions without additional expense—I urge and court this acid test of efficiency and quality.

Examine above design and note its adaptability for removing the generative organs from the bird's interior. With a little experience aided by my illustrated-from-life-directions, caponizing is as simple as A. B. C. Satisfaction and success guaranteed or money refunded. Full set and directions \$5.00. Removers and directions alone \$3.50. Sent prepaid upon receipt of price—no duty—no delay. Order direct from this ad or send stamps for illustrated literature, ideal poultry yard and special offer.

A. E. MOELLER, 261-3 Sumpter St., Brooklyn, N. Y.

male roughly governs shape, and shape is bony structure largely, pelvic arches might well be among the minor cuts of the male. But we should not, any of us, expect the millennium in one Standard revision.

A low-tailed bird is often a good layer just as not all high-tailed birds are heavy layers. The best bred-to-lay male I ever handled was a low-tailed male; although after being put in the breeding yard he carried his tail high much of the breeding season. But there is nothing inherently wrong in a low-tail for a layer.

Pigmentation, toe nails, abdominal capacity, size of comb, and many other "culling" points are all largely questions of feeding and care, and all are also questions of present conditions.

The question of eye color is largely constitutional and is covered now by the Standard.

Show condition is not and should not be laying condition. The bred-to-lay men or utility men should be the first to recognize that. One does not send one's breeding sows in breeding condition to the fat stock classes.

The English Leghorn is not in the Standard and should not be judged by the American Leghorn Standard requirements, but any man buying them does so knowingly.

As I see it most poultry keepers know little about feeding and go into spasms over some feeding result thinking it is breeding. Let 'em holler a year or so. They will learn better. They feed all the grains at once like a kid pounding all the keys of a piano at once. Neither produces attractive results.

Illinois.

W. H. Mathews.

The College Viewpoint.

I read with a great deal of interest your very good editorial in the May issue of the American Poultry Journal. Wish to suggest, however, that if our Standard revision committee finds that they are crowded for room and are therefore averse to including some of the new material proposed on the physiology of egg production and the changes taking place during production, that quite a good many of the pages in the Standard (descriptive material for instance, of the Sumatras, Malays, Malay Bantams, Silkies, Sultans, and Frizzles) could be eliminated without influencing the usefulness of the Standard one-sixteenth of one percent, so far as its effectiveness as an educational agency is concerned. It may, of course, be advisable to publish the new material on the physiology of egg production, et cetera, in a new book, but the new Standard should surely place greater emphasis on the physical qualities that make greater production possible.

Personally, I feel that a good many members of the American Poultry Association have yet to realize that the poultry industry is in good-natured competition with every other animal food producing industry and that in the final analysis, the only things that will make this industry stronger and more important are the things that will influence the food-producing efficiency of our birds. It seems to me moreover, that there need be no antagonism, but that good form and good plumage can be combined in the development of the most productive types.

Frank E. Mussehl,
Professor Poultry Husbandry, Nebraska College of Agriculture.

A Comprehensive Letter From a White Wyandotte Breeder.

I am in favor of having the Wyandottes described as having backs and shanks of medium length. We wish to get away from that "dumppishness" that has characterized the Wyandotte of the past, and which has tended to almost destroy the utility value of the breed. I never could see anything in those short backed monstrosities. The best interests of the breed will be served, I fully believe, by having the Standard describe the back shape as medium length. My idea of what constitutes the ideal Wyandotte is depicted admirably in the cut of John S. Martin's first and champion cockerel, Heart of America show, which illustration appeared on page 689 of American Poultry Journal for June. To my mind, this bird is "all there" and offers little room for improvement. We could do no better than to use this bird as an ideal. The back is short enough for all purposes without destroying the Wyandotte's own particular shape. This bird has the shape that means a big stride in the advancement and improvement of this wonderful variety.

Also, in reference to the length of shanks, wish to advise that I admire neither a low

down, squatty bird, nor one that is "stilty." I like to see the birds with considerable daylight under them, but of course we must avoid going to the other extreme, i. e., putting them up too high and getting too much open space under them. Therefore, I am in favor of having the next Standard revised so as to designate the Wyandottes as having medium length shanks.

There is one more change that I would like to see, and that is in having the tail shape described as "broad, well spread the entire length," instead of "broad, well spread at base," as the present Standard designates. I think the beauty of the bird is greatly enhanced by having the width of tail extend all the way through, clear to the tip. By calling for a well spread tail at base only, we often get the triangular formed tail, which gives the pinched, and, in my opinion, undesirable appearance.

Your editorial, "The Fate of the Standard," in the May issue, is right to the point, and you are to be commended for the fearless way you voice your opinion and take up the cudgel in behalf of the Standard bred poultry interests. This editorial should be perused carefully and digested thoroughly by all breeders. I have read it over several times and can say I am heartily in accord with nearly all you state. I believe the yellow legged breeds will be benefitted if allowance is made for leg and beak color fading, and have incorporated in the Standard text, instructions appertaining thereto. But I believe, when this is done, the judge must, when making due allowance for the absence of pigmentation, to judge the fowl also for egg production by noting the abdominal capacity and condition of pelvic arch, to ascertain whether the said bleaching out of leg and beak color is really due to heavy laying and not to the method of feeding and management.

In regard to the chapter on Production that the utility men are striving to have incorporated in the Standard, I can only say that I hope you will be relentless in your endeavor to keep this out. Such matter has no place in the Standard whatever. The Standard is, as you say, a book of law. It is the judges and breeders guide—a book of rules. All other information relative to poultry breeding should be published separately. When one buys a Standard he

buys it merely to ascertain what constitutes the ideal bird in the different varieties of Standard bred poultry, and not to obtain a complete course in poultry breeding.

I note what you say about production and exhibition classes at the shows, relative to having separate classes for same. Now, if the production classes are composed of Standardbred birds that must score not less than the present minimum scores which are necessary to enable specimens to win prizes under the Standard, then I believe this would be a good thing, as it will put the breeders on their toes in striving to breed for production as well as exhibition, and get heavy laying ability in their quality birds. But, on the other hand, if merely utility birds, regardless of Standard qualifications are to compete for prizes along with the Standardbred birds, then I believe it to be a bad thing, and should not be permitted at any show. You are correct in stating that the distinction between these two classes will reflect to the disadvantage of the high grade exhibition bird. There will be little demand for the latter, as it will be considered in the light of having been bred for feathers only—a mere bauble. It will be considered of no earthly use as far as production is concerned.

Indiana.

Otto E. Hackman.

A Columbian Wyandotte Fancier Discusses Points of Interest.

I have read your editorial on Standard changes with much interest and can take no exceptions to anything you say.

These "utility" breeders want to "hog it" all and for myself I do not see wherein they should get into the next Standard. It would appear that the Standard, with the description and scale of points, covers all the utility features demanded, such as symmetry, size, conditions, shapes of head, etc., and only tails, from the "utility" viewpoint, in an exactment for color and markings of plumage over the whole bird, and in color of eyes. All other sections are as important in a utility specimen as in a Standardbred. I am not sure but what uniformity of color of plumage should also be important in the utility fowl.

The Standard has 75 points (or more)

that are as essential to the utility as to the Standardbred fowl. If you agree that uniformity of color counts in utility, then the whole myth of a separate Standard for utility absolutely fades away.

To fill up the Standard with all this stuff about fading pigments, and spread of pelvic arches, is all "bunk."

In regard to the Committee of Forty's recommendations about lengths of back, thighs and shanks in Wyandottes, would say that I have never seen any Columbian Wyandottes with backs too short for my liking. The White Wyandottes may have been bred too short backed but all other Wyandottes would be improved in looks by shortening up their backs, making them rounder in contour, to my way of thinking.

The Wyandotte should be a "bird of curves," and any attempt to lengthen backs or bodies, legs or thighs, would spoil their characteristic appearance. Also I take no stock in the claim that short bodies mitigate against their laying ability.

I have also read the article in the May Journal by (Rev.) T. W. Harwood, on the question of under color and do not at all agree with him. Under color is not given too much importance in the Standard, or in proper and wise judging at our exhibitions.

Rev. Harwood speaks of R. I. Reds in the show rooms. I know little about Reds, but if the question were raised on Columbian varieties I would insist that the "bluish slate" under color is all important. Suppose a possible customer for Columbians visits a show and looks them over from the outside. He is attracted by a fine looking hen, one that has white surface, good type, style and everything except under color. She wins no prizes, but because she looks well on the surface, the possible customer buys her. He takes her home, thinking she will breed him some good chicks. He finds afterwards that she is useless as a breeder as she had no under color. Thus he learns his lesson by experience as many a one has done before.

Any judge who had ever bred the kind or variety of fowl he is called upon to judge cannot but be influenced in his judging by what he knows of the specimen's breeding possibilities. The breeding problem is and must be in his mind. He cannot help favoring specimens he knows are good breeders.

Pen drawing of photograph from the Ward Poultry Farm, Stockbridge, N. Y., where 20,400-egg Candee Incubators are used. (See Nov. 1920 issue of this paper.)

CANDEE

GIVES CHICKS THE RIGHT START IN LIFE

CANDEE-Hatched chicks are healthy, sturdy and vigorous because they are incubated under proper conditions. They develop rapidly into heavy egg-producers, the kind of birds you want to own.

Eggs Never Overheat in the Candee Successful hatching depends much upon maintaining a correct hatching temperature from the time the eggs are placed in the incubator until they are hatched.

The CANDEE incubator does away with all worry in this regard because of its exclusive, patented, double automatic temperature control and perfected ventilating system that absolutely eliminates the dangers of overheating and chilling while assuring proper ventilation without loss of the original moisture of the eggs. In other words, eggs hatched in CANDEE incubators are given conditions as near like actual hen-hatching as is possible mechanically.

The temperature in each hatching compartment is controlled by an automatic regulator, while another automatic regulator controls the drafts on the heater and the water temperature. Set at the proper degree, this regulating system compels constant, correct heat, no more—no less, regardless of weather conditions, temperature changes or storms.

Our Big, Free Catalog Gives in Detail the Many Advantages of Candee Incubators

You will find our large, beautifully illustrated catalog an exceptionally interesting book on chicken-raising. Send for your copy today.

OSZARK POULTRY FARM, J. V. Frazier, Prop.

PURDY, MISSOURI

R. F. D. ROUTE No. 2

In the matter of under color the Standard for the Columbian varieties shades what it should be. It is right and proper that it should so state, otherwise mating and breeding without this knowledge of under color would only lead to confusion and failure to produce specimens of exhibition quality.

Rev. Harwood speaks of Columbian females that were passed by for "gray in their backs." This gray in the backs is a defect in surface color and has nothing whatever to do with under color. Often the female with the purest white surface color has the deepest shade of under color; in fact, females with very dark bluish slate under color generally have pure white surface color. This is shown in the illustration of feathers (in the May issue); there is what is termed "a break" between two sections of the feathers, the surface color being clearly defined and separate and distinct from the under color.

No one is more insistent than I that judges should not waste their time in searching for trivial or hidden defects, yet in the matter of shades of under color in Columbian Wyandottes, the matter is so important from a breeding standpoint that it cannot safely be passed by without giving it proper consideration.

Massachusetts.

Ralph Woodward.

From the Secretary of the Madison Square Garden, New York Show.

I have read with much care the leading editorial in your May issue, and needless to say it fits me exactly. I should judge that about the same time you were writing this editorial, I wrote a little article along the same lines. The Standard of Perfection should deal in nothing but the highest ideals in beautiful colors and outlines, such as we now have. I wish to congratulate you most heartily for the stand you have taken. I am with you to the end. The best types of our Standard birds can also be made our best layers and as long as I am secretary of any poultry show, I will have only one class of judging, regardless of what the American Poultry Association may do. Nothing shall rob us of our inheritance; but so many lack the backbone, and the American Poultry Association has been allowed to drift into paths which its founders never intended it to travel, and now it would seem that it was completely out of control.

D. Lincoln Orr.

Endorses Work of Committee of Forty.

When you read some of the views of some of our friends who find delight in writing articles for poultry journals, questioning the sincerity, honesty, wisdom and motives of every one else but themselves, you wonder, after all, if the work, time and money that is spent in trying to promote the American Poultry Association is really worth while. When you look about you and can see men whose nests have been feathered by the work of the American Poultry Association, whose whole life and existence in the past and at the present time has been largely dependent upon what the association has done for them, throwing stones at their fellow members and trying to tear down attempts at constructive work rather than to co-operate, you wonder still more.

The only way that the world makes any progress is by new ideas being advanced. This is true in every line and of every profession. The only way that we can make any improvement in the poultry industry is to advance new ideas, broaden our vision, improve the weak points where possible and go forward rather than stand still or go back. The only way that this can be done is for those who oppose and those who favor ideas of improvement and advancement to get together on common ground, thrash out their problems, advance arguments on both sides, and then adopt the ideas and methods which seem best and most reasonable. If our past Standardmakers had not added new ideas, adopted new illustrations, made new improvements, the present Standard would have been no better than the first, and we would not have had the beautiful, symmetrical, productive, modern fowl that we have today.

It may interest you to know that some of the greatest knockers on the work of the Committee of Forty, and on any new idea or advancement being made in the affairs of the American Poultry Association, are men who have refused to attend any of the meetings of this committee and who have refused to co-operate or find out what there is to the proposals which have been made. It may interest you to know that three of the greatest

knockers who are contributing articles to various poultry journals, questioning the motives of this committee, are men who have knocked the American Poultry Association for several years. They refuse to hold their shows under the American Poultry Association rules. They have even gone so far, in some cases, as to have certain varieties of poultry judged by a standard other than the American Standard of Perfection. One of these writers does not judge according to the Standard of Perfection, but according to his own ideas of what the ideal should be.

As far as the work of the Committee of Forty is concerned, the facts are these: Last year there was hardly enough life in the American Poultry Association to even enthruse prospective members. It was general comment everywhere that the convention was coming to Kansas City in August to have the last rites performed over its remains.

On the one hand we had men writing articles, knocking the old association, claiming that it ought to be strictly a fanciers' organization; on the other hand we had thousands of farmers and poultrymen who raise Standardbred poultry, who were claiming that the association was doing practically nothing to benefit them. With the idea in view of trying to harmonize these two extreme views, if possible, a resolution was introduced asking that a Committee of Forty be appointed to see if something could not be proposed that would bring these different factions together, that would strengthen the association and benefit the entire poultry industry.

In my report, as secretary of the committee, I could not give the full report, or give the reader much of an idea as to what was undertaken or accomplished, or what the final and complete report would be; but I am safe in saying here—first, that the American Poultry Association had the authority to appoint such a committee and it met with the unanimous approval of those in attendance at the last convention; second, that this committee had a right to proceed with full authority under this resolution to transact the business that was outlined for the committee; third, that no attempt has been made by the committee to obligate the association for a single thing, or to take away any of the authority or the work of the Standard Revision Committee, any officer, or any individual in the association, every officer and every committee having the full right and authority to proceed with their work as vested in them by the constitution, not one bit of authority being taken away from them; fourth, that their sole aim and purpose was to make a thorough investigation of some questions of interest and benefit to the association and industry, and that these be reported to the next convention and to the Standard Revision Committee for their consideration, to adopt or reject as they see fit. In the above the Committee of Forty has assumed no authority that was not granted to it unanimously, and they have not trespassed upon, prevented, hindered, or interfered in any way with the work of any officer or any member of any committee of the American Poultry Association or anything that they might want to do. They have done a work that was needed, and at a time when it was needed, and have done it without one cent of expense to the association. When their report is made there is nothing that compels the association to adopt a single thing that is recommended unless you feel that there is some merit to same, and some of their recommendations I expect to oppose myself.

As far as the Standard of Perfection is concerned I am not in favor of burdening it with statements about lice, mites, poultry houses, feeding, and things of that sort. It should be a Standard solely for the judging, selection and breeding of Standardbred poultry and eggs.

There is no danger of a majority of the members of the Committee of Forty voting to injure in the least degree, or detract in the least way, from a single thing that is in the present Standard. Any statement to the contrary is absolutely false.

Many statements published about what is proposed have been exaggerated and misleading. The interests of every breeder of Standardbred poultry must and will be protected to the fullest extent. But the Standard is not perfect in every degree. There are certain weaknesses in it which must be corrected. There are certain additions which should be made to broaden and improve our present Standard.

Instead of admitting a lot of varieties that are obsolete and are not bred and never will be bred by half a dozen people in the whole country, it is better to devote more space to more practical and modern ideas and improvements that will help every variety of poultry, that will increase the sale of the

Standard, that will make it more practical and useful, and create a far greater demand for Standardbred poultry. I know it to be a fact that one of these parties who is doing the most complaining has advocated the admission of breeds into the Standard in opposition to and regardless of constitutional provisions. They would violate the laws of the association to satisfy a personal desire or ambition. One of these same writers would not have a meeting of the association held for five years and would like to have the sole management of the affairs of the association during that time. Yet, he is one of the loudest in proclaiming in his articles that everybody has an axe to grind except himself.

Friends, when are we going to settle down in the American Poultry Association to a friendly, common sense, business basis? When are we going to quit throwing stones and spend our time and energy in building up our business and our industry? When are we going to lay aside personal likes and dislikes and go out to fight to make our industry mean what it should to every farmer and poultry raiser and every one engaged in any branch of the business? When are we going to fight to promote our business and encourage people to eat more poultry and eggs, to pay a better price for same, and to breed more Standardbred poultry instead of cross-breeds and mongrels? Are we going to limit our association to strictly a fanciers' organization, or are we going to make the American Poultry Association take the lead in all good work for the advancement of the various branches of our industry?

No attempt is being made to tear down the Standard of Perfection, and not one single thing that is in the present Standard which pertains to any variety will be minimized in any way. Any new chapter that is prepared for the Standard will be submitted to the Standard Revision Committee and it will be up to them and to the association to adopt any part or all of it as they see fit. The constitution itself provides that the Standard Revision Committee shall edit the whole Standard so as to secure uniformity of technical forms and expressions, and of course they will not recommend any chapter to the association that would be in conflict with anything in our present Standard. We shall not, and never will, have in our Standard of Perfection a utility chapter that will stand in direct opposition to the Standard type or description of our Standardbred fowl. Any statement to that effect is absolutely false and is made for the purpose of misleading you.

If we understand the constitution, a new Standard Revision Committee is appointed every year, and no three men or set of individuals have a lifetime lease on a position as a member of the Standard Committee. We trust that the Standard Committee to be appointed at Seattle will be big enough, broad enough, fair minded enough, and considerate enough, to give due consideration to all facts brought to their attention and that they will adopt those ideas which seem right and best, and be cold-blooded enough to turn down and refuse to O. K. anything detrimental to any breed or variety or to any branch of the industry.—T. E. Quisenberry.

Dark Cornish.

A glance at a Dark Cornish will indicate the great width of breast, the short wings and thighs, and general impression of solidity which characterize this fowl.

The Indian Game is an old breed, and in the pure state only a moderate to indifferent layer. Neither is it a fast grower as a chicken, though the birds are always heavier than they would appear to be on account of their natural fleshiness and shortness of feather. Because of these facts most raisers of table poultry prefer the Indian Game as a blend with something else. A sire of this breed mated with any of the heavier class of hen—Orpington, Wyandotte, Sussex, Dorking, or Rhode Island Red—will produce chickens that are second to none on the table. They mature quickly, fatten naturally (i. e., they are always plump), and for flavor, quality, and texture of flesh they have no rivals.

Then the extreme hardness of the Indian Game is a point in its favor. It is peculiarly well adapted for an open range, where it proves a good forager. But that is not to say that it will not also do in limited runs. For many years the breed has been popular with fanciers and those who breed for exhibition, and with these it has long established a reputation for being an easy doer in comparatively cramped surroundings.

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

THE GUINEA FOWL.

First Prize Article.

Since wild game has become scarce in the large centers, there has sprung up a demand for something to take its place on the tables of hotels, clubs and wealthy homes. This demand is being supplied by young guinea fowl, weighing around two pounds each alive. We have raised a flock of these birds for several years and have found them easy to care for and profitable as well.

We hatch the youngsters in July

A pair of Pearl Guineas. The male is on the left; female, on the right.

and have them ready for market in October or November. Prices are usually best around Thanksgiving. Some years we have received as high as \$2.50 per pair for two pound birds and never less than \$1.75. This gives a good profit for three months old birds, especially as guineas are capable of picking up a large part of their living. We always market them alive. If marketed dead, they are usually sold with the feathers and head on.

We keep during the winter from six to fifteen hens and two males, perhaps three or four to be on the safe side. Sometimes a male will mate with but one female, although this is uncommon. Usually the eggs are very fertile. Hens begin to lay in April. As the birds are housed with other poultry, the first eggs are laid in the nests in the house. Later they are laid outside in the grass or bushes. It is an easy matter to find these stolen, as the male stands on guard while the female is on. The female also utters a peculiar call while on the nest which is distinctive from that made at any other time. When the nest is found, leave six or more eggs in it, else the hen will find another place. Often the whole flock will lay in one nest and it will not be

necessary to stop them until a hen becomes broody. By removing the bird a few times at night, she can usually be broken of this desire but if she persists, it is only necessary to remove all the eggs, then the hens will seek another nest.

Our birds average about one hundred eggs each during the season, beginning in April and ending in October. The chicks are hatched under common hens, as the guinea makes a very poor mother. Eggs require from twenty-six to twenty-eight days to hatch. The shells are hard

but if nests are made on the ground, the youngsters will pop out of the shells without trouble. As the chicks are small, it is necessary to confine them in a tight coop for a week. At first they do not seem to understand the mother hen's cluck and are apt to run away unless confined. Later they learn her call and ever after they stick by her, even when grown up. This year we raised a flock with a Black Langshan hen and it is a funny sight to see her on the nest laying with a dozen full-grown guineas standing and sitting as close to her as they can get. We usually dispose of the old guineas in September, as it has been found that old birds do not lay as well as the young ones. However, when we have kept them over for the second year, the old birds adopt the young ones in late summer and lead them far a-field in search of grasshoppers and insects.

Young guineas require a little care for two weeks after hatching. Keep them shut in the coops until grass is dry and also all day in cloudy weather. When the feathers begin to start, they grow hardy and able to withstand wet and more cold. They are rather tender at first but after reaching the age of four weeks, we never lose a bird. The little fellows are fed like other chicks, several times a day at first. Later they pick up most of their living. Guineas cannot be confined unless wings are clipped. They will fly like any wild bird. Naturally they are a little wild but show no fear of persons who are accustomed to care for them. Strangers, as well as strange dogs and cats, are spotted at once and they are not slow in raising an outcry.

As sentries they are of considerable value. We have never lost a guinea to hawks or foxes. These pests have visited our yards, however, but the guineas spot them immediately. We have seen a guinea cock pursue a hawk into the air, after the marauder had visited the chick pen. The male guinea is a natural watchman and the slightest unusual circumstance is a signal for him to set up his raucous cry. The female guinea has a different call, which she keeps repeating over and over all day. She can also speak the language of the male if occasion requires and is not slow to do so if danger threatens. The male cannot enunciate her "buckwheat", however. This is the surest way to distinguish the sexes.

There are two common kinds of guineas—the White African and the Pearl. We have kept both but like the former best. In our experience the white is not as wild as the colored. Either kind is profitable from a commercial standpoint.

N. H. C. H. Chesley.

PROFITABLE BACKYARD FLOCK.

Second Prize Article.

Many people living in town or in suburbs often make the statement that it costs more to keep and feed a small flock of hens than the eggs and fries are worth. However I believe that under average conditions backyard poultry keeping pays well. The record given below tends to bear this out, and although it has certain items which are estimated, it is a very close approximation.

The feed cost was averaged each month and represents only the feed purchased. Value of eggs was based each month on current local market prices, averaging for the year 53 cents a dozen. The cockerels raised from eggs bought were sold for breeders and seven were traded for five hens and a rooster. The three brought \$3.00 apiece and those involved in the trade were valued at the same price. The remaining five sold brought \$6.02 and those used were therefore valued at \$1.20 each.

The number of hens varied from month to month but averaged 18 for the year. Those priced at \$3.00 each are pure bred Rhode Island Reds and the other twelve which are listed at \$2.50 each are grade Barred Plymouth Rocks, the same as the 20 on hand at the first of the year. There are now 13 April and May pullets in the flock, and 15 yearlings.

Inventory 1920—20 hens	\$2.50	\$50.00
Inventory 1921—10 hens	\$2.50	25.00
5 hens	\$3.00	15.00
11 pullets	\$3.00	33.00
2 pullets	\$2.50	5.00
1 rooster		6.00

Feed bought	100.00
Eggs bought (setting)	4.50
Eggs sold or used	113.97
Chickens bought	21.00
Chickens sold	36.02
Chickens used	15.60

175.50 249.59

Net profit 74.09

The average net profit per hen was \$4.11 for the twelve months. These hens laid a total of 2654 eggs or an average of 147.5 eggs each. This is not a high record and was made under average conditions surrounding ama-

PROFITABLE LEGHORNS

Before buying pullets for egg production you should write and learn about our free range trap-nested S. C. White Leghorns. They are hatched right, raised right and sold at very reasonable prices, from \$1.50 each, and up.

We also make a specialty of furnishing poultrymen with pedigreed vigorous cockerels that are guaranteed to put pep in your flock. Buy them at broiler size, \$25 per dozen, and up.

Queensbury record making yearlings for breeders are now being sold at half price, ranging from \$2 up. Whenever you see this trade mark remember that Queensbury Leghorns are guaranteed to please you.

QUEENSBURY FARMS

teur poultry keeping. The housing was in this case the limiting factor and this I believe is true in most cases.

I conclude from this year's experience, that the three most important factors are breed, feeding, and housing—a conclusion based on other people's experience. What I mean to say is that if I had chosen an egg-laying breed and possessed a real-for-sure chicken house I could have got more eggs and a higher profit per hen. No doubt my feeding could have been improved too, but that is a day to day problem and can be solved satisfactorily. The breed is a matter of choice and the housing question must be settled at the start once for all. A good house, if one is to be built, will cost very little more than a poor one, but the poor we seem to have always with us.

Here's the kind of house my hens have: Single walls and roof, not wind-proof, 10 square feet of window surface to 110 of floor, ventilation poor, dirt floor. The litter is usually too damp, especially in very cold weather and moisture collects on the walls and roof. This winter I have removed one window and hung burlap over it and expect to leave it that way all winter, as it gives better results than when I had the window closed.

Here is the kind of house I believe would increase the egg production: Double walls and roof throughout, wind-proof, about 40 square feet of window surface to 100 of floor, good ventilator, solid floor—perhaps concrete—all inside surfaces as smooth as possible, and artificial lights for use in winter. My aim in building this house would be to avoid all drafts, keep the litter dry by thorough ventilation, and keep the floors, walls and roosts clean.

Here is the way I feed in winter. The first thing in the morning the hens are given warm water and a small amount of scratch feed. After they have scratched awhile they are given a quart of soaked oats. About 11 o'clock a warm wet mash of table scraps and about 2 pounds of commercial mash is fed. At 1 P. M. they get about a pound of scratch feed again and at time to go to roost two pounds.

In addition to the above the hens have all the chopped carrots they will eat, as well as dry mash. They have access to oyster shell and gravel, but never had any charcoal medicines. In summer the hens run out, but receive a wet mash in the morning and plenty of scratch feed at night. They do not seem to eat much dry mash when running outside.

The above figures are for about 25 hens. I do not weigh the feed but use a measure which I have previously weighed up and vary the amounts to the number of birds changes and as other conditions seem to warrant. No abrupt changes in quantity or kinds of feed are made.

Ill. W. V. Whitehead.

Lewis County Farm Bureau, West Virginia, has raised \$3,000 to build and equip a mammoth hatchery at Walkersville, W. Va. The hatchery will be a farmers' co-operative enterprise. White Leghorns, mated by R. L. Mason of the State Agricultural College, will supply the hatching eggs.

The Newtown is the sure-thing incubator —not a “hard luck” machine

How often, at the end of the chick season, you hear men say “Well, it would have been a big year for me if my incubator hadn't gone wrong.” Then you get the hard luck story about break-downs at critical times—valuable eggs spoiled—poor hatches—weak chicks.

But users of the time-tried, trouble-proof Newtown are not in this “hard luck” class because they selected “the incubator that hatches the most chicks, the best chicks, with least labor and at lowest cost”—the one that always delivers the goods.

A mighty strong statement? Sure! But backed by the facts. The Newtown sells on its *record*, not on mere *claims*—is preferred by thoughtful poultrymen because of what it *has done* for years under the widest range of conditions, not what we *hope* it will do.

Newtown supremacy is universally acknowledged. The record is clearly written. You can see it in successful poultry farms and commercial hatcheries in all parts of America—in England—in far Australia. And here you have the final proof that you, too, can succeed with the Newtown.

The purchase of an incubator of large capacity means a considerable outlay of cash. Why not play it safe—protect your investment—insure satisfaction and profit! And not for one season alone, but for many, many years because the Newtown is built not only to produce biggest hatches of strongest chicks but to render *long-time service* also.

You should learn, in detail, about the remarkable Newtown construction—finest of materials and careful, conscientious workmanship. About the many exclusive Newtown features which protect the valuable eggs—insure wonderful hatches—reduce labor to the lowest terms. You should see the reports of results secured from the Newtown by the world's foremost poultrymen. All these important facts are presented in our catalog, a copy of which we will gladly mail you on request. Better write or wire for it now.

Our revised prices for the coming season will please you. And if you are in position to place your order for early delivery we have a special proposition that will interest you. Take our word for it—it will pay you to get in touch with us quick. Just tell us what egg-capacity you are considering and we will do the rest. Start that letter or telegram *today*.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

Would you please give me some information about the Grand Bay County, Alabama Do you think it would pay to start a poultry farm down there?
Illinois.

Gus Leljo.

I would not advise you to undertake the operation of an exclusive plant in that section. It is better suited to the production of cotton and general farm products, with poultry as a part of the units of the farm.

* * *

I have been making inquiries as to the practicability of North Eastern Louisiana (particularly around Baskin, Franklin Parish, La) for diversified farming, meaning combining fruit, poultry and a few cows. Of course the land agent drums up what he wants to sell.

I want to get a small farm for myself and make use of my knowledge of horticulture in growing an orchard for my own, instead of always doing the work for some one else.

I am managing an apple orchard of 40 acres, consisting of 1800 trees of the following: Bens, Ingram, Black Twig (Mammoth), Arkansas Blacks, Winesaps, Grimes Golden, Starks Golden Delicious and Golden Sweets.

I have tried farming in several states, Montana, North Dakota, Minnesota, Indiana, Michigan and Illinois. Was raised on a fruit farm in Michigan. What about raising two (2) crops a year on this land in Louisiana? Illinois.
C. B. Jacobs.

The land to which you refer is cut-over land. It has a light sandy soil, with a clay sub-soil. It is easily worked and

productive. There are opportunities there for one who will work hard. It is a good situated fruit section, but market conditions are not the best. It is destined to become a good dairy section. I think a combination of dairy and fruit a good one true. Yes, two (2) crops can be grown each year.

* * *

I have just bought a three acre farm on the edge of Libertyville, which has a population of 3000 people, and just 35 miles from Chicago. I would like your advice in regard to setting the land to apple trees for commercial purposes, if you think I could make it pay me a profit. My land is high and slopes to the south and is kind of a sandy loam. I would like to set all the land to Red Delicious and Golden Delicious if you think they would do well where I am, also let me know if I should include more varieties. Would like to set out some crab apples, a couple of pear trees, one summer pear and one late pear, one quince tree if you think it would be alright. A couple of plums, one summer and one a little later, how about Mammoth Gold and Omaha plums? Also let me know the best black raspberry to set, and where can I buy the royal purple raspberry? Would like to set out a few roots of rhubarb. What kind is best? I have grapes and cherries, and some apple; want crab-apples, plum, quince, pears and berries. I have never had any experience with fruit, but have read a great deal about it. Now don't you think that a man who is interested in fruit and who is willing to work can raise fruit and find a market for it? Should the orchard be cultivated all the time? If so how would it do to plant corn between the trees until they come into bearing? When is the best time to plant fruit trees and berries? I want your honest opinion. I have faith in you, and will do what you tell me I should do.

Illinois. W. D. Lyons.
Can a man "who is interested in fruit and who is willing to work raise fruit and find a market for it? Of course he can. And this means you. You have chosen wisely in selecting Delicious and Golden Delicious. They are very profitable varieties and adapted to your soil and climatic conditions.

In deciding upon the other fruits you wish I would choose the following varieties: Crab Apple: Florence. Pears: Lincoln and Seckel. Would not set out any quince. They will winter kill. The Mammoth Gold Plum is not hardy enough for your climate. A few years ago the severe winter killed all these plums on the farm of the originator, Mr. Rheil, in Southern Illinois. Plant Surprise, Terry, Omaha and Wyant Plums and you will have abundant crops. The Cumberland is the best black raspberry. You can get the Royal Purple raspberry from Whitten & Son, Bridgeman, Mich. Linneaus is the best rhubarb. Yes, the orchard should be cultivated each year until middle of July, when a clover crop should be sown, this clover crop to be plowed under early in spring. You can raise corn between the trees for a time. Best time to plant fruit trees and berries is in early spring.

* * *

In answer to Mrs. C. W. Porter, Maryland: Asheville, N. C., is a beautiful city and one which is very desirable as a residential city. It has an elevation to about 2400 feet above the sea level. Orchard land in the near vicinity of the city can be bought for \$25 to \$100 an acre. The Stayman Winesap is peculiarly adapted to conditions there and you will make no mistake in planting largely of this variety should you locate there.

My Sapa and Opata plum trees, set out a few years ago are full of bloom to-day. I shall not allow them to mature much fruit. These are the hybrid plums originated by Prof. Hansen of

JOHN L. BROWN

65 Indiana Ave.

ANDERSON, INDIANA

the South Dakota station. They are a wonderful creation and will be of great benefit to people in the far north.

I am much interested in the poultry business and have about decided to buy a small place of between 30 and 40 acres, and intend to look at farms in the eastern section of Pennsylvania, and that part of Maryland and New Jersey that is near Philadelphia. Can you advise me if you think such a size farm would pay, there being my wife, daughter, son and self, both son and daughter are grown.

I would have a small orchard for home use and a garden sufficient for home use, intending to make my money from poultry. In this connection can you advise the attitude of the commission men or brokers handling eggs and chickens in the Philadelphia and New York market. I have heard much of commission men protecting their own interests at the expense of the farmer, and am wondering if the poultry men of the eastern section are entirely dependent on the prices set by commission men.

West Virginia. J. C. Couan.

Yes, a 40-acre farm, properly managed can be made to pay well. The section you mention is a very desirable one. There are many honest and reliable Commission men in New York and Philadelphia.

I have been using poultry manure as a fertilizer on my onions and radishes. Worms are eating these vegetables. Is this because of the poultry manure. What chemicals will kill these worms?

Indiana John K. Kepp.

The poultry manure is not responsible for the presence of the worms. Spray the vegetables with arsenate of lead. If the worms are working below the surface, scatter tobacco dust along the rows of vegetables or saturate the ground with Black Leaf 40.

What is your opinion of the state of Delaware farming and living conditions; have been offered a cheap place down there close to Seaford. Poultry and hogs are my fancy. New York George Hanford.

Delaware is very favorably located as to market facilities. The land is productive, the climate good. I took a trip over the state recently. There are some very profitable fruit and poultry farms near Seaford. Poultry and hogs ought to be a splendid and profitable combination for that section.

Heed the Call, "On to Seattle."

By P. W. HARRIES

Every thinking poultryman will agree with me when I state that the convention which will be held in Seattle, Washington, August 8th to 13th, 1921, will be the most important that has ever been held in the history of the American Poultry Association. Therefore, every poultryman who possibly can, should make a supreme effort to attend the convention and help solve the important problems that confront our organization.

Among the most important problems to be solved are the following: The Chinese egg question which has been the most serious menace to the commercial egg farmers, bringing about a state of affairs that must be remedied as soon as possible. The appointment of a managing secretary or director for the A. P. A. which will be threshed out probably in heated discussion; also the report of the Committee of Forty on Standard Revision and other important matters. Constitutional amendments will come up for discussion which should have the serious consideration of every member of the association.

Let as many as can possibly attend this most important of all meetings in Seattle, do so. Plan at once to come and you'll not be disappointed. Besides the serious matters to which your attention has been called, please dwell for a moment on the great welcome each member will receive when he reaches Seattle. Everything possible has been planned by the entertainment committee to show the wonders of the Pacific Northwest to visitors from the east and south. We have been accused of bragging about this Puget Sound country from time to time. Now we will have to prove to you all that here is the ideal spot of the whole world for poultry raising—also for touring and a general good time out of doors.

Poultrymen traveling by way of Chicago to the convention are invited to write E. G. Aldrich, care of American Poultry Journal, who will be glad to make reservations for them on the special cars that will carry a number of eastern poultrymen. This train will leave Chicago August 5th. Mr. Aldrich will also be glad to furnish any information regarding rates.

OUR COVER.

The Pekin Ducks illustrated on our front cover this month represent fine specimens of this breed. The first Pekin Ducks were imported into America from China in 1873, by J. E. Palmer of Connecticut, who had been traveling in the Orient and had found the ducks at Pekin, China.

This breed is very popular as a commercial duck. There are large duck farms on Long Island that produce ten to eighty thousand young ducks a year. The ducks are grown until about 10 weeks old, when they average close to 5 lbs. each.

In breeding ducks, the male is distinguished from the female by having two curling feathers over his tail.

CLASSIFIED ADVERTISEMENTS

UNDER this heading ads will be inserted for fifteen cents per word each month for less than three months, or *thirty-six cents per word for three months*. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under *classified headings*. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from AMERICAN POULTRY JOURNAL than from any other poultry journal—none excepted. On writing any of these advertisers, mention AMERICAN POULTRY JOURNAL. All copy for Classified Ads must reach us by the 17th of month preceding the date of issue. These Rates Void After May 20th, 1922.

as a winner of
prizes.

Breeders of
Single Birds
Pairs
Trios
Pens

When, in selecting your birds for next fall and winter shows, you choose Oak Dale Single Comb White Leghorns, thousands of breeders will confirm your judgment. Oak Dale Single Comb White Leghorns have won most of the prizes offered at Boston and Madison Square Garden shows for the past 20 years and they will continue to be the winners and the leaders because every Oak Dale bird will reproduce itself and, therefore, reliability exists in its breeding.

Eight to Ten Weeks Old Pullets

We offer for immediate sale a limited number of eight to ten weeks old pullets from pens 31 to 65 at these remarkably low prices: In lots of less than 25, \$2.50 each; and lots of more than 25, \$2.00 each.

*WE WILL TAKE A FEW ORDERS FOR
BABY CHICKS IF ORDERED IMMEDIATELY*

E. B. Thompson's Imperial Ringlet Barred Plymouth Rocks

Win at the Premier Show of All the World
Madison Square Garden
New York, January, 1921

The Greatest Record of All Time

First Prize Cock at Madison Square Garden, New York, 1919—The Sire of First Prize Cock of 1921

Every Prize and Ribbon Offered

Cocks	- - - - -	1st, 2d, 3d, 4th, 5th
Cockerels	- - - - -	1st, 2d, 3d, 4th, 5th
Hens	- - - - -	1st, 2d, 3d, 4th, 5th
Pullets	- - - - -	1st, 2d, 3d, 4th, 5th
Young Pens	- - - - -	1st, 2d, 3d, 4th, 5th
Old Pens	- - - - -	1st, 2d, 3d, 4th, 5th

30 Prizes Out of 30 Offered

Sweepstakes Championship Male and Female and Every Special Prize—every bird bred on my farm.

This amazing record is an exact duplicate of the Imperial "Ringlet" record of 1920 at Madison Square Garden.

These 100% Perfect Records are the crowning achievement of the unexampled "Ringlet" Records at New York for more than 30 victorious years.

The competition at this show was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

Supreme at Madison Square Garden Is Supreme Everywhere

FEED

1/2 AND 1/2

—to Help Your Hens Over the Moulting Season

Now is the time to prepare your hens for big egg production during the Fall and Winter months. Don't let your hens linger along for 4 to 6 months moulting. Get them through the moult **QUICK** because a moulting hen is an **EXPENSE** instead of a producer. Every day counts and the feeding methods you employ **NOW** determines the profits biddy will produce for you later on.

Try the FUL-O-PEP Way

The best known feeding method during the moulting season is one-half **FUL-O-PEP DRY MASH** and one-half **FUL-O-PEP GROWING MASH**—keep it before your hens all the time and you'll be agreeably surprised how quickly they will finish moulting and be back on the nests shelling out the eggs in large numbers.

FUL-O-PEP

POULTRY FEEDS

enable poultry raisers to get results from poultry that at one time were considered impossible. **FUL-O-PEP GROWING MASH** for growing birds enables you to produce big, healthy early laying pullets at less cost than any feed known. Keep it before the growing stock all the time—don't stop feeding it until pullets are 6 months old. Then feed **FUL-O-PEP DRY MASH**, the feed that makes your hens lay in Winter as well as Summer. These feeds have opened the door of opportunity to poultry raisers. Poultrymen everywhere are getting the results that these guaranteed Poultry Feeds produce—if you are not, why not? Get **FUL-O-PEP DRY MASH** for laying hens—**FUL-O-PEP GROWING MASH** for growing chicks. Make **FUL-O-PEP POULTRY FEEDS** your motto and your success with poultry is assured.

This Ful-O-Pep 4-qt. Self-feeder—
absolutely non-wasting. Sent
postpaid to all Ful -O-Pep
users on receipt of \$1.00

FREE POULTRY BOOK

Our new 1921 Poultry Calendar contains information and advice for poultry raisers that is invaluable. It is written by a leading poultry expert in a simple, easy to understand way. Even though you have never had experience with poultry, this book will enable you to be successful from the start—if you are an experienced poultry raiser, you will find advice in this book that you can profit by. This book is considered by those who know as the best book of its kind ever published. Contains pages for poultry, egg record and daily accounts sheets.

Grand Summer Bargain Sale

"Aristocrat" Barred Rocks

The World's Greatest Strain of Poultry

**The
Great
Money Makers**

Supreme as

—Showbirds

Supreme as

—Layers

Supreme as

—Market Fowl

AS SHOWBIRDS

The famous Aristocrat Barred Rocks have created a new WORLD'S RECORD by their sensational sweep of victories in thousands of showrooms, including the largest and biggest Barred Rock shows of the entire world. The NATIONAL B. R. CLUB SHOW (the greatest of all the great ones) CHICAGO, "HEART-OF-AMERICA," BOSTON, N. Y. PALACE, GUELPH, DALLAS, LOS ANGELES, "TRI-STATE," BROOKLYN, CLEVELAND, NEW ORLEANS, ST. LOUIS, WINNIPEG, PITTSBURGH, INDIANAPOLIS, MINNEAPOLIS, SAN FRANCISCO, DETROIT, etc., etc., hail the Aristocrats as winners! MY CUSTOMERS ARE WINNING OUT WITH "ARISTOCRATS" ALL OVER THE WORLD.

AS LAYERS

The same magnificent showbirds are equally supreme as layers. THREE HUNDRED SIXTY-ONE (361) EGGS FROM ONE MOULT TO THE NEXT BY AN "ARISTOCRAT" HEN IS UNDOUBTEDLY THE LAYING RECORD OF THE WORLD. Equally matchless is the record of 260 eggs in 270 consecutive days by another "Aristocrat" hen. Many "Aristocrat" cockerels from my great laying record hens have been sold to State Agricultural Colleges. (Only yesterday I received a report from one of these colleges giving a record of 79 eggs in 79 days.) Can better evidence of their value be given?—From all over the civilized world "Aristocrat" customers are sending in glowing reports and laying records.

THE IDEAL MONEY-MAKING COMBINATION

EVERY WISE, PRUDENT BREEDER WILL DO WELL RIGHT NOW TO LOOK FOR THE GREATEST MONEY-MAKING COMBINATION IN POULTRY THAT HE CAN POSSIBLY GET. Let every breeder who reads this give some serious thought to this vital subject—WHY NOT BREED THE GREATEST SHOW-BIRDS, THE GREATEST LAYERS, THE GREATEST MARKET FOWL—ALL COMBINED IN ONE? This is the combination which will give you MORE profit, MORE honor, MORE pleasure, MORE satisfaction than any other. This you get in "Aristocrats."

GREAT BARGAINS RIGHT NOW

Send for my Summer Bargain List. Investigate it. Study it. It will appeal to you as so sensible, so logical, so self-evident, that you will be glad that you sent. NO MATTER WHAT BREED YOU MAY HAVE NOW—SEND FOR IT ANYWAY. You can really save Big Money if you have this list handy.

W. D. Holterman, Fancier, Box A, Fort Wayne, Indiana, U. S. A.

INDEX TO GUARANTEED ADVERTISERS

The guarantee of James W. Bell & Co. is back of every advertisement and every advertiser in American Poultry Journal. We will not knowingly accept advertising from a dishonest concern. Advertisements for patent medicines or mining schemes, or any other questionable advertising, are not accepted under any conditions. We will not knowingly introduce a dishonest advertiser into the home of one of our subscribers. We refuse many thousands of dollars' worth of advertising during the year because we are not willing to guarantee these advertisers to our subscribers. When answering advertisements mention American Poultry Journal and refer to this guarantee.

BYERS' ORPINGTONS

Regarding State Fair Winners:-

I have them. Surely the very best in the land. Every specimen carries the richest First Prize, Chicago Coliseum Winning blood. All bred from my model Champion Exhibition Matings. It is my business to own and supply YOU with the particular quality that you must have to win and succeed. I started by showing and winning at State Fairs. As a result I did business. You can do likewise. Lack of quality will spell defeat. Show the quality and it spells success. The first cost of superior quality is forgotten when the results are observed.

You must have big, early hatched Cockerels and Pullets beautifully finished in plumage to win at State Fairs. Many of my Champion Exhibition bred Cockerels now weigh 7 pounds and Pullets 6 pounds.

And you cannot win with rough and ragged adult birds. They must be in as bright new plumage as possible and otherwise properly conditioned and fitted to display their quality and exhibition excellence.

Based on usual Orpington competition I have divided the several states into two classes and set the quality and prices necessary to win, as follows:

CLASS NO. 1. The State Fairs or Exhibitions in the States of New York, Pennsylvania, Maryland, Georgia, Tennessee, Indiana, Ohio, Michigan, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Texas, Colorado, Nebraska, Kansas, California and the exhibitions in the Province of Ontario, Canada. **PRICES.** Cock, \$50; Hen \$25; Cockerel, \$50; Pullet, \$25; Young Pen, \$125; Adult Pen, \$125.

If you require the above complete line to fill all classes to consist of Cock, Hen, Cockerel, Pullet, Young Pen and Adult Pen (14 birds total) the price is \$350.00.

CLASS NO. 2. All State Fairs or Exhibitions in the United States and Provincial Fairs in all Provinces of Canada NOT NAMED in Class No. 1. **PRICES:** Just half the individual or collective price named for exhibition birds listed under Class No. 1.

I furnished 182 First Prize State Fair Winners last Fall. Will far exceed that record this Fall. Be on time with your State Fair entry and your order. Wire if necessary. Deposit of half the purchase price necessary on advance orders. Depend on it that the cheapest possible way to get the highest possible quality is to buy where the real quality is found and delivered.

KEIPPER COOPING CO. Inc. (Eastern Office Johnstown, N. Y.) 1401 1st St., MILWAUKEE, WIS.

COCKERELS

Both White Wyandotte and White Leghorn cockerels for sale. Ten weeks old and up. From heavy laying trap-nested stock. Healthy, vigorous birds at surprisingly low prices. Also, males from our exhibition strain.

DR. B. H. MANSEL, Box 202, Quakertown, Pa.

COCKERELS

Mayslake Farm Buff Orpingtons

are one of the oldest winning strains in America. Exhibition cockerels and pullets, early hatched and ready for immediate shows, at reasonable prices. Approval, also, yearling stock.

FRANK F. CONWAY, Manager Poultry Dept., Hinsdale, Ill.

Harold Tompkins' Rhode Island Reds

Exceptional bargains in choice breeding birds from my best blood lines to carry over as breeders or as show birds. Place your order at once, to insure delivery. July delivery only.

Owen Farms

S. C. RHODE ISLAND REDS
and BUFF ORPINGTONS

Stand Pre-eminent

Their record as the foundation blood for other good flocks all over the World. Their show record in my hands or those of customers of Owen Farms at large and small shows all over this country and abroad. Their individual egg records in trap-nests and flock records as layers wherever they have gone. Their prepotency, stamina and vigor; and their ability to make good for their owners, have all been factors in establishing their supremacy.

The permanency of Owen Farms' business has been assured by the genuine values given, and the "Golden Rule" treatment accorded to every customer. This is the reason that many hundred orders come back each year from old customers, and why "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism.

1921 Youngsters

are rounding into form very rapidly. You will find here fine husky, perfectly grown January hatch cockerels and pullets in prime shape for August and September Shows. Fully finished pullets and cockerels almost in full feather. Good show cockerels and pullets at \$15.00 and \$25.00 each. Extra good cockerels at \$35.00; \$50.00 and \$75.00 each and pullets at \$35.00 each. A few wonderful birds for the hottest shows a matter of correspondence.

Selected utility cockerels at \$7.50 and \$10.00 each, with a discount on five or more and pullets at \$4.00 and \$5.00 each. These fine early breeders will not last long. Better order now.

Half Price Adult Breeder Sale

has gone nicely, as usual. You can still find the exact birds you need for next year at one-half their value May first. Take advantage of this summer sale and secure tested breeders for next year. Customers of other years have already had their orders filled.

Owen Farms Service

will mean a lot to you if you will use it. Your requirements will be carefully considered and I will select every bird that goes to you as close to your specifications as possible. A complete record is kept here of every shipment and you can secure just the proper birds from time to time to carry on your breeding. Come here to Owen Farms, if you can. Will talk to you on paper exactly as I would were you sitting beside me at my desk. Tell me your problems and let me help solve them. If you will tell me frankly just what you need and what you can afford to pay, my reply will frankly tell you exactly what to expect. My long experience is at your disposal and will be freely used for your benefit. Write today and find just what it will mean to you to have help from Owen Farms.

Practical Experience On Summer Care

The Most Vigorous Fowls Are the Most Active and Suffer Most in Hot Weather—
Necessity of Ventilation in Roosting Quarters—Shade and Fresh Water Required—Feed Milk to Young Stock.
By M. L. Chapman

DID you ever actually know a fowl to freeze to death? I have been raising chickens for over 30 years and in a pretty cold country part of the time, but I have never personally known of a fowl freezing to death although I have known them to roost out all winter in open sheds or trees where the thermometer went very low. But, did you ever know of any birds to die from heat? I have known of hundreds. Probably everyone that has kept chickens to any extent has had annual losses during the hot waves. In the egg laying contests I think the hot spells take off more birds than all other causes put together.

When anybody starts to build a hen house, the first thing considered is how to keep the birds warm. This is an important consideration, but it is more important to consider how the house can be designed so that it can be adjusted to keep the birds cool during the torrid waves of summer, that they may neither succumb to the heat or become debilitated as a result of excessive heat.

Protecting the Birds from Heat.

For the first two or three days after a real hot spell every summer, I get telephone messages about as follows: "Mr. Chapman, have you heard about the peculiar disease that is killing everyone's chickens?" I say: "No, I haven't heard anything about it. We haven't lost any here at Wilburtha except maybe a death now and then, but nothing to speak of."

"Well, it's very funny. Up around here everybody is losing chickens by the dozens. Some say it is cholera." Then they go ahead and describe varying symptoms and want to know if I can recommend a cure. After a few inquiries I usually can.

I ask how many birds they have and how much house room and ventilation is provided. Many times I find that 50 to 100 birds are roosting in a house 10 by 10 feet, or possibly 10 by 12 feet, with perhaps only one small window in the poultry house. In such a case, I ask the owner if he has a crow-bar on the place, and if he replies in the affirmative, I tell him to take the crow-bar firmly between the right and left hands and pry off the boards on two sides of his hen house, saving them carefully to be replaced in the winter; and give the whole house a good sousing of kerosene oil, provide plenty of cool water easily accessible in shady spots for his fowls to drink, and if there is no shade that the birds can conveniently get to during the day, to improvise some shelter for them by erecting four posts and making a roof of boughs.

This information does not generally make much of a hit with the owner because it means work. He would

much prefer to have me prescribe some concoction that he could have filled at the local drug store for a quarter, that would fix up his hens and make them so happy that they would go out to the fields, fly up on a Canadian thistle, sing like a canary bird, and then start in to lay like a slot machine. But one disadvantage of such a remedy is that it can be secured long before the weather will probably change, and the weak birds will have already been eliminated, so that deaths have naturally stopped before treatment can be started. Perhaps it is just along these lines that many remarkable cures are made.

Care of the Young Stock.

Young stock especially needs protection from the heat. July and August are the months when the direct rays of the sun during the hot spells are almost fatal to them. If you have chicks in a brooder house, you must improvise some sort of shade. Here at Wilburtha Farms we have yards for each brooder section surrounded by fence about four feet high. We simply run a strip of burlap bagging across the whole lot of yards. Also if you have dry weather, wet down the yards every evening with a hose or sprinkling pot. Bury oats two or three inches deep every few days to keep something green growing up for the chicks to dig at. Keep plenty of cool water in several places in the yards where the birds can have ready access to it.

Most of our young stock is on free range in colony houses 10 by 10 feet. These houses in addition to having practically an open front are also open on each side, generally a door on one side and a window on the other. When the first hot spell comes we take a board off the back, right up under the eaves, which allows a circulation of air, but prevents wind and rain cannot penetrate into the house to any serious extent. We carry on the average of 50 birds in each of these houses, and under such conditions we have practically no losses. All our old birds are also kept in the same style houses with yards about 40 by 75 feet to each breeding pen. All these yards have two peach trees; and all our young stock on range has access to running water and there are hundreds of peach trees for shade.

Under these ideal conditions we lose very few birds. Of course now and then an old bird getting along in years will die during the hot weather. Many times these are very vigorous birds. A year ago last summer we lost the first White Rock cockerel at the Garden, 1918. This old bird did not have sense enough to take a rest during the hot weather, but no matter how hot it was would insist on prancing around the yard a bit and (Continued on page 777)

Molting Old Plumage and Growing the New

Growing Chickens Are Continually Producing New Plumage—The Annual Summer Molt—Value of the Molt in Culling Practice—Beauty of the New Plumage Depends on Feeding and Condition.

By F. L. Platt

YOUNG chickens grow about three sets of plumage during their first year of development from spring to fall. The feather growth begins as soon as the baby chick comes out of the shell, if not before, and continues until the adult plumage is mature. The first feathers appear in the wing, and look like flight feathers, but before long the chick begins to grow its real flight feathers, and those first little feathers, which may have appeared to be badly offcolored, are found on the side of the wing as little, insignificant, old feathers about to be molted out.

Growth of the body seems to necessitate a constant production of feathers, and each set of new feathers is firmer and has a more durable webbing. The first set is quite flimsy, and the feathers on the cockerels are shaped and colored like those of the pullets. With the next crop, the character of the cockerels' feathers changes; and upon examination it is found that the cockerels are growing long pointed feathers on their back. The development of the reproductive organs seems to influence this change.

Distinguish Cockerels by Their Plumage.

When a poultry raiser is unable to tell whether a chick is a cockerel or a pullet, because of undeveloped head parts, let him pick up the chick and if narrow, pointed feathers, which are characteristic of a cock's saddle, are coming out on the back, the bird is a cockerel. I have never known this test to fail.

It is sometimes difficult to tell when the one set of feathers is complete and another growth started, for there seems to be a constant shedding and growing of feathers in young birds; but after the characteristic male plumage begins to develop, the cockerels of many varieties soon take on a very different color than their sister pullets, and never again in these breeds in which there is a striking difference in the color and markings of the male and female, will the males be colored like the pullets. For this reason, some breeders of penciled varieties, like Silver Penciled Wyandottes and Partridge Rocks, and stippled varieties, like Brown Leghorns and Silver Gray Dorkings—mark those little chick-feathered cockerels that have the best pullet markings, and then the following year they breed these males for the production of beautifully colored pullets. W. Theo. Wittman was the first man to my knowledge to practice this kind of selection in pullet-breeding males, and he defeated all competition in Brown Leghorn females at the New York Show for several years; and then in three years built up the greatest flock of Silver Penciled Plymouth Rocks in America, to sell them out to a visitor who, being so impressed with the great uniformity and high excellence of the flock, purchased it entire.

Buff Wyandotte hen in old feather, just before the process of molting. The old feathers are faded in color.

A White Leghorn hen of good vigor, heavy in molt. This hen is shedding rapidly and is in a complete pin-feathery state.

Forecasting the Color of a Bird by New Plumage Just Starting.

In culling young birds for color, always look at the new crop that is growing underneath, and judge them by it, rather than by old feathers that appear on the surface and which will soon be supplanted by the new. It will be found that a Rhode Island Red cockerel which has a light colored hackle will not show much improvement with age; but a Brown Leghorn cockerel that shows red in his breast will usually change into a pure black-breasted bird; or a Light Brahma pullet that has black ticking in her back may clear up after she is six months of age. If the new breeder is not crowded for room, he should grow practically all of his chicks the first year, that he may become familiar with the way they feather out and color up.

Young birds are not the only ones that change. A penciled pullet after laying through the spring and molting in the summer, usually comes out as a better penciled hen; and this mature molt, which comes at the end of the first year of laying to transform pullets into hens, may change an open laced pullet into a mossy backed hen. It is because of this uncertainty that many breeders prefer to mate hens for the production of hatching eggs. Hens have lived long enough for defects of color and markings to have asserted themselves. By this advanced selection

the different varieties of domestic fowl are being purified for color and markings, and the number of good specimens in a hatch is today greater than formerly.

It is desirable that chickens as well as older fowls that are growing plumage should receive good care and nourishing food. The growing of plumage is a drain on the body. Under damp or crowded conditions, or as a result of poor feeding, a Brown Leghorn cockerel or hen may molt in white in their wing feathers. White is a serious defect that may appear in all colored varieties and is as often the result of faulty condition as of poor breeding.

The Molt Is an Indication of Egg Yield.

The length of time required to molt is shorter in cocks and hens of high vigor. This question of length of molt is of importance because females do not lay many eggs during the time that they are shedding and growing plumage. The average time required for a complete molt is 90 to 100 days.

The molt is considered as one of the best outward signs of egg production. When a female carries her old plumage late in the season, it is a good (Continued on page 782)

Summer Care of Young and Old Flocks

Chicks Should Be Reared With that Watchfulness and Kindliness Which Is Conducive to Thrift, Contentment and Tameness—Cull Both the Young and Old Flocks at This Season—How to Combat Parasites.

By E. H. Hoffman

THE summer months are an important period for the poultry fancier because during this time the success or failure of the entire work of breeding and hatching will be determined. The chicks are now growing and unless every possible detail is given attention the entire flock of youngsters may be a failure. At this time, moreover, the breeding stock has finished performing its duty, and the birds which have been laying heavily should have special care so that they will molt out satisfactory before cold weather sets in.

So many little things figure in the summer's work in the poultry yard that one has no time to waste, but must be constantly on the job. Too many persons, who aspire to be successful fanciers, are very apt to neglect their duties and then wonder, after the summer is over, why their chicks did not develop into large, sturdy birds fit to win in the shows in competition with those of other breeders who gave their flock the required attention from the time the chicks left the shell until they were fully developed and ready to go into the show room. Unless a fancier takes an interest in his work every day in the year and really enjoys the work he will not succeed in fullest measure.

I have often had people ask me, when they saw me during my spare hours working about the poultry houses: "What fun do you find in that? I should think you would rather be out fishing, hunting, automobile riding or something that gives you some recreation and pleasure." I have often wondered if those people realize what pleasure a real poultry fancier derives from his fowls and how he enjoys watching the little fellows grow and sprout new feathers until they are fit to show? There is something very fascinating about the work for me and I know there is for the many others who are often termed "chicken cranks." They are those who can always see something to do in the poultry yard, and they are making a success of the business.

After the hatching season is over and the yards are full of little chicks there are so many things to do that one wonders how he ever can get through. We must always be on the fighting line against rats, cats, lice and mites and disease of every description. That requires well built and comfortable houses that are rat proof, with plenty of ventilation, and at the same time located where they are protected against the hot sun and other weather conditions.

Control the Parasites.

In every brood of chickens there are always some that do not seem to get along as rapidly as others, falling behind as it were, and in every case of this retarded growth there is a reason and we should ascertain what cause is arresting the development of the chicks. Sometimes it is due to lack of vitality; again, it may be due to lice or other hurtful influences.

Many people see their chicks standing around lifelessly and wonder what ails them, never thinking that lice may be doing the mischief. The head louse probably stunts more chicks than anything else, and it is surprising how few people guard against them. When a little chick does not grow as rapidly as the rest in the breed it is advisable to look for these pests. The lice are not found altogether on the top of the head, as many folks suppose, but also are found down the neck and under the throat. Sometimes dozens of them can be found on a single chick.

To prevent these lice is an easy matter but it is a mistake to wait until the chicks are half dead before a remedy is applied. Pure melted lard rubbed on top of the head

and all around the neck will do the work. Head lice are usually found on chicks that are brooded by hens and the greasing should be done in the evening. The next morning the little fellows may appear to be covered with grease and for a few days look dirty and unsightly, but never mind that. The lice have disappeared and in a few days a great change will be noticed in the activity of the chicks.

As the chicks grow larger and become feathered out there is less danger from head lice but then comes the possibility of body lice. These, too, are easily exterminated by dusting the chicks with commercial lice powder under the wings, on the neck and around the vent. It is surprising what a difference it makes to have the chicks free from lice and note the advancement made in their growth.

While all this is being done there is still another pest and that is the worst of all when it once gets a start. I refer to the small mites that infest the coops and which, if allowed to multiply, will kill young chicks and seriously weaken if not kill old ones. These mites often get started from setting hens and old nests in which hens have hatched their chicks. I have seen nest boxes that were allowed to stand around several weeks after the hatch that were literally covered with mites. They multiply so rapidly that in a short time the boxes are filled with mites a quarter of an inch in depth. To prevent mites it is best to burn all old straw used for setting hens immediately after the hatch, spray the coops several times during the summer with a strong coal-tar disinfectant or commercial lice paint and apply same to the roosts in the houses where the old fowls are kept. Every poultryman should have such a preparation on hand and use it.

Help Boost the Good Birds Along.

As stated above there are always a few chicks that are smaller and do not keep up with the rest of the brood. These will never develop into large strong birds and should be separated from the vigorous ones and shipped to market. Those that give promise of making the best breeders and show birds should be given special attention during the summer months. Never keep too many growing youngsters in one colony house, especially at night. Overcrowding at night is dangerous, causing deformity and disease. Where a large number of growing chicks are allowed to run together during the day they will invariably crowd into one colony house at night. It is well that they be divided into smaller units and then got on the roost reasonably early to avoid the habit of piling on one another. Smaller units are also an advantage at feeding time when the weaker ones in a large flock are very apt to be trampled upon and not allowed to get their share of the food.

From time to time in summer and fall the more promising chicks must be separated from the others and given special care because they are the ones that will make the show birds. Should any of the chicks develop defects, such as crooked backs, wry tails, poor combs, etc., they should be sent to market. It never pays to crowd promising birds on account of others that show these defects. To develop the choicest birds into show specimens requires more than wholesome food, fresh water, cleanliness and plenty of room. They must be reared with that watchfulness and kindliness that is conducive to thrift, contentment, tameness; and this requires not merely throwing a portion of feed to them but thoughtfully spending a little time with them. A bird (Continued on page 778)

Dual Purpose Breeds Are Most Popular

Of the Farm Flocks in Missouri Only 20% are Mongrels—Purebred Flocks of the Dual Purpose Breeds Comprise 58%—Leghorns Represent 17% and Gaining—A Discussion of Which Is the Best Breed.

T. S. Townsley

THE farm poultry yard is the great testing ground where Nature's law of the survival of the fittest comes into full play in testing out the worthwhile qualities of the numerous varieties of chickens and deciding which of the breeds shall endure and which ones shall pass into oblivion.

The ultimate dominant breed of chickens, if any one breed shall finally triumph over its competitors, will be the breed which combines those qualities which make it best suited to the conditions on the general farms where 95 percent of the poultry products are produced.

That the law of selection is working constantly is shown by the fact that, although more than a hundred varieties of chickens are listed as standard, only seven varieties of five breeds are found in sufficient numbers on farms to render them commercially important. Although a considerable percentage of the farm flocks are of mongrel breeding, they are being rapidly replaced by Standardbred birds, indicating that the latter are superior in economic qualities to the birds of uncertain origin.

Dual-Purpose Type vs. the Egg Type.

A questionnaire circulated among 5,000 of the leading farm poultry keepers in Missouri brought forth the information that 30 percent of these farms kept Plymouth Rocks, 19 percent Rhode Island Reds, 17 percent Leghorns, 7 percent Wyandottes, about 2 percent Orpingtons, and 5 percent miscellaneous standard breeds with no one breed showing in sufficient numbers to represent one percent of the total, while only 20 percent of these farms kept mongrel fowls. Although the breeds would range in various order in different states, and in some sections the percent of mongrel flocks would be much higher, it is probable that the five breeds most commonly found in Missouri would make up a very large percent of the Standardbred birds on the farms in any state in the Union.

In only two of the popular breeds in Missouri is more than one variety found in any considerable number among the farm flocks. In the Plymouth Rocks, the Barred variety is an overwhelming favorite although the Whites occur frequently enough to entitle them to mention as having commercial rank. In the Leghorns, the Single comb White variety is the most popular although single comb Browns are found on numerous farms. In the Wyandotte breed only the White variety has gained much popularity among farmers, while the single comb Rhode Island Reds and the Buff Orpingtons are the outstanding varieties in those two breeds.

Some of the newer varieties such as single comb Anconas and single comb Rhode Island Whites are beginning to attract the attention of farm poultry keepers and may in time take their place as leading breeds. On the other hand, some of the varieties which were once popular on farms, such as Black Langshans, have lost their place and have been supplanted by other types.

In spite of the relatively small number of breeds which predominate among farm flocks, the question of what breed or what type is best adapted to farm conditions is by no means settled. Hundreds of farmers are asking which is the best breed for the farm and a great many changes are being made by farm poultry keepers in an effort to find the one ultimate farm breed.

Just at present the question which is occupying most prominence in the minds of the farm poultry keepers with regard to the kind of birds to keep is not so much a question of breed as it is of type. The dual-purpose breeds, such as Plymouth Rocks, Wyandottes, Rhode

Island Reds, and Orpingtons, have been the predominant types found on farms, but within recent years the egg type bird, represented particularly by the Leghorn breed, has been gaining in popularity among farm poultry keepers, and the big question today among farm people who are seeking the ultimate hen is a question not of whether they should choose Plymouth Rocks in preference to Rhode Island Reds, but rather whether they should choose one of the general purpose breeds or should choose Leghorns.

Much can be said in favor of both the egg type and the general purpose type as the logical choice for the farm poultry keeper where his fowls will be a side line more or less subordinated to other undertakings. The controversy as to whether a general purpose breed or an egg breed will prove most profitable on general farms can be answered definitely by time alone, and it is the purpose of this article to point out some of the arguments on both sides.

The big argument advanced in favor of the dual breeds is that they are far superior to the egg type breeds in meat qualities, and the claim is advanced that whatever superiority the egg type birds may have as efficient egg producers that is more than offset by the extra price realized from dual-purpose fowls when the birds are sold. The argument is also advanced that dual-purpose breeds are needed on many farms to hatch and brood chicks where equipment for artificial hatching and brooding is not available.

Most of the Poultry Packers take a very emphatic stand in declaring that the dual-purpose breeds are best suited for the farm and that Leghorns ought to be banished. They point out the fact that a dual-purpose hen often weighs twice as much as a Leghorn and claim that this extra size means extra profit when the birds are sold. The Packers also often advance the claim that Leghorn eggs are smaller than eggs from dual-purpose fowls and say that when eggs are sold by weight the latter will be more profitable. This last criticism is unfounded where well bred Leghorns are concerned because the modern egg type Leghorn lays an egg which weighs a full twenty-four ounces to the dozen and is the standard egg in the most discriminating markets.

Advantages Possessed by Leghorns.

Those who favor the Leghorn breeds for the farm claim that the Packer has a prejudiced viewpoint with regard to the meat qualities of the different types and that he is thinking more of his own profits than of the profits of the farmers when he advocates keeping the heavier breeds. They point out that chickens are the only animals which Packers find it profitable to fatten after they come in from the farm, indicating that the business of making fine milk-fed roasters out of the lean Plymouth Rock cockerels which come in in the fall probably returns the Packer a handsome profit.

Leghorn partisans claim that under normal conditions broilers and roasters are produced at no particular profit to the farmer while the egg production from well managed flocks always shows a reasonable margin of profit. They point out, further, that the seven-pound Barred Rock hen probably cost twice as much to grow as did the three and a half or four-pound Leghorn, that she was at least a month longer in coming into laying, that her profitable laying period is at least a year shorter than for the Leghorns, and that she eats more pounds of feed for each dozen eggs produced. Phillips of the Purdue Experiment Station showed in an experiment (Continued on page 777)

GROWING SUPERIOR YOUNG STOCK

The Fancier and His Work—Feeding and Selecting the Young Birds—
Importance of Culling Out All Weak and Undersized Specimens—Do
Not Cull for Color Too Early.

By Rev. T. W. Harwood

DURING the week of a poultry show in a New England city, a party of fanciers were greeted at the hotel by a lawyer acquaintance. "Hello," said he, "some more poultrymen! Last week it was all horsemen, but I must confess the poultrymen are the better crowd." The confession was the more significant, as the lawyer was himself a trotting-horse enthusiast.

It is quite noticeable that poultry fanciers are a superior class of men. The reason for this superiority is not far to seek. A mean man may take up poultry, but he seldom becomes a fancier. The fancier is pre-eminently a lover of the beautiful. Types, colors and forms of beauty are in his mind and, in obedience to his creative instinct, he is working to produce them. He is under the uplifting spell of creative art and naturally he grows with his work. The trouble with the horse business is that the interest centers largely in a horse's speed performance and the speed craze attracts to the horse fraternity crowds of men who are sports, pure and simple.

This matter of the fancier, of what constitutes a true fancier, of the services he renders to the poultry industry, and what truly great men may be numbered among poultry fanciers, could be made a fascinating subject for a separate article. The aim of this article is to encourage and help the many beginners in poultry who are fanciers in embryo.

The number of fanciers among poultry keepers is far too small. No effort should be spared by the older fanciers to assist and encourage beginners. It is with this in view that the following hints are offered.

Care of the Young Stock.

This has been an exceptional season for early birds and you doubtless have some young stock of your favorite breed well started.

"What do you feed?" is the question that always seems to come first. Much that you may have read about balanced rations is useful to the large-scale, egg-farm man, but less important to the fancier who is trying to raise a few good ones. To him I suggest that he give some mixed grain twice a day, as much as the growing birds will eat without leaving much lying around. A growing mash should be fed dry in a hopper. And milk, either sour, skim-milk or buttermilk, is the secret of growing the finest chickens, as it is with every other domestic animal. The young stock need a run in which grass or other green stuff never fails, and they need shade; but don't forget the milk.

I once exhibited some April-hatched birds at the Brockton (Mass.) Fair, in early October, that were feathered and developed beyond those of all competitors, and I won the ribbons and my birds sold well. How was it done? A creamery man across the way gave me all the buttermilk I wanted. During their first three weeks those chicks had nothing else to drink. After that they had access to water, but milk was with them from start to finish. At five weeks old I put them

in some Essex rape, which gave them all the shade and green food they wanted. It was fun to see them grow.

Some, to whom I talk milk, speak of the expense or difficulty of getting it. Since buttermilk has become a fashionable drink, it is often higher priced than skim milk. The latter can usually be obtained at a sufficient low price. Anyway, get milk by hook or crook and keep it with them all the time. Some good device for feeding sour milk still awaits an inventor. It won't run out of water fountains. If fed in open pans the chicks step in it and foul it. Some put a wire netting over an open dish. This helps somewhat. I use stoneware rabbit crocks. They are small, but several may be used, according to the size of the flock. Set them on bricks and keep them filled. The chicks will seldom step in them.

How about beef-scrap? you say. When good, it is excellent; though not quite equal to milk. When it is not good, you discover the fact by bowel trouble, which means stunted chickens; or by limberneck, which means dead chickens. If you stock is valuable, milk pays.

Wyandotte pullets raised in this way will lay when six months old. I have had them lay when a little over five months old. Such feeding is of course too fattening for adult fowls; but growing stock must be liberally fed.

In hot weather water soon becomes fetid. To avoid this some people scald and scrub the dishes every day. I adopt what may be considered a lazy man's trick. For a number of years I have practiced putting a trace of permanganate of potash, only enough to color the water a light pink, into the chicken's water. This keeps it sweet for two days. No ill effects have ever appeared from this.

Culling should begin early. Even when five weeks old, there may be one or two specimens so far behind the others that it is evident they will never attain more than half their proper size. Some say, keep them until they are: broiler size, then eat them. The objections to this are: Their retarded condition is sometimes due to disease. Anyway the fact that they are smallest and weakest makes them liable to disease and their presence is not good for the rest of the flock. They will be so slow becoming broilers that it is doubtful if they are worth their feed. They will never be really good broilers. They will spoil the looks of your flock for two or three months.

Cull Rigorously for Vigor.

The correct procedure is as follows: Go out tomorrow evening about dusk and dig a hole. When your wife is otherwise engaged, abstract her big shears from her work-basket. Then take your flashlight and pick out the little runts; snip off their heads and bury them. After carefully removing traces of the awful deed from the shears, replace them in the work-basket, go to bed and sleep soundly. They never will be missed.

That cross-billed specimen, male or female, should not be kept beyond the broiler age. Such a chicken invariably gets (Continued on page 780)

Silver Grey Dorkings, 3 months old June 10, 1921, when the cockerels averaged 3 lbs., 14 oz. each, and the pullets 3 lbs., 4 oz. each. White mottling in the breast of cockerels will disappear as the birds grow older. One of the most interesting observations of a fancier's year is this change and improvement in the coloration of his young birds, as they grow new plumage to meet the needs of an enlarging body. The pullets have a beautiful steel grey back and a robin red breast. Picture taken in yard of Mrs. Omer M. Taylor, Kansas.

Fields and Ranges Where Chicks Are Grown

Impressions Gathered from an Auto Trip Along the Feathered Trail of New Jersey—Essential Care of Growing Stock—Feed, Shade and Water Are Necessary to Grow Bone, Flesh and Feathers.

By Willard C. Thompson

THE pullets are in camp for the summer! Vacation? Not exactly! Work is the order from headquarters, and that means grow fast, develop quickly, and do not stop.

It is very interesting to drive along through pretty country roads in summer time, watching the various activities in the fields by the wayside, and especially, to a chicken man, is it an appealing picture to catch a glimpse of a shady range on which numberless thriving pullets are pushing on toward maturity. And again is the trip particularly pleasant as one's glance takes in such an alluring landscape as is made by the beautiful old Delaware River, not so far from Trenton, that city famous since Revolutionary days.

The auto stopped beneath the shade of some good old trees and allowed the party to look about a bit. On the right were the fields over which the pullets of Wilburtha Poultry Farms, Rhode Island Reds, White Plymouth Rocks, Leghorns and Black Giants, were ranging. A prolonged look over the flocks and their environs emphasized several important points that all poultry raisers might well seriously consider as the hot days of summer go by and their own pullets are leaving the chick stage to enter the business sphere of layers.

Object—Better Pullets.

The poultry raiser who does not see some advancement in the quality of his pullets each year is standing still in his work. Oftentimes this increase is not decidedly marked, but it should be there. Back of this greater efficiency of the layers must be inherent strength, power, and the capacity to produce eggs in large numbers. But, given a flock of well-bred youngsters it remains for the successful chicken man to carry them through the summer, their growing and developing period, in such a manner as will result in their reaching the mature state in condition to go ahead with economical "quality" production. A whole lot depends on how this summer work is done. It was very evident that the farm we stopped by the roadside to look at had found the key to the proper management of the growing birds. It was hardly necessary to ask any questions, for the plan was written right there before us.

Many chicks hatched out of their shells which never ought to take up room on the range. Probably the bulk of such weak chicks never live beyond the brooder days, and yet some do, and these are the ones which should be weeded out as the pullets and cockerels are moved from the heated brooder houses to the summer encampment of colony houses. Possibly they would make eatable broilers and thereby bring in a little revenue, but they never will yield profits at maturity. Therefore, this word about selecting with some degree of care the pullets that are to go on range. Health, vigorous and robust, size, uniform and sufficient for their age, and type that is promising should be points uppermost in one's mind as this step is accomplished. Summer camp, in the shape of roomy fields or ranges, should be available only to pullets that have the earmarks of being money makers for the poultryman.

Shade the Young Birds.

It is not a difficult thing to spoil a perfectly good flock of promising pullets, well-bred and finely selected, by failing to surround them with conditions that will develop them normally. This is as true when the pullet flock con-

sists of only a few birds as when it numbers its members by the hundreds or thousands. I presume that the first thing that attracted our attention there in that range so near the banks of the Delaware was the abundance of shade, practically all of which was furnished by Nature in the form of trees and lower growing bushes. As summer days arrive with many a hot and blistering sunshine, the growing pullets will seek protection from that heat.

The range, if it is to produce good pullets in the fall, must first of all be provided with shade. So much the better if Nature has put trees and shrubs in it. But get shade even if board shelters have to be erected, or corn or sunflowers planted. Access to cool spots will cut down on the death rate on the summer range, and it will enhance growth, to say nothing of the comfort afforded. The colony houses can best be placed in shady parts of the range, so that they will not be unduly hot at night, and, too, they will be used to some extent in day time. The man who is especially interested in raising exhibition stock finds further reason for shaded yards, as old Sol bleaches and fades colored plumages and tends to sunburn the white feathered coats.

Water for Growing Stock.

Hot weather sends the poultryman himself to the spring to get many a cool drink of water. His pullets get just as thirsty, and in fact, need water more than he does, for their bodies are enlarging, developing, and using great quantities of water. On that farm again! We saw a plentiful water supply placed in shady parts of the range where the pullets were congregated, and dozens of them were visiting the water troughs as we looked their way. This point in summer management was impressed upon us as not long before that trip we had stopped at another farm some miles away and there had found some fifteen hundred pullets on a bare and sunny range without a drop of water in the wooden troughs. And the owner had asked us why his pullets were not doing as well as they should. I guess he just didn't think, but one must think if he is to raise pullets worth the while. The Reds and their companions that we saw at Wilburtha did not suffer setbacks because they didn't have water, fresh water, and lots of it all the time. I don't suppose there is any one point in the care of summer pullets that is more apt to be neglected than the water supply, at least it seems that way at times. Clean water pans or troughs pay dividends. Running water, either in brook or from a slow faucet, is the least of bother where it is possible.

And Green Food.

We hear a lot these days about vitamins, elements that are to be found in milk, egg yolks, and green plants, and we realize that there are probably different kinds of vitamins that are needed for proper growth and development. It is wrong to think of these vitamins as something more or less scientific and not wholly necessary. There isn't a more practical thing for the poultry raiser to remember than that his methods must include some way of supplying his growing chicks with vitamins, call them what he will. And it helps a lot to know and remember that the green leafy parts of plants contain some of these vitamins that are especially essential during that period of the bird's life when the body is developing. And so this sort of explains why the best range is that which has growing on it some green crop, either permanent grass, alfalfa, clover or similar plants, or (Continued on page 778)

U. S. POULTRYMEN MAKE A NEW BREED

Harry M. Lamon, Senior Poultryman, U. S. Department of Agriculture Makes New Breed—A Dual-Purpose Type With Red Ear Lobes that Lays White Shelled Eggs—Named "Lamona" by Secy. Wallace in Honor of Mr. Lamon.

By F. L. Platt

HARRY M. LAMON, Senior Poultryman of the U. S. Department of Agriculture, started in 1912 to develop a new breed that would combine meat qualities with white egg production. It was his observation that in some sections of the country, particularly in the territory adjacent to New York City, some farmers were keeping White Leghorns simply because they laid white shelled eggs, for which the market of the Metropolis paid a premium, when in reality any one of the general purpose breeds would be better suited to their purpose, if they only laid a white egg.

With this thought in mind, Mr. Lamon started in to "make to order" a breed that would meet the requirements of these poultry keepers. The breed has progressed far enough so that its size, type, color of plumage, red lobes, and white egg characters are satisfactorily fixed.

The Federal Department of Agriculture "regards this work as a noteworthy achievement in breeding and, without solicitation on his part, has named the breed for the man who developed it."

The breed was officially recognized and the name "Lamona" adopting when the following recommendation was approved by the Secretary of Agri. H. C. Wallace, April 23, 1921:

U. S. Department
of Agriculture
Bureau of Animal
Industry

Washington, D. C.
April 21, 1921.

Dear Mr. Secretary:

I wish to suggest to you the determination of a name for the new breed of poultry which is being developed at the Beltsville farm. In a broad, general way the purpose of this project was to attempt to develop a white-plumaged, meat-producing breed of poultry which would lay a white-shelled egg. Thus far the breeds which lay white-shelled eggs are poor meat producers and in sections where commercial egg production has been developed it often happens that while there are plentiful supplies of eggs the supply of poultry meat is deficient. In order to have a distinguishing mark when compared with White Leghorns, it was decided to fix a red ear lobe. Most poultrymen believed this could not be done, as all breeds known with red ear lobes laid brown-shelled eggs. The work has now reached a point of development where the type is fairly definitely fixed.

Not only do we have now a strain of high value both for meat and egg production, but hens are being produced which are laying clear white-shelled eggs, although they have solid red ear lobes, which is quite a feat of skillful breeding.

We have not until now been able to suggest a suitable name for the breed. The word "American" has been suggested, but this is already used to designate a large class of poultry—the American class, which

includes the Plymouth Rocks, the Wyandottes and the Rhode Island Reds. We have chosen the name "Columbia" for the breed of sheep which is being developed at the U. S. Sheep Experiment Station, but this word can not be used for our new breed of poultry, as the word "Columbian" is already used for a variety of Wyandottes and Plymouth Rocks. The Bureau therefore suggests that the breed be named for the man who has developed it—Mr. Harry M. Lamon, Senior Poultryman in charge of Poultry Investigations. If Mr. Lamon were a pathologist, an entomologist, botanist or a naturalist, and discovered a new species of bacillus, insect, plant or animal, it would be quite the usual thing to name it for the discoverer. The development of a breed of domestic animals which promises to be highly useful is no less a contribution to science, industry and the general welfare than the discovery of a new species of micro-organism, plant or animal. The original idea of developing this breed was Mr. Lamon's and a project has been on file in the Department from the start of which he is designated as leader. Every mating has been made by him and he is entitled to all the credit for what has been done so far. In view of these circumstances I recommend that the breed be officially designated "Lamona."

Yours very truly,

(Signed) JNO. R. MOHLER, Chief of Bureau.

Good male and female type as carried by a pair of model specimens of Mr. Lamon's new breed "Lamona." Note the length and depth of body in the female which indicate large capacity for egg production.

In order to make the new breed, "Lamona," Mr. Lamon used the Silver Grey Dorking female at the right as a foundation. She was crossed on a White Plymouth Rock male. A Dorking female was also crossed on a White Leghorn male. These were the foundation crosses, made in 1912 and 1913.

The making of a new breed is a great accomplishment. A breed is more than a cross, more than a mere intermediate between two types; it is a family of which the members possess distinctive characters that are fixed so firmly that they may be transmitted with a satisfactory degree of regularity and uniformity.

The red lobe character has been the hardest for Mr. Lamon to fix. All of the existing breeds that lay white-shelled eggs have red ear lobes. All of the dual purpose breeds have red lobes and lay brown or tinted eggs. Mr. Lamon decided to establish red lobes as a breed character of the Lamona that this new white plumaged, single-combed, yellow-skinned

white-egg race might be readily distinguished from the Single Comb White Leghorn. Many poultrymen pointed out to him that there appeared to be a reciprocal relation almost like an interdependence of functions between red lobes and brown eggs and that it was doubtful if a white egg strain of red lobed fowls could be produced. He always replied to such statements: "Perhaps it cannot be done, but I shall try."

He has now succeeded in producing a number of females that have red ears and lay white-shelled eggs, although progress in segregating this pair of characters has been slow and difficult, and at the present time the characters are not fully dependable from a (Continued on page 783)

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

Price Levels Favor the Poultryman

If we take the five-year period just before the war and let an average of all the prices for all commodities represent the normal, or 100%, we will find that today the average price of all commodities is one-third higher, or 150%.

The price of corn and oats is below this 150% level. Corn is 108% and oats 110%. Some commodities are lower in price today than they were before the war. Copper is 90%, wool 95%, potatoes 57% and cotton 54%.

The poultryman is in good shape. Eggs are 153 percent and chickens are 206 percent. This means that the purchasing power of the poultryman is up.

The wool man finds that the average price of all commodities is 150 percent, while the price of wool is 95 percent, so he has a low purchasing power when he sells his wool and spends the money in the purchase of other things. The farmer who grows corn and oats finds that his grain has a price level of about 110 against a general price level of 150, which means that when this grain farmer puts his corn into dollars and then spends the dollars for the necessities of life, the odds are against him, for he has a purchasing power of \$1.10 on \$1.50 which is equivalent to 73 cents on the dollar.

The poultryman has a purchasing power that should make the grain farmer, wool grower, potato grower and cotton planter wish that they had more chickens. When the poultryman with a price level of 153 on eggs and 206 on chickens, puts the buying power of his products against the average price of 150 for all the necessities of life, he gets the best of the bargain. On top of this, he is especially favored when he puts the purchasing power of eggs at 153 and chickens at 206 into corn at 108, oats at 110 and bran at 114.

It would be hard to conceive of an industry in which the price level is more favorable. The raw material which the poultryman uses, corn, oats and wheat bran, is selling at a level below the average; and the poultryman not only

raises the purchasing power of his corn and oats by transforming them into eggs and chickens; but he again has an advantage when he turns his poultry products into dollars and puts the purchasing power of those dollars against the average price of all the necessities of life.

What of the future price level? There never was a time in the recollection of the present generation when people discussed possible future trade developments as they do today. Business men and producers of all kinds are giving much thought to such matters as probable supply and likely demand, of costs of raw material, wages and prices; and there is a new found interest in economics, that science which treats of wealth, prices and the basic laws which govern trade.

All economists do not participate in the feeling that because the average price level has now descended to 150, we are going back to the pre-war basis of 100 swiftly and immediately. Prof. F. A. Pearson recently laid before us a large number of charts on the price movements of a great many different commodities. Then he said:

You will notice in these charts that the lines which mark the rise and fall in prices, as they run over a series of years, may go down abruptly at times, but when these price-level lines strike bottom, they do not stay there, but rise again. They rebound like a rubber ball that has been dropped on the pavement. Do not forget that.

We have struck the bottom of the present decline. There probably will be some further declines in retail prices and possibly some declines in steel, but the next six months will see the average price level of all commodities rebounding upward. The ball has struck and you are going to see it bounce up somewhat.

There are many who agree with Professor Pearson, saying that "the bottom has been reached" and "the corner has been turned." They do not forecast a boom such as that which was stimulated by war expenditures. That would be as unreasonable as is the view that a great nation which spans the North American continent from the Atlantic to the Pacific, with varied and vast resources, peopled by a hundred million Americans of intelligence, who have willingness to work and desire to produce, is to see its industry and agriculture slow down to the point of stagnation.

Conditioning and Judging Saddles

The back is the most important section of the body in giving type and breed character to a specimen. Could you conceive of a moderately short, slightly convex Wyandotte back on a typical Rhode Island Red hen, or a comparatively narrow Leghorn back, with concave sweep to tail, on a high class Minorca pullet? Though a female be perfect in all other respects, a faulty back will spoil her.

Important as back is in the female of the species, it is even more important in the male. Out of the male's back grow the long saddle hangers. It is these saddle feathers that distinguish the male from the female and make of him a "rooster." Put hen feathering on the back of the male and you transform the entire appearance of the bird.

It is obvious, therefore, that breeders should seek to breed males with well modeled backs, that they should try to produce abundance of saddle covering that lays properly and fills the span from neck to tail in harmonious and symmetrical style. It is natural that in washing and fitting their birds, they should endeavor to get all the soap out of the back plumage that the feathers may lay out naturally. Moreover, it is not surprising that a few enterprising conditioners should have attempted to secure width of back, and thereby emphasize and elaborate the section, by bending backward the quills of the saddle feathers.

Several males conditioned in this way have been seen in the White Leghorn classes at leading eastern shows the past few years, and they are made the basis of the following communication from M. L. Chapman, president of the National Single Comb White Leghorn Club:

I do not feel that the White Leghorn breeders of America should let the question of breaking back saddle feathers in cocks and cockerels pass without some comment. My attention was first called to this sort of fitting at the New York Show of 1919. I remember remarking to Mr. Platt at the Boston Show the following year, when he asked me how I liked the back on a certain male, that our superintendent, Fred Smith, would not condition birds that way and I did not want him to condition our birds that way.

I did not think very much about it at the time, however, as that was about the beginning of the modeling of saddles. It seemed to me that in spite of the fact that it made the birds appear a little broader, it also made their backs look loose, fluffy and Cochiny, and this was sufficient to defeat the practice.

New practices and new methods are constantly being developed among all progressive classes of breeders. When poultrymen cease trying new things, it will be time to ask for more new blood in their ranks. Of this ever striving to do new things, or to do old things in new and better ways, we should never be too quick to criticise. It is better, after a new method is introduced, to let it "set over night" so to speak, and think about it before you come to a definite conclusion as to whether the thing is absolutely wrong or not.

The men who exhibit purebred poultry, especially at the big shows, are a pretty good sort, fair-minded and ambitious. All these things are essential to progress. However, if any certain method becomes an unfair practice, in the opinion of the majority, very few fanciers will continue to use the method in question. If they do, their action ultimately brings its own penalty.

At the New York Show last January, we White Leghorn men got together and I think that so far as the White Leghorn breeders are concerned, we have arrived at a solution of the difficulty. We held a meeting of the exhibitors at the Garden during the last show, and everybody present pledged himself to a gentleman's agreement that he would not model saddles. One or two members who were not at the meeting at that time have since informed me that they also would abide by this agreement, so I believe the matter is settled.

The public doesn't mind spending money for birds provided they get their money's worth, but nobody likes to pay money for males that look like \$500 in the show room and inside of a month develop a narrow back, saddle and tail. The buyer of such a male naturally feels that he has been humbugged. People object more to being taken advantage of than they do to spending money; and no practice can be countenanced that makes a mediocre bird a winner, for that means that the buying public's best interests are being overlooked.

Breaking back of saddle feathers is easy to do. In some cases the birds have been taken out of their coops after the judging began, taken down stairs, feathers and saddles fixed up, and brought back into the class. A bird so fitted is easily distinguished, for you cannot break back a feather without the quill showing it; so when the breeders say "No" to this practice, the judge need simply apply the rule and the whole matter is settled.

Representing the White Leghorn Club, I feel that I should speak for the leading breeders of this variety by saying that such practices will not be countenanced by the Club in the future. Also it is

almost certain that the next Standard of Perfection will embody the suggestions made by Mr. Platt to the Committee of Forty and contain more definite instructions to judges as to just what should be considered legitimate conditioning, and what is faking.

This editorial might have been headed: "How not to condition White Leghorn saddles," for Mr. Chapman speaks out in a clear-cut and uncompromising way for the White Leghorn specialty club and the leading breeders, and after discussing the problem presents a solution that does not admit of argument and must be final.

Light and Dark Brown Leghorns

No issue before the American fancy has aroused more interest than the Brown Leghorn question, for the American Poultry Association, as a standard making body, has been challenged to recognize and right what a majority of Brown Leghorn breeders have termed a wrong to their variety.

Two separate families of Brown Leghorns have been developed. The light line compromises that marvelous development of the breeders' art, the true brown female, whose neck is of golden yellow with a tendency to black striping in each neck feather, breast of salmon color shading off lighter under the body, and the surface of whose back and wings is of light brown covered with fine pencil points of black or of what some experts would term a peculiar shade of the darker browns. This is the beautiful, soft colored, exhibition female.

For many years the male mated to her has been selected for the special purpose of furnishing the soft color and producing the right quality of black stippling desired in his pullets. Texture and size of comb, wattles and earlobes have been considered in this pullet-breeding male, but only a limited importance attached to his body conformation and tail carriage.

His neck is lemon colored, with a tendency to a black stripe in the lower hackle feathers. His saddle is lemon or light orange in color and free from striping. His wing bows and the center of his back are light red, which make a band of darker color to contrast with the lemon neck and saddle. This blending of lemon and red makes what is termed a "two colored bird." The breast is black but the extreme upper and lower breast feathers may show a trace of red.

The tendency in all varieties has been toward a level color; and the two colored, lemon and red, pullet-breeding Brown Leghorn male was pushed aside as an exhibition bird, and his place filled by what is today known as the Dark Brown Leghorn male.

The dark male has the same shade of red over neck, back, saddle and wing bows. It is an even shade of rich, brilliant, cherry red, with a well defined greenish-black stripe running down the center of each hackle and saddle feather. The color of this male is similar in all respects to the best colored Partridge Rocks and Wyandottes. His breast, underbody and tail are lustrous greenish black.

How could so richly colored a male be bred from so soft brown a female as the exhibition hen? He is not bred, cannot be bred from the exhibition female. There are two lines of breeding in Brown Leghorns which are distinct and have not been crossed together in twenty years. It was back at the beginning of that time, that W. Theo. Wittman crossed a male of the light colored line, which is the older, on a Black Leghorn female, and with this reinforcement of color succeeded in producing the Dark Brown Leghorn male.

As would be expected from such an origin, the female that goes with this dark male is dark all over. The black stippling on her back is coarse almost to the point of penciling, and her breast is usually marked almost like the back. The black striping down each feather in the neck is distinct. It is her excess of color that produces the rich, dark males of the Dark line.

When these males began to appear in the shows, they won the prizes, and the males of the Light line were crowded

New club standard illustrations of a pair of Light Brown Leghorns. Copyright 1921 by the American Single Comb Brown Leghorn Club, and reproduced by permission.

out. Then the Standard Revision Committee of the A. P. A., meeting at Fishers Island in Long Island Sound, decided to put the Dark male in the Standard and drop out the Light male.

This was done, and the Brown Leghorn became a variety that could only be bred to the Standard by double matings, a light colored strain to produce exhibition females and a dark colored strain to produce exhibition males.

The Standard makers did not recognize both families, but picked out and described the male of the Dark variety and the female of the Light variety. These two birds with essentially different color types were called a Standard pair, yet every breeder knew that they could not be mated together with any hope of success. The Standard adopted by the American Poultry Association was, therefore, artificial, inconsistent, and the Standard Brown Leghorn was not a true variety.

Within the last two years the male which is necessary to produce the Light Brown female, and the female which is necessary for the production of the Dark Brown male, have both been granted recognition by the A. P. A., and the two full varieties of Light and Dark Brown Leghorns appear in the present Standard.

The Committee of Forty, whose report is to be presented at Seattle, has voted against Light and Dark Brown Leghorns being recognized as two separate varieties of Standard fowls. To accept this report would be to go back and put the Light male and Dark female

out of the Standard, and give no official standing to these mates which are indispensable in the propagation of the variety.

Not in many years have Brown Leghorns gained ground and attracted new breeders as they have since the American Single Comb Brown Leghorn Club announced a Standard for the two separate varieties. The Club itself has prospered greatly and now has a membership of more than sixteen hundred. So much momentum has been gained that the Club will not submit to a self-contradictory standard for the variety

it champions, no matter if the A. P. A. acts favorably on the report of the Committee of Forty. The Club has fortified itself through the expenditure of about \$250 for four idealized illustrations, a pair of Light Brown Leghorns and a pair of Dark Brown Leghorns, and is in position to issue its own standard for these varieties.

Standard making is a business that does not yield nicely to duplication. There should be but one standard. But what are the Brown Leghorn men to do, since the shifting attitude of the A. P. A. has carried the impression of undependability and lead to a suspicion of insincerity?

When the report of the Committee of Forty is presented to the A. P. A. at Seattle, the members present will act in the best interests of the Brown Leghorn and the future of the A. P. A. as a standard making body, if they recognize the fact that both Light and Dark Brown Leghorns are now in the Standard of Perfection; and then follow the precedent established at the Chicago meeting in 1914, when Frizzles were retained in the Standard after having been voted out at Atlantic City the previous year. It was pointed out in the argument at Chicago on the question of whether Frizzles were to be or not to be a recognized Standard variety, that once a breed had been admitted to the Standard and thus recognized as a Standard fowl, a property right was involved which could not be invalidated as long as any member of the American Poultry Association might continue to breed the fowls.

1000 BREEDERS FOR SALE Regal Dorcas White Wyandottes

My Summer Sale List this season is the most complete I have ever offered. The birds are all specially selected and were in my matings for 1921. Many of them will win in the large shows next Winter and all have grand breeding with generations of Regal Dorcas ancestry back of them. Bargain prices.

SPECIAL—500 January and February cockerels and pullets that will be ready for the September shows. Send for a trio or pen of these beautiful chicks to fill out your string.

FREE—Send for complete Summer Sale List. Twenty-page catalogue also free.

John S. Martin, Box 51, Port Dover, Ont., Canada

"First in Efficiency"

The acknowledged standard equipment that has been endorsed by America's poultry authorities for forty years—

PRAIRIE STATE Incubators and Brooders

Hatch the greatest number of the sturdiest chicks—raise them with the least trouble and loss.

Prairie State Incubators are guaranteed for ten years. Write for free catalog.

Moulting Hens Need Purina Chows!

DO your hens drag the moult along a good part of the fall? Ten chances to one it is because they do not get enough protein. Hens can't get enough of the right kind of protein for making feathers and eggs unless you give it to them in their feed. Laying hens draw upon body-tissues to partly make up any deficiency of protein in the feed, but they soon "run down," and quit laying. A premature moult results and the moult is drawn out indefinitely.

Build Winter Layers Now

Feed Purina Poultry Chows to make sure that your birds get plenty of the right kind of protein. To have heavy layers early this winter you must feed feather-building elements now. After hens have been run down by laying and moulting, it is too late to start. Give them *now* all the material they need for both feathers and eggs, and you will be repaid many times over.

Get results or Money Back

Purina Chows are *guaranteed to produce more eggs* when fed as directed, or your *money will be refunded*. See the nearest Purina Dealer or write—

Of course, regardless of what action the A. P. A. may take, Brown Leghorns will be bred in the future, as they have been in the past, by keeping the two lines absolutely distinct. The laws of transmission and inheritance do not yield to legislation.

The motion adopted by the Committee of Forty, which covers the Brown Leghorn issue, and which will be presented at Seattle, states in part that "it is not in the best interests * * * to admit divisions of varieties on the basis of differences in color, or shades of color, and we recommend that any action previously taken which is in any way contrary to this be rescinded."

A Little Trip to Cornell University.

At the invitation and through the courtesy of Jas. E. Rice, Professor of Poultry Husbandry, New York State College of Agriculture, we had the pleasure of spending the week of July 4 to 9 at Cornell University, which institution embraces the state agriculture college.

The occasion was the fourth annual "poultry judging and breeding school." About sixty poultrymen enrolled for the course, including not only residents of New York State but men and women in poultry educational work from New York, New Jersey, Pennsylvania, Oregon, Montana, Colorado, Mississippi, etc.

Practically the entire teaching staff of the poultry husbandry department of Cornell participated in giving instruction; and additional instructors from other states contributed from their knowledge and experience in culling chickens. These outside instructors included W. R. Graham of the Ontario Agricultural College; A. G. Philips, Indiana Agricultural College; J. G. Halpin, Wisconsin Agricultural College; H. R. Lewis, New Jersey Agricultural College; W. F. Kirkpatrick and Roy E. Jones, Connecticut Agricultural College. The Cornell staff included Professor Jas. E. Rice, Dr. O. B. Kent, L. E. Card, G. F. Heuser, L. M. Hurd, H. E. Botsford, L. E. Weaver and W. G. Krum.

Never have we met with a more earnest assemblage of poultrymen. It was a privilege and inspiration to be with them.

The instructors discussed frankly what they had learned about egg type and were candid to speak of errors made in the past and limitations which appear to exist at present.

What impressed us as a distinct step in advance was made by those professors who had in hand a revision of the instructions on "a method of judging fowls for egg production," which was first formulated at the judging school at Cornell University in 1918 and later approved by the American Association of Instructors and Investigators in Poultry Husbandry.

The old instructions started off with information on the pigmentation test and the molt. That was well enough from a mere culling standpoint.

It does not add to the potential egg capacity of a hen, from the buyers' viewpoint, to observe that the owner has fed the eggs out of her and thereby prevented a molt, exhausted the fat on the pelvic bones and secured a faded beak, eye ring, vent and shanks. The buyer of that hen should want to know what her capacity, as measured by type, indicates the bird is capable of doing under good management and correct feeding.

It was openly stated during the week at Cornell that the pigmentation test had not proved to be all that had been hoped and expected of it. We demonstrated this fact by estimating on the basis of faded beaks and shanks the egg production of two Barred Rock hens at 105 and 130 eggs, whereas the bird with the most yellow in her shanks had laid 116 eggs and the one with the lighter shanks had laid 98 eggs, according to trap nest records, up until July 1. The band numbers of these two hens were 2568 and 1482.

Mr. Botsford gave an illuminating talk on

the molt. He showed the correlation of molt and production, and linked the two together. He said: "Molt depends on production. Anything that upsets production has a tendency to cause a molt." In other words, if the feed is radically changed or suddenly reduced, or if a bird becomes broody and sits on the nest, the interference with production may cause a molt.

This explains why a late molter is a good layer. Her production of eggs has been continuous, without interference, and so she has not molted. The molt is, therefore, a common means of identification of good layers and has become recognized as an important factor in culling practice.

It would appear, however, that the molt is a better indication in Leghorns than in breeds that sit. Broodiness and the rearing of their own young is an important and valuable trait of the dual purpose breeds; but sitting and rearing a brood of chicks may bring on a molt.

In estimating the egg production of a Rhode Island Red hen that had very evidently been molting since early June, and was an early molter, we put her at 60 eggs. Her band number was 1879. Her trap nest record showed that she had laid 130 eggs.

Molt and pigmentation work better in culling Leghorns, although an exceptional bird now and then in this variety also proves to be a joker. There is, however, no question of the great value of the outward signs of old feather and amount of yellow in shanks and beak in the majority of culling work. But from a breeding and judging standpoint, the big thing to our mind is type. We believe that the future should see more study of body conformation of heavy layers, for constructive breeders will appreciate the fundamentals that make big production possible, and will not be content to merely see how long they can keep old feathers on a hen or how far they can fade the yellow fat pigment out of her beak and shanks by feeding methods that promote laying.

It would appear logical that there is a limit

to "lay or bust" methods and that the latest molter and whitest shanked hen is not the best and most valuable specimen. Prof. Graham told of putting a bunch of 200-egg hens in a heated house last winter, because they were molting so late and were so short in feather that he did not want them to freeze to death. Dr. Kent stated that hens with extremely thin pelvic bones and decidedly bleached out shanks, were not 100 per cent popular, the reason being that such specimens had so exhausted the fat in their bodies that they were not as good breeders as those birds which retained more color in their shanks and more fat on their pelvic bones.

There is a big field for investigation along this line of comparative anatomy. Dr. Kent and Professor Graham have learned some things. They have learned that one of the most important things in connection with fecundity is that in the heavy layer the back should be flat on top, and while somewhat wider at the hips than at the tail, it should carry its width well back to the tail, while the back of a poor layer may be wide at the hips and then round off on top and taper abruptly on the sides to the rump.

Dr. Kent has found that the keel bone should be long, and curved up a little at the rear, even though this means that the abdomen of a good male may be small rather than large, upsetting Hogan's measurement of abdominal capacity from pelvic bones to end of keel bone. Emphasis is laid on a deep body, as measured by placing the thumb on the hips of the back and the middle finger on the rear end of the keel bone, rather than by Hogan's method of measuring fullness of abdomen which fullness may be secured by a short keel bone.

These studies of the carcasses command respect. Much remains to be learned, but once it is determined what kind of body-type hens of the egg type breeds should have, the time will be at hand to recognize in judging practice the fact that there is both body shape and typical shape, the former dependent on

boney frame work, the latter dependent on plumage.

Typical shape is the general set up of the bird. Judging in our show rooms today is largely based on it, although the bird is handled to examine for crooked breast bone or roached back. However, the time will come, with the advance of knowledge, when we will have both "see shape" and "feel shape," and body shape as well as typical shape will appear on the score card. This will open the door for the constructive utility breeder and enable him to write into the Standard the body shape requirements of high producing hens. In doing so, he will not affect the fancier's description of typical shape.

One point, however, the pedigree egg breeder must watch. Professor Rice told of examining sixteen 300-egg hens on the Pacific coast and all but one had crooked breast bones. Egg production runs about 40 eggs per hen heavier in the Pacific Northwest; but in the East, crooked keels were referred to as also common in heavy layers. This defect will come in for a severe cut in body type when capacity is made a part of breed type, and utility is judged by body type rather than by a man's ability to feed for eggs, delay molting, and fade the color out of the shanks.

There is one danger to which we wish to call the attention of those interested in the heavier breeds, and that is the apparent tendency of the eastern college men to think of all hens in terms of eggs. The good they see in a Rock or Wyandotte hen is summed up in the total of her egg yield. It would be a mistake to model the bodies of the dual purpose breeds strictly along egg lines.

Professor Graham, who has been working with Barred Rocks for sixteen years, breeding the broody bumps off their heads, and pedigreering for increased egg production, remarked: "I know that in the Barred Rocks we breed the meat qualities are going down and the egg qualities are going up."

The popularity of the dual purpose breeds in the great Middle West, where 12 states

CANDEE—Nearest to Nature

Sturdy, healthy chicks that develop into strong, vigorous, heavy egg-laying birds are the result of correct incubation—a constant, even temperature from the beginning to the end of the incubation period—proper ventilation. These are the natural conditions for hatching found under the setting hen.

CANDEE Incubators

approach these ideal conditions of incubation as closely as is possible mechanically.

The CANDEE with its exclusive, patented, double automatic heat control, gives double protection against overheating and chilling—the usual difficulties in hatching.

The perfected ventilating system of the CANDEE assures sufficient oxygen without robbing the eggs of their original moisture. The automatic features of the CANDEE make constant watching and worry unnecessary.

The temperature in each hatching compartment is controlled by an automatic regulator, while another automatic regulator controls the drafts on the heater. Set at the proper degree, this regulating system compels constant, correct heat, no more—no less, regardless of weather conditions, temperature changes or storms.

CANDEE-Hatched chicks, because of their sturdiness and vigor, soon develop into hardy, healthy egg producers—quality birds that it pays to own.

The Big, Free CANDEE Catalog

gives in detail the many superior advantages of CANDEE incubators and pictures of many successful poultry farms in all parts of the country. Send for your copy today.

UNCLE SAM *Milk Albumen*

**For Bringing Up
Growing Cockerels and Pullets**

If you want your chicks to become strong, healthy cockerels and pullets—give them feed containing Uncle Sam Milk Albumen. It will keep them sturdy during molting period and put them in condition to lay more and better eggs.

One of the most important feed properties for chickens

It is rich in protein. Chicks thrive on it and relish feeds containing it. Being a pure milk product you know what it is and that it is pure, wholesome and will not get moldy. Use Uncle Sam Milk Albumen. It supplies vitamins so essential to thrifty, healthy growth.

Generous \$1.00 Trial Sample

You can give this pure food a trial. If you mix your own feed ask your dealer for Uncle Sam Milk Albumen, or get a mixed feed containing it. Right now we would recommend that you let us send you enough Uncle Sam Milk Albumen to feed 25 hens for 30 days. We will also give you a pamphlet telling in detail about it. This generous trial sample we will send to you postpaid upon receipt of \$1.00. Fill out the coupon, enclose \$1.00 and mail today.

have half the hen population of the entire nation, produce half the eggs, and grow half the chickens—the overwhelming popularity of the dual purpose breeds in this bulwark of poultry production rests on a satisfactory combination of meat and egg qualities. Without the meat end, without the potential raw material in every chick hatched, the dual purpose breeds would lose out. Therefore, they must not be Leghornized and bred to a non-sitting, poor-fleshing egg type.

CURRENT NOTES AND COMMENT

Length of Legs.

Theo. Hewes asks if the shank can be long without the entire leg, including the thigh, also being proportionately long. Our observation is that many birds are faulty because the shank is long and the thigh is short. Mr. Hewes suggests that this may be due to long feather growth on the under body and fluff. It may also be due to the thighs inclining forward from the hock and not being straight up and down.

Fortunately young breeders today are studying body conformation more closely, and not counting variations in the comb with old-time attentive application. They realize that they must have a chicken first.

Legs are important. Bone in the legs, straightness of the toes, spread between the legs are specifications in the foundation on which the chicken rests.

Standard makers, like almost all beginners, start with comb. They have been careless about legs. The Standard says Cornish shall have a short shank, Plymouth Rocks a medium shank, and Minorcas a rather long shank. If you open your Standard and lay a rule on the picture of the Cornish male, the shank, from hock to bottom of foot, will measure three-fourths inch; so will the shanks of the Plymouth Rock and Minorcas males.

The Minorca male in the Standard illustration gets its length from its drumstick, although the Standard says the Minorca thigh should be of medium length, the same as the Plymouth Rock thigh.

Theo. Hewes as a member of the Standard Revision Committee will open up to view some strange inconsistencies when he focuses his vision on "length of legs."

* * *

Early Shows.

The Hanover (Pennsylvania) Fair stages a large poultry exhibit, and excellent quality is always evident throughout the classes. It is a breeders' show, and professional car-lot exhibitors do not participate. Hanover is a county fair, yet a nationally known early Fall poultry show. It is an example of what can be done when the poultry department is turned over to an energetic fancier.

Last year the president of the Allentown (Pennsylvania) fair remarked that entries were not up to a high point because the cost of growing a chicken and the expense of shipping to the show had increased, while prize money remained the same. To help meet this situation the Allentown poultry department has reduced the entry fee to 50 cents a bird.

New York State Fair always has a big poultry show. It has been selected this year as the place of holding the annual meet of the American Single Comb White Minorca Club.

It is rather unusual for a national specialty club to hold its annual meeting at other than a mid-winter show, but the White Minorca breeders have special reason for meeting at Syracuse.

Large classes of big, true bodied White Minorcas have been an annual feature at the New York State Fair for years.

The Iowa State Fair is making special efforts to secure a big and representative entry this year. The Iowa State Poultry Breeders' Association will meet during the fair. The association secured a state appropriation of \$100 for every Iowa county for encouraging poultry shows. Associations in 43 counties applied for their \$100 this year. Fifty-six percent of the farm flocks in Iowa are reported to be purebred.

Indications are that the coming show season will be a big one. We are now receiving

THE **MUL-TI-DEK** SECTIONAL "Add a Section as You Need It" **IDEA**

The Result of The Poultry Raisers Demand

The Kind of "Mammoth" the Majority of Poultry Raisers Want

The tremendous response from poultry raisers who read my page advertisement in the poultry papers last month, in which I told them about the MUL-TI-DEK Baby Mammoth Sectional Incubator is conclusive proof that the MUL-TI-DEK is just what the majority of poultry raisers want.

With a MUL-TI-DEK you don't have to spend a lot of money for a big expensive Mammoth Machine. You can start with one 250-egg section and add extra sections as your business grows. That's why

It's A Big Winner

Beginning with one 250-egg section you can add extra sections up to 2,000 egg capacity—all heated with one heater—my famous Sol-Hot. These sections can be operated all at one time, or one or more sections can be operated independently of the others. In fact, I have designed and built this splendid machine to exactly meet the requirements of the average poultry raiser. My business of manufacturing the famous Sol-Hot Heaters for incubator and brooders, has brought me in close touch with the poultry raiser—his needs—his desires, etc. That's why I developed the MUL-TI-DEK to meet his demands.

Write for FREE Mul-ti-Dek Catalog Folder

Fill out and mail coupon and get FREE and postpaid, big illustrated folder, telling all about this wonderful Baby Mammoth, also FREE plans showing how you can build it yourself, if you wish. To owners of Mammoth Incubators heated with coal burning boilers, I can supply Sol-Hot heaters for these machines. Write me telling the kind of machine you have and I'll give you complete particulars.

NEXT MONTH—WATCH OUT!

I am going to announce the GREATEST IMPROVEMENT in poultry equipment ever attained—something the users of Incubators and Colony Brooders will hail with delight—because it so completely and efficiently overcomes the nuisances—losses—dangers—troubles—worries, etc., so common with the heating of incubators and brooders. It is trouble-proof—danger-proof—ABSOLUTELY AUTOMATIC—controls itself. You supply the oil—it does the rest. Watch for this important announcement NEXT MONTH. It's a bonanza for dealers, too.

H. M. Sheer Company, Dept. 26, Quincy, Illinois

Important Notice to Dealers and Agents of Poultry Supplies
Watch for my advertisements announcing the new startling improvements on Sol-Hot Heaters for Brooders and Incubators. Sol-Hot will be even a more popular leader this coming season. A word to the wise is sufficient—make your plans accordingly.

Help Your Hens Over the Moulting Season

Don't let your hens linger along for 4 to 6 months moulting. Get them thru the moult quick—a moulting hen is an expense instead of a producer. Every day counts and the feed you give them now will determine the profits produced later on.

Prepare your mash from our pure and wholesome basic feeds which we can furnish in as large a quantity as you wish—and they are always fresh.

Mr. E. C. Shelley, New Cumberland, Pa., says:
"I can recommend your feeds as the best."

Pinhead or Steel Cut and Rolled Oats

Let us send you one or both of these wholesome feeds to give to your growing stock. There is no better food found anywhere than these two for chicks.

Read What Our Customers Say!

Crate Fatten your market fowls and broilers. The accepted fattener is based on oatmeal. Send for our samples and prices or submit your own formula for pricing.

Send Your Formula Write and tell us what you are feeding and we will quote you prices that are governed by the quotations in the grain market, and when the prices go down you get the benefit. Could anything be fairer? Let us quote you on hulled or pinhead oats. We want you to know more about basic feeds as ground and sold by us. Let us send you our current price list; you can see what ground poultry meal is worth at mill prices.

BASIC FEEDS COMPANY, Box 325, LOCKPORT, ILL.

The Best and the Cheapest

From F. S. Cleworth, breeder of S. C. Black Orpingtons, Olds, Ia., dated June 7, 1921:

"Enclosed find check — for the following feeds —. Please ship —. Your feeds are the best and most moderately priced of any that I buy."

His Birds Thrive on Basic Feeds

From Andrews & Bradford, Spirit Lake, Iowa, breeders of S. C. W. Leghorns, dated June 18, 1921:

"You may ship —. We are very much pleased with the feeds we have purchased from you in the past. They are always fresh and sweet, and our birds have thrived on them."

notices of dates claimed for winter shows. Same will appear in our poultry show date column next month and each succeeding month during the show season. Keipper Cooking Co. report a heavy inquiry for exhibition coops, and show secretaries in writing express anticipations of big entries.

* * *

Heart of Chicken Lives Eight Years.

Dr. Alexis Carrel, once awarded the Nobel prize in recognition of his surgical achievements, started in 1912 to sustain the growth of a heart extracted from an egg in the embryonic state. The report is that the heart has retained its spark of life for the past eight years. It is said that every day scientists connected with the Rockefeller foundation take the living tissue, lay it on a marble slab, and cut it in two to prevent its enormous increase in size by the process of cell division and cell multiplication. The experiment seems to indicate an indefinite prolongation of life by artificial methods.

* * *

Illinois Appropriates.

The Illinois legislature has appropriated \$4,200 for the operation of the egg-laying contest started at Quincy by the Illinois Poultry Association, the egg laying contest at Murrphysboro in southern Illinois, and the Illinois State Poultry Show. The appropriation also carries \$2,000 for repairs and equipment, \$2,400 for chief poultryman, \$3,600 for two assistants, \$1,200 for stenographer, \$1,000 for office expense, \$5,000 for travel, \$2,000 for repairs and equipment, and \$5,000 for contingencies.

Credit for this appropriation is due the Illinois Poultry Association, an organization of purebred breeders of which A. D. Smith is secretary, Quincy, Illinois.

* * *

English Silver Wyandottes.

J. H. Drevenstedt desires to make the following correction "not only in justice to Dr. Chambury as a breeder, but as a matter of historical record in the progress made by American Silver Wyandotte breeders in perfecting type and color."

"In my comments on Englishbred Silver Wyandottes in Dr. T. H. Chambury's yards, an unintentional misstatement appeared by stating that the hens were imported from England by Dr. Chambury which, however, is not the case, as the following extract from a letter received from him last month explains:

"Fact of the matter is this: This pen of females has three different kinds of blood coursing through their veins, as a result of careful mating and breeding, with improvement in type, hackles, and flights in view, at the same time holding the intense metallic black lacing, all of which I have accomplished as you perceive.

"What I did tell you was this: That I had imported the cock bird heading the pen, direct from Mr. Philipson a little over a year ago—and there is where you probably misunderstood me. I have imported females from Mr. Philipson but never yet have I seen a pure Englishbred silver that carried the type, silver hackles, or flights that these birds do. As for lacing Mr. Philipson has no peer."

* * *

Tried Feeding Yeast.

O. M. Titus of Indiana sends the following communication: "Have read your editorial in July issue re yeast. I tried feeding some to seven White Leghorns. They liked it (yeast foam) and preferred it to rolled oats. They did well on it and looked extra bright but the feeding was discontinued. No test was made other than to see if they would eat it and if it would do any harm.

"Am sending a clipping I found in an early issue of 'The County Gentlemen' for 1914. I believe it will be of interest to you. We surely were asleep when we failed to notice it more closely. Who knows what our fowls will do on dry yeast, dried buttermilk and the phosphoric acid from bone meal?"

The clipping referred to is as follows: "Relations between agriculturists and brewers in Germany have recently become more intimate owing to the development of an industry that, on the one hand, increases the profits of the breweries and, on the other, furnishes farmers with a rich and stimulating food for livestock—dried yeast.

"Recent tests made in Berlin show that dried yeast is one of the richest concentrated foods, that it is relished and well assimilated by all kinds of livestock, and that it is especially suited for fattening purposes. For sheep it has a higher nutritive value than

The Schwalge Sectional Incubator

400 or 600 egg sections. Single or double deck. Can be enlarged to 9,600 egg capacity.

Additional Sections may be installed within two minutes. Every egg chamber holds 200 eggs, and is a separate unit.

BUCKEYE MAMMOTHS

Pay Big Profits

THEIR success the last two seasons has firmly established the money-making possibilities of the Buckeye Mammoth Incubators.

First and foremost are the results produced--the hatching of the largest percentage of remarkably big and vigorous chicks, most satisfactory to the purchaser.

Just a word in praise of your No. 7 machine. It sure is a wonder and I don't know how anybody will work and fool along with any other make when these machines are available. S. Barton Lasater, Paris, Tenn.

MADE IN THREE SIZES

No. 7, 10368 eggs. No. 8, 4600 eggs. No. 6, 2440 eggs.
Case--Selected California Red Wood, Cabinet Finish.
Boiler--14 oz. Cold Rolled Copper. Radiator--Cast Iron Pipe.
Electric Ball Bearing Fans especially constructed for incubator service.

Blue Flame Gas or Oil Heater.

Two specially constructed Thermometers.

Solid Brass Hardware.

Double Disc Thermostats, specially constructed.

No. 7, 108 turning trays; 36 hatching trays. No. 8, 48 turning trays; 16 hatching trays. No. 6, 20 egg trays; 122 eggs each.

Size--No. 7, 8 ft. 6 in. square, 7 ft. 3 in. high.
No. 8, 5 ft. x 8 ft., 5 1-2 ft. high.
No. 6, 5 ft. square 32 in. deep.

Second, they represent less capital per installation, because no special building or cellar is required and because they are compact and convenient.

Third, the labor saving features of these big machines require less attention and time.

Fourth, the economy of their operation adds materially to the profits.

Get Yours Now!

Buckeye Mammoths make commercial hatching far more profitable, reducing the hazard, increasing the output and cutting off expense.

Last season many whose orders came in too late were disappointed. While we are manufacturing a much greater output of Mammoth Incubators this year, those who bought last year are asking for a large number, and we will not have many for sale to those who have not heretofore used Buckeye Mammoths.

Therefore, that you may obtain one of these machines, it is essential that you act at once. Write today for the Mammoth catalog and prices. They will prove to you what they have proved to many others--insurance of success in commercial hatching.

cottonseed meal. More than half the grain ration of horses may be replaced by dried yeast and dried potatoes without detriment. A mixture of dried yeast, dried potatoes and some barley, without any dairy by-products, form a suitable, rapidly fattening ration for young pigs. The use of dried yeast increases the butterfat content of cow's milk at least temporarily. It is equal to meat meal for stimulating the laying of poultry and the fattening of geese."

* * *

Rapid Growth in Orpingtons.

Dr. Geo. B. Edwards of Pennsylvania writes: "Can They Beat It? The writer has a Rose Comb Black Orpington cockerel that broke the shell March 23, which he believes will break the record this present season for young heavy weights. June 23 this youngster was just 3 months old and weighed exactly 5 pounds 5 ounces before breakfast.

"Now the burden of my inquiry is this, can our Black Giant or any other heavyweight friends beat it?"

* * *

The Question of Size.

In the spring of 1912 Franklane L. Sewell, the world's premier poultry artist, wrote us: "I trust the bantam is to become one of America's practical classes—to take its place where it belongs—where the big birds cannot thrive on account of being 'too big.' Such a condition would tend to give proper values to quality and delicacy of flesh as well as to the very fine beauty of the lilliputians. Frank, the fancy has been 'size mad' for a long time. If actual values could be generally appreciated, true qualities would be seen in many races that are sometimes sports by too much 'bigness.' Old Harrison Weir once impressed me by writing me 'a fowl can be too big to be good.' Size may be of great value—but efficiency and quality first—then as much of that quality as possible."

* * *

Instructions to Judges.

D. Lincoln Orr plans to issue the following instructions to each judge at the forthcoming New York Show:

"In judging double tiers, birds in lower tier must be given full consideration. Judging cages will be furnished for making comparisons. If needed notify secretary or superintendent.

"It is always safe to consider shape as the greatest factor no judge can go far wrong if this rule is adhered to.

"Judges must not carry on conversation or arguments with exhibitors or visitors while judging nor allow anyone to stand too close so that remarks can be heard."

* * *

A Year Around Program.

What is your poultry association doing to keep up interest in the monthly meeting? It is easy to secure a big attendance of members just before show time.

The Gloucester County Poultry Association, Inc., of New Jersey, has an educational committee, which has announced an educational program, and the association has made a drive for membership, asking all local breeders to join and participate in the educational advantages of their meetings.

The following is the program of subjects for discussion at the monthly meetings:

- August —Selecting and conditioning of birds for shows.
- September—Feed and care of molting hens.
- October —How to prepare to get winter eggs.
- November—Ventilation and artificial lights.
- December—Feeding for winter eggs. Rations for different purposes. Judging. Marketing of eggs.
- January —How to improve the flock. In breeding and the results. Line-breeding. Water for fowls in winter.
- February —Feeding the breeding stock. Selection and care of hatching eggs.
- March —Natural and artificial incubation and breeding. Care of baby chicks. Baby chick diseases and remedies.
- April —Hopper feeding. Range for growing stock. Culling.
- May —Late hatched chicks. Ridding fowls of lice.
- June —Caponizing. Selling of surplus stock. The broody hen.
- July —Care of growing stock. Poultry diseases and remedies.

PROFITABLE LEGHORNS

You must buy good stock if your pullets are to make money for you. Queensbury trap-nested pedigreed Leghorns have the vigor plus years of breeding back of them. And they are reasonably priced—so you can earn a profit from them.

All our stock is raised on free range and in small flocks. Buy Queensbury pullets and pedigreed cockerels now—if you're not ready to get them, reserve them for later. But do it now.

Queensbury record making yearlings for breeders are now being sold at half price, ranging from \$2 up. Whenever you see this trade mark remember that Queensbury Leghorns are guaranteed to please you.

Summer Care.

(Continued from page 759)

keeping his eye on everything. It is generally such birds that are overcome with the heat, while birds that are not so vigorous and active that seek out a shady place and stay there all day will not die.

Early in my life, when I first became interested in raising poultry, I accidentally discovered the greatest food in the world for chickens. In those days my family was interested in the milk business and we kept a great many cattle. Some early chicks, hatched in February and March, I put in a coop and placed in the barn back of the cows. Then each night and morning at milking time I filled up those chicks with all the new milk that they would drink. Later on I experimented to find some other ration that would produce as good results, but I have eventually come to the conclusion that nothing will take the place of milk in some form for growing chickens. Many of the processed forms of milk are good, but the nearer you can get to the real article, the better it is for your birds.

Dual Purpose Breeds Popular.

(Continued from page 762)

extending over several years preceding the war that it cost an average of 43.4 cents to produce Leghorn pullets, while another experiment conducted in 1916 with White Plymouth Rocks, at feed prices comparable with those during the Leghorn experiment, showed a cost of 79 cents for producing a White Rock pullet. The report of the fourth laying contest at Storrs, Connecticut, shows that the Leghorn hens ate an average of 78 pounds of feed per year compared with 92.7 pounds for Plymouth Rocks and 93.9 pounds for Rhode Island Reds.

The Government Poultry Experiment Station shows that where general purpose pullets laid 130 eggs compared with 138 for Leghorn pullets, the yearling general purpose hens laid only 88 eggs compared with 125 for yearling Leghorns. The general recommendation of poultry authorities is that the dual-purpose hens should not be kept more than two years for profitable production while the Leghorns can be kept for three years. This means that with the general purpose varieties more chicks must be hatched and raised each year.

Those who favor the Leghorns say that though the poultry business may be a side line on the farm, it should be governed by business methods rather than by sentiment. They say that incubating and brooding equipment is a necessary part of the modern farm equipment and that broodiness in a hen is a handicap rather than a benefit. The Storrs station shows that Leghorn hens lost an average of less than two days a year from broodiness while Rhode Island Reds were idle thirty-eight days from this cause.

Those who favor the egg type birds also claim that white eggs always hatch better than brown. Phillips states that approximately fifteen more chicks can be expected from each 100 white eggs than from the same number of brown.

So the argument goes on between

The Story of Newtown efficiency as told by Newtown users:—

Greensboro, Md.,
June 23rd, 1921.

At present we have Newtown capacity for 10,800 eggs and have just arranged with your Mr. Wixson for addition of 5,400 egg capacity.

Our hatches this year ran about 80% of eggs put in. Our own eggs ran a little higher, but we did a little custom work with many brown eggs which lowered the average. Last year's average was about 75%.

Have used Newtown equipment throughout ever since plant was established and find it satisfactory and the men back of it anxious to make good.

EGLANTINE FARMS.

Berea, Ohio
June 27, 1921

I added a 7200 Newtown Incubator last year. It gives excellent satisfaction and produces not only quantity but quality chicks.

My Famous Anconas have been winning 90% of the first and second prizes at the Madison Square Garden Show for the past fifteen years, and this Famous strain also holds the world's record for egg producers, having a flock record of 256 and an individual record of 331. So you see it is very important that my chicks are hatched right in order that they may get the proper start. I am doubling my capacity this year to take care of the heavy demand. I am looking for a still better business next year.

H. CECIL SHEPPARD.

New Orleans, La.,
June 25th, 1921.

We have been using The Newtown Giant Incubator for the past five years. It is a 4800-egg machine and we run it in sections of 1600, this number coming out each week during our hatching season. We have been hatching somewhere around 20,000 chicks each year, and the percentage of chicks hatched runs from about 70 in period of low fertility to 95 or over when the fertility is high.

We find the Newtown to be extremely reliable in this country of rapid climatic changes.

CONRAD KOLB.

Fontana, Cal.
June 23, 1921.

We have one 12,000-egg machine and have had a most successful hatching season. We hatched 35,481 strong chicks out of 47,007 eggs, which is 75.4% of all set and 83.5% of all fertile eggs. Hatches of this kind are very encouraging and profitable. The chicks are of high quality, in fact they were the huskiest lot I have ever seen.

The cost of operation is exceedingly low for this machine. It burns 55 pounds of coal every 24 hours. The automatic features of this machine are about all that a person can ask for.

E. J. HAUSER,
Fontana Farms Co.,
Fontana, Cal.

Chambersburg, Pa.,
June 24, 1921.

We have hatched 140,000 eggs this season. Many hatches averaged 75%, some even better. We think the Newtown is *The Machine*, it is easy to operate and produces large hatches of large, fluffy chicks.

We can truthfully say our two 12,000-egg incubators have been a good investment. We have ordered another 12,000-egg machine for next season; this will make us a capacity of 36,000 eggs.

I. J. CORMANY,
Brandon Hatchery.

Center Moriches, New York,
June 22nd, 1921.

We take pleasure in reporting a successful hatching season with the Newtown Giant Incubator. The average hatch was 75%, and we are convinced would have been higher but for excessive infertility. We found it was a waste of time making a second test on the 14th day, since there were practically no eggs to remove. The chicks hatched were large, healthy and vigorous, as is always the case in a successful hatch. *We unhesitatingly state that we consider the purchase of this machine to be the most profitable investment on the farm.*

SCHLEIN'S BLUE RIBBON POULTRY FARM, INC.
PAUL SCHLEIN.

Big hatches—wonderful chicks—ease and certainty of operation—finest construction. These you should demand of an incubator—these you get when you buy a Newtown. And all at a price you can afford to pay. Write for our new booklet that tells about present-day conditions in the poultry field. And tell us what size incubator you need. We have a special proposition for you.

CARBOLA
The Disinfecting White Paint

So Easy to Use

ALL successful poultry raisers know that next to a proper supply of feed and water the most important thing in poultry raising is to keep the houses clean, and the birds free from lice and mites. *It is always important but especially so in hot weather.* Sickness or disease usually starts in unclean quarters and in such quarters lice and mites are always more plentiful. Thousands of poultrymen do their whitewashing and disinfecting in one operation by using

The Disinfectant That Dries White

Carbola is a white paint in powder form combined with a disinfectant many times stronger than pure carbolic acid. It is harmless to the smallest chick, and is ready to use the minute it is mixed with water—no waiting or straining. It can be applied with a brush or a spray pump—it will not clog the sprayer—and does not blister, flake or peel off. One gallon—a pound of the powder—covers 200 square feet. It does not spoil, even after it is mixed, and has no disagreeable odor.

As a Louse Powder

Carbola gives most satisfactory results and costs about one-third as much as the other brands. It should be used just the same as any other louse powder is used. Dust it well into the feathers, working the powder in with the fingers, especially under the wings and around the vent to make sure it reaches the skin.

Give Carbola a trial instead of whitewash and disinfectants in your poultry houses, cow barn, stable, cellar, warehouse or outbuilding. It will save you time and labor, will turn a disagreeable job into pleasant, agreeable work—make it easier to do work that must be done. Get some today and have it on hand when you want it. Money back if not satisfied.

Your Hardware, Feed, Drug or Paint Dealer has Carbola or can get it. If not, order direct

those who favor the different types. A great many farmers are testing Leghorns in comparison with other breeds, and in recent years the Leghorns have made great gains as a farm bird, but what the ultimate farm breed will be does not yet appear to be decided.

Summer Care of Stock.

(Continued from page 761)

to win in the show must not be wild and flighty, but should be reclaimed from possible savagery and present itself in a highly civilized condition. Feeding growing chickens from the hand and picking them up occasionally will teach them that there is no danger of contact with a true fancier; and instead of going up in the air every time one enters the yard they will come toward you and expect to be petted.

The old fowls, as well as the young ones, should be given attention at this season so they will be in proper condition and through the molt when the winter shows begin. Cock birds that were in the breeding yards and are being kept over should be separated from the females and allowed to rest and get in better flesh by being put in a small yard with open front roosting coop for one bird. All males not suitable for holding over for breeders or show birds should be sent to market. The little things that are done now in the way of care and feeding will prove of great value later and every fancier must devote some time to his birds in summer if he expects to make his business profitable.

Fields and Ranges.

(Continued from page 764)

some temporary crop, as buckwheat or soybeans. But green plants where the pullets can have excess to them.

The writer thinks a lot of red clover as a green crop for the summer poultry range. The birds like it. They like alfalfa, too. Some such crop is money well invested. Pullets won't grow uniformly and rapidly without green food. It can't be done. In these days when we are raising chickens in a business-like way we can't ever afford to underestimate the value of green food.

Feed for Growth.

While sitting there in the auto talking about the pullets just over the fence someone brought to mind another pullet flock, Barred Rocks they were, too, which had been recently visited and which had been found in quite different condition of flesh from those before us. The Rocks had been well-bred, and in fact, had been given almost unlimited range, where shade and roominess were ideal, but something was wrong, as the pullets were thin in flesh and many had been lost. Two minutes observation of their behavior when given a handful of grain provoked the question as to how much feed they had been given. The owner had been trying to grow healthy, vigorous pullets on an almost feedless diet, and he couldn't do it.

Growing pullets eat a lot of feed, grain and mash, but they keep accounts and render returns for value received later when they start laying. Cracked corn and wheat, equal parts,

KILL LICE

THE BEST AND SURE WAY

Protect your fowls from the powerful and insidious lice and mites that suck the life-blood of your birds.

These parasites allowed to run rampant in a hen house will suck more blood, more vitality over night than fowls can replace by the assimilation of large quantities of food during the day—think this over.

Extra care must be taken that not only the birds are kept clean, but every crack and crevice as well.

Licecil

Kills Lice

No dusting—No dipping—No painting—Just hang up the bottle

—and in a few days your entire flock and hen house will be rid of every louse and mite. Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

How to Use Licecil

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

1 Bottle, \$1.00; 3 Bottles, \$2.50; 12 Bottles, \$9.00—All Postpaid.

Secrets of Expert Exhibitors and Easy Lessons in Judging

By FRANK HECK

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider the immense advantage you would have in being able to detect faking.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained.

You need the book to protect yourself against the dishonest fakir and you need it to put yourself on an equal footing with your honest competitors. It will save you many dollars in useless entry fees, and it will show you how to win the coveted prizes. Don't put off sending your order. You need the book NOW. The price of the book is, including postage, \$2.00.

forms a good grain mixture for growing birds, and a plentiful scattering morning and night, just what the pullets will pick up, is the amount. The dry mash, kept before the pullets in large hoppers from the day they strike the ranges to the day they leave them to go into laying quarters, is indispensable, for in it are many of the elements that build flesh and bone. Among the ingredients which should be found in such a mash mixture are wheat bran, wheat middlings, or red dog flour, ground oats, cornmeal, powdered milk or buttermilk, and meat scrap. The feed bill for birds on range runs high 'tis true, but the results of Wilburtha rather than on the Barred Rock farm we mentioned a moment ago. The one succeeds, while the other fails.

The Colony House.

One cannot visit the fields on a poultry plant without glancing at the small little houses that are the nighttime abode of the youngsters, the colony houses usually called. And one should always find these planned and kept more or less systematically as follows:

a. Roomy, for over-crowding at night lowers vitality and undoes what growth might have been accomplished during the day. From fifty to seventy-five pullets per house is a good unit, but whatever the number, allow lots of room, both floor space and perch space.

b. Clean, for disease germs and insect enemies soon become established in a filthy colony house, and they proceed to wreck the health of the pullets. Keep the litter dry and clean. Coarse shavings make a good litter for the summer colony house. Disinfect the whole interior at the beginning of the season and as frequently as may be necessary with a five per cent solution of some good commercial disinfectant. A disinfectant whitewash is liked by many, including the writer. A good workable formula consists of

5 pails cream of lime (fresh stone lime slaked with hot water).

1 pail kerosene.

½ pail disinfectant.

6½ pails of hot water.

Add salt or lard or glue to make stick.

c. Airy, well-ventilated, with open windows. 'Nuff said.

These are just a few impressions that we gathered as we rested along side this Jersey chicken farm. Too much attention can never be paid to ways and means of bettering our methods, and after all we usually find that certain fundamental principles will guide us to successful accomplishment, if we but take time to think them over. Treat the pullets right! The industry will need every good pullet this coming year.

Growing Superior Young Stock.

(Continued from page 763)

worse until it can no longer pick up grain. This seems like a tragedy in an otherwise beautiful pullet, but, as no surgery seems to help, it is as well to accept your luck and kill her. Another victim must be the bird with a wry tail due to a deformity of the

back. This also goes from bad to worse. By feeling along the back the hump may be detected and the owner may decide whether a deformity is there or whether it is merely a habit of the bird to turn his tail to one side when stooping to eat.

It is necessary with the American and English varieties to examine the legs of the cockerels when selecting, in order to pick out those with traces of leg-feather. These come along the outside of the shank and between the toes. Many a young exhibitor has received his first unpleasant surprise by having a really fine specimen disqualified, not even scored, because the judge found feather-stub on the shanks. Bad cases of leg-feather can be detected very early and the birds culled out. A slight piece of down between toes is not serious. A person with whom the writer is on very intimate terms once had a bird disqualified for a fleck of down at a local show. The bird was sold the next week and appeared in Madison Square Garden show, New York, winning the blue ribbon. Needless to say, the offending down between its toes had disappeared.

Points to Know Before Culling.

Chick feathers are deceptive. Black chicks often have white feathers which give place to black ones later. In all breeds it is the adult feathers that tell the story. In penciled varieties a pullet with inferior markings may molt out into a well penciled hen.

Size is more important than shape in growing cockerels. Among the larger breeds, cockerels that shape up early often look the prettiest but never make full size. The awkward, long-legged birds, that look all corners and angles when growing their frame, may round out into beautiful specimens when their hackle and saddle feathers are fully grown. Choose for your surviving cockerels those with plenty of leg-bone. Hen-legged males, or short-legged specimens are not desirable. The rangy cockerel does not look so rangy when fully developed, but the short-legged bird seems to settle down and becomes a "creeper."

Additional defects that will soon be claiming your attention are noticed about the head. Some rose comb birds have a lump at the rear of the comb where a point or spike should be. Side sprigs appear on single combs. The eye may be off-colored. Watch also for white in ear-lobes that should be red. It is what is called enamel white that is objectionable; not the paleness that is common in growing stock. An earlobe that becomes red when rubbed between thumb and finger is not marked with enamel white on the outer skin. One of these defects of comb, eyes or lobes occurring singly, need not condemn an otherwise fine specimen. When two or more occur in one bird and you have other good ones free from them, it is the defective cockerel that must go to the block. It may be wise to keep and breed from a male of unusually fine type and color even if he has a disqualified comb. He is likely to transmit his comb defect to only a few of his progeny, perhaps to none.

In penciled varieties, mark with an extra web punch or put an extra cellu-

Cockerel Sale

Beginning August 1, I am making a special discount on March and April hatched cockerels from my three S. C. W. L. FUNK'S INTERNATIONAL STRAIN pens. Regular \$7.00 Grade A cockerels, \$3.50 each; \$6.00 Grade B cockerels, \$3.00 each; \$4.00 Grade C cockerels, \$2.00 each. No reduction in prices up to 50 birds.

Buy your next year's breeders now at just one-half the price. These males are extra strong, vigorous individuals and of the type and quality that will put the highest of egg laying strains into your own flock.

A few yearling hens for immediate delivery at \$3.50 each. Satisfaction guaranteed. Return all birds at my expense, if not satisfactory.

FUNK EGG FARM, Lyle W. Funk, Sole Owner.

Box 38, Bloomington, Ill.

ROAST CAPON ROAST UNOBSTRUCTED VISION

If you don't know Capon you don't know Chicken! Nothing equals roast capon—always sweet, tender, rich, delicious. June and July hatched cockerels should be caponized now for your Christmas, Winter and Easter dinner parties. Any surplus brings fancy prices at that season. Do not think of attempting the operation with old style, clumsy, hand-in-the-way, peek-a-boo types of tools, that are difficult to use and uncertain in results. The above design enables beginners to succeed from the start. Success and satisfaction guaranteed or money refunded.

Dear Sir—Caponizing is a pleasure with your tools. From remover to tearing hook they are A-1, requiring only a small incision. I caponized a Leghorn cockerel weighing only 8 ounces, he is growing fine. Haven't lost a bird. Previously used a widely advertised set, lost many and had lots of slips. I'll not mention names but they might be called "stung." Your instruction book is what it should be and not an advertisement. You do not claim "a child can do it," yet such is the case. My daughter, six and a half years old, can caponize and explain the operation to others, using correct names and terms.

(Signed) Mrs. JOSEPH NEFT, Earman, Fla., June 20, 1921.

Full set and directions, \$5.00. Remover and directions alone, \$3.50, sent prepaid upon receipt of price. No duty nor delay. Order from this Ad or send stamps for illustrated literature, ideal poultry yard and special introductory offer.

Homestead Silver Campines

The vigorous strain—dominate in the world of Campines. The wonderful BELGIAN fowl—noted for their heavy egg production—"THE EVERYDAY LAYER" unequalled as BROILERS. These birds are not alone FAMOUS for their UTILITY, but are BEAUTIFUL and MOST interesting. Some wonderful breeding stock for sale directly after the breeding season closes but now is the time to book your order that you may not be disappointed. Eggs Half Price Balance of Season.

HOMESTEAD CAMPINE FARM,

Box A,

WAYLAND, MASS.

loid band on the leg, these cockerels which at six weeks or so show extra good penciling on their wings. When they molt these first chick feathers, they are replaced by others entirely different, and there is really no means of judging the capacity of a grown male to produce penciled pullets apart from his pedigree. Therefore, those males that are identified as having had extra good penciling when chick feathered are valuable for pullet breeding.

It is astonishing how rapidly this kind of selection will bring up the quality of a flock. No extraordinary skill or magic is needed to breed fine birds. They respond so readily to careful selection that a man of ordinary intelligence, provided he has patience and a real love for his birds, can soon annex a goodly collection of ribbons and have honorable rank in the fanciers' fraternity.

Molting Old Plumage and Growing the New.

(Continued from page 760)

sign that she is a long distance layer that has not dried up and gone to molting. The practice of culling out early molters is for the purpose of eliminating the hens that are not persistently good layers. The practice, however, seems to work better with the non-sitting breeds than with the dual-purpose breeds. A female of the dual-purpose breeds that is set on eggs and allowed to brood a clutch of chicks, may begin to molt in June or early July before she has weaned her chicks. She may have been a very good winter and spring layer, and after the molt proves to be a good late summer and fall layer. The starvation during the setting period and the change of feed when running with the chicks, brings on the molt. If hens were culled merely by the condition of their plumage—by the molt—more than one good Rock, Wyandotte, Red and Orpington would be eliminated.

It used to be the policy to change and reduce the feed that hens were receiving during the summer, to encourage a molt. This was called a "force molt," and the purpose was to get the necessary and unavoidable process of shedding over with so that there would be increased productivity during the early winter. The present-day policy is to let hens lays as long as they will, and then molt of their own accord.

Birds Growing New Plumage Require Good Care.

The beauty of all new plumage depends to some extent on feeding and condition. Buffs that are faded may molt out quite beautiful if shaded during the process. Many Red females come in lighter in color after molting, but the number of non-fading Rhode Island Red hens is increasing.

Purple bars on black feathers are sometimes the result of lice or retarded feather growth. Creaminess in white birds results from feeding yellow corn during feather growth or may appear in birds enjoying free range, but will largely disappear as the sap in the feather dries out. One of the most important things in man-

agement is to see that the growing tail plumage, particularly on males, does not become broken as a result of the roost being too near the wall. These are simple things that will not transform a poorly bred bird into a good one, but may make a difference of a first instead of a fourth prize.

Vigor is of particular importance in both young and old birds and every thing that serves to maintain high vigor contributes to the production of good plumage. Poor feathering is a sign of poor health and poor management. Of course, in marked types, the cockerels feather slower; but a chick which looks ragged and wretched when others of even age are well clad, is what an English fancier would call a "bad doer," and should be culled out.

U. S. Poultrymen Make New Breed.

(Continued from page 765)

heredity standpoint; but Mr. Lamon says that "the fact that quite numerous individuals have been obtained possessing red lobes and laying white eggs encourages the belief that the fixation of this combination of characters is merely a matter of continued breeding and infinite pains in selection."

While red lobes and white eggs in the same individual has been a problem, the solution of which has been closely watched by many poultrymen who have been familiar with the breeding work being carried on at the Government Farm, there have been additional obstacles which have required careful selection and thoughtful breeding.

The original crosses were White Rock and Silver Gray Dorking, and White Leghorn and Silver Gray Dorking. While this cross breeding appears simple enough, it brought into the offspring a number of diverse characters.

One of these was the fifth toe, inherited from the Dorking, and the tendency to it had to be eliminated. Another characteristic of the Dorking, white shanks, which is equally dominant in breeding, had to be controlled, and the yellow shanks of the White Rock and White Leghorn substituted. The color of the shank in this case indicates the color of the skin, and yellow skin was necessary to make the breed typically American. White skin would be typically European.

The color of the plumage also had to be controlled. The white of the White Rock is not satisfactory for crossing, because it is not a dominant white; and a large percentage of the progeny of the White Rock and Gray Dorking cross inherited color from the Dorking dam. The white of the White Leghorn, which includes a factor that tends to repress the appearance of color in the progeny, helped out in the matter of establishing a pure white plumaged race. From the Leghorn, however, there can in addition to the white ear lobes, the factors of small size, rangy body and thin covering of flesh, all of which had to be modified and bred up.

The splendid bodies that Mr. Lamon has bred in his birds are a subject of comment by all who have seen the fowls. The illustrations accompanying this article of a pair of Lamonas show this splendid substance of body. The young breeder should stop to note this distinct type. He hears today so much about selecting birds by the symptoms of late molting and faded shanks that there is danger that he will attempt to breed by these outward signs, thereby overlooking size, color and the fundamentals of breed character. Mr. Lamon, a fancier, breeder and judge of purebred poultry, knows that molt and pigmentation are only the result, the sequence of egg laying and while useful in culling practice, the primary characters of breed type must ever remain foremost in the work of the constructive breeder.

NIEMANN BROS. MFG. CO. Box 677 MT. OLIVE, ILLINOIS

live stock when breed type is so immutable that it may be taken as a matter of course and selection based purely on performance. A sway-backed, fat bellied sow may save 38 pigs out of three litters, and thus prove to be a wonder for utility, but from the standpoint of breed progress, a member of the swine family so defective in body shape would not be worth more than butcher prices.

A constructive piece of breeding work, such as Mr. Lamon has done, comes at a critical time to add emphasis to the importance of making breed character, the true basis of selection. The ideals of breeders are indispensable. And the sentiment that springs from the work of selecting to an ideal is needed. As Professor W. H. Smith, an authority on breeding beef cattle and swine, recently remarked: "To take idealism and sentiment out of breeding would be like taking love out of marriage—nothing worth while would be left and the whole union of man's interest in animals would be split up and go down on the rocks."

Mr. Lamon is a man of ideals in breeding as well as a man of ideals in life. The Lamona had its birth in those ideals

The question now turns to the best means of distribution of this race. On this matter the following statement has been issued by the U. S. Department of Agriculture:

"The new breed is not yet ready for introduction and no specimens or eggs will be sold until the characteristics sought have been more firmly fixed. It is as well or better developed than were several of the breeds and varieties when they were introduced by their breeders, but the specialists of the department believe that it is not sufficient to have a limited number of specimens that measure up to the ideal. They want the characteristics so well fixed that the fowls will produce a high percentage of progeny of the ideal type. When a sufficient stock of such birds has been secured specimens will be sent to State agricultural colleges and experiment stations to test their adaptability to different sections and conditions."

Color of Speckled Sussex.

In mating the Speckled Sussex the first thing to consider is type. The Sussex fowl has a type distinctly its own, and it is a type that is both practical and very beautiful, and breeders should strive to maintain it.

In picking the females for the mating select those having long, broad, deep bodies which slope slightly from shoulders to tail, full, prominent breasts, low well spread tails, shanks of medium length, good substance and set well apart, strong necks of medium length and broad, deep skulls.

In surface color, the female should be an even shade of rich mahogany ground color over entire breast, back and body each feather ending in a black bar with a white tip.

There is a tendency toward peppering in the ground color of the feathers and this must be guarded against, although a small amount of this is not such a serious breeding defect as some people seem to think.

Under color should be slate or slate shading into salmon at the skin.

In wings I like to have the primaries mixed black and white, and the lower half or outer edge of each secondary feather a rich mahogany brown, and the upper half or inner edge of secondary, black. This kind of wing shows a beautiful brown when folded.

Main tail feathers should be black and white, a little more black than white, and the coverts black, tipped with white.

The male to go with these females should be a bird that is full of vigor and vitality and of not less than 9 lbs. for cock or 7½ for cockerel. He should have a long, broad, flat back which slopes nicely from shoulders to tail; a full, prominent, squared appearing breast, low well spread tail; shanks that are straight, strong and set well apart; large neck, of medium length; and a broad, deep head.

His color should be an even shade of dark rich mahogany over neck, back, wing bows and saddle, each hackle and saddle feather to have a narrow black stripe through the center of lower end.

It is desirable to have each hackle and saddle feather tipped with white, but do not be too particular about tipping in these

Step

for special circular on Summer sale of "FAMOUS" Ancona Stock

I have been a traveling man. For many years I hustled a grip, and how good the little home did look on returning at the week end!

Among my customers I number hundreds of traveling men—boys who "step lively" to make a living—boys who look forward eagerly to the few hours on Saturday and Sunday spent at home when giving attention to the flock of Anconas out in the back yard is one of the entertaining and lively diversions of the few hours spent at home.

Traveling men, retail salesmen, clerks in offices, workers in factories, school teachers, professors, professional men and farmers raise Sheppard's "Famous" Anconas—under conditions that vary from a dry goods box for a coop to an elaborate electric lighted, modern poultry house.

They all agree that "Famous" Anconas pay, and the reasons why they pay are set down clearly and backed up with proof in my illustrated 100-page poultry book, ready for mailing, and sent promptly to you on receipt of letter or postal.

"Step lively" with your request and I will send you a special end-o'-season price list on Ancona stock. Quick action is necessary if you secure some of this desirable stock at reasonable prices.

H. Cecil Sheppard

Box A422

Berea Ohio

President, International
Ancona Club

two sections, as males having very little hackle and saddle tipping will breed good stock. The thing to work for is the proper shade of ground color. One male having the correct shade of mahogany ground color and practically no hackle and saddle tipping is worth a dozen males that are nicely tipped in these sections but have the light red or sandy ground color.

As breeders, use those males whose under color is slate shading into salmon at the base in all sections. The breast, body and fluff surface color of the male should be the same as that of the back of the females. Wing color, same as that described for the females. Main tail feathers about equally divided in black and white, main sickles, lesser sickles and coverts greenish black tipped with white.

However, it is not always possible to have the main sickle feathers black, as is attested by the fact that some of the winning males in our best shows have almost solid white sickles. From such a mating as is above described one may reasonably expect to get a large percentage of good exhibition specimens of both sexes.

Now about picking out the promising birds amidst the young stock, and on this matter I write for the purpose of aiding the beginner with Sussex to properly select and develop his young stock.

Picking the chicks for color is a comparatively easy task for me, and begins as soon as the chicks are hatched and thoroughly dried. When taking off a hatch it will be noted that some of the chicks have rich yellow-colored bodies with a reddish cast on top, others will be a deep brown with stripes along each side of the back and still others will be very light in color, in fact almost white. This great variation in the color of the chicks is due to the fact that the Speckled Sussex is a tri-colored or three-colored fowl. If the reddish yellow and the brown chicks are leg banded or toe marked and their development carefully noted it will be found that they are the ones that will grow into the best colored fowls. This does not mean that none of the whiter chicks will be of any value in color, as usually there will be a few of them that will develop into nicely colored birds, but not any appreciable number. Occasionally chicks will hatch almost black and these will always remain too dark in color.

From this it will be seen that one may pick his Sussex chicks for color at a very early age. In fact, so early that some who read this may say it can't be done, but this is not an epistle to the unbeliever. I have followed this plan of selecting for color for several years, and found it satisfactory.

Picking for type requires a little age on the birds. The beginner should not attempt to select for type until his chicks are about twelve weeks old, although I have reached the point where I can pick most of those that will be best in type at a somewhat earlier age. If the chicks are closely observed it will be seen that some of them have long, flat backs, full round breasts and a considerable fullness below the vent. These are the fellows to select for type. The chicks that have slim bodies, flat breasts, long, slender legs and little body formation back of the legs never amount to much in type, and neither do those that have little, short "humped up" bodies. So much for selecting the birds. Now we come to the subject of feeding them.

When the chicks are forty-eight hours old give a feed of corn bread that has been soaked in milk and from which the excess moisture has been squeezed, being careful to give only as much of the feed as will be cleaned up in about 15 minutes. The bread and milk should be the only feed given the chicks for the first three days. After the third day a mixture of grain composed of one part corn, one part wheat, one-half part hulled oats and one-half part kafir corn ground to the fineness of coffee when ground on mother's old hand mill should be added to the ration. Feed the chicks four times a day, giving two feeds of the grain and two of the moist bread. Continue with this feed until the chicks are four weeks old, at which time you may discontinue the moist bread and substitute a bolied mash made up of one part corn meal, one part bran and one part rolled oats. You also should at this time increase the size of the grains in the grain mixture.

Any table scraps you have on hand may be added to the cooked mash and will be greatly relished by the birds. Provide plenty of green feed right from the start, and once a day give the chicks all the buttermilk they will drink, if obtainable. If you have no milk, add a little coarse beef scrap to the grain feed after the chicks are a month old. Grit, charcoal and clean water should

Lively

word goes out of special prices on "FAMOUS" Ancona Stock

Annually I add hundreds of new customers to our books during this end-o'-season sale of "Famous" Ancona stock. Annually many of my customers take this occasion to rejuvenate their present flocks.

A concession of at least 20% from regular prices is allowed during a limited time (see special circular), so as to reduce my stock to the point where it won't be necessary for us to winter several hundred surplus birds. In every respect each of these birds is up to the Sheppard standard of quality—thoroughbred from the top of their tails to the crimson red of their combs.

If you have received my catalog you have a clear idea as to what you may expect. If you haven't a copy of this catalog, I suggest you drop me a postal now—and please request special end-o'-season sale circular if interested. That's all!—but "step lively," please, if you take advantage of this special discount.

H. Cecil Sheppard

Box A422

President, International
Ancona Club

be accessible at all times. This constitutes the full feeding course from the time the chicks are hatched until fully matured. It is a method of feeding that is very simple and easy to practice and one that will produce results.

Now a few points on housing. Provide the growing stock with dry, well ventilated houses that are kept clean, free from lice and mites and well bedded. As the weather becomes warmer, use the coarsest straw obtainable for litter, and see that it is deep enough to hold the chicks well up off the floor so the air will circulate through the straw under them. Keep the birds off the perches until two-thirds grown, and thus avoid crooked breast bones.

Missouri.

John Miller.

R. I. REDS IN INDIANA.

The other morning as I lay sleeping I was awakened by the sweetest music in the world. The melodious strains of a Robin Red Breast's song, at daybreak came flowing through the open window of my room, just at the peep o' day. Not from one, but from hundreds; it seemed, did this wonderful music burst forth from the throats of these happy singers.

I had heard this serenade before, but never so sweet and complete as on this wonderful June morning. As the daylight came on, the music became softer and softer, and with the full flood of morning light, came the end of the Robins' serenade.

But this was not all. A mocking bird, and a wonderful singer he was, took up the singing, and from the top-most limb of a

wild cherry tree, out there in the orchard, poured out his soul in a glorious variety of musical notes, heralding to the world the dawn of another day.

I looked out the window and a beautiful sight met my gaze. Coming out of their colony houses and running swiftly across the green meadow were nearly 300 Rhode Island Red youngsters, all feathered out and all mine. They were running to and fro, as if in answer to the song birds' call to be up and doing, and their pretty red bodies against the green of the meadow in the soft morning light made a wondrous picture.

Out of this group of Reds, and some younger ones coming on, I hope to have some good enough for the Indiana State Fair, also the State Red meet at Indianapolis Feb. 8-12, 1922. It's a great privilege, this watching the youngsters grow and wondering which ones will finish with enough quality to grace a show cage at your favorite show, and still be good enough to catch and hold the eye of the judge, when he is making his last check for the winners.

You'll pick up a youngster today and he'll have about everything, and you'll mark him for one of your best prospects. A few weeks will go by and you will spy another, that is opening up and blossoming out like a flower, although a few weeks back you had tabbed him for the butcher, but a good comb or a good wing saved him; and now you are shaking hands with yourself, for he is losing that lanky shape, and that bit of smut in his back is turning a deep red, and he has every promise of developing into a star. So you watch and wait; maybe he does and maybe

he does not, but it's a lot of fun anyhow; and if we don't happen to get the bird of our dreams this year, we always have the satisfaction of knowing that there's another year just ahead, and we can put the matings together a little better and try again.

J. C. Johnston will judge the Reds at the Indiana State Red meet and the boys are mighty lucky in securing him as he is one of the best on Rhode Island Reds in this country today, always fair and square, and always judging the birds according to the Standard of Perfection without fear or favor. Whether you are a big breeder or little breeder you can rest assured that your birds will be placed just exactly where they belong. Another nice thing about Johnston is the fact that he does not mind taking a little pains and a little time in explaining different points to an exhibitor, and I feel satisfied that he will do all in his power to help us make this show one of great educational value from a breeding as well as an exhibitor's standpoint.

Harry Forbes.

Indiana.

Value of Shade.

Shade is an important factor in the proper development of the growing chick. That furnished by growing plants is the most desirable because they at the same time give off considerable moisture, thus affording a cooler shade than can be obtained in any other way. Artificial shelters are better than no shade and should be supplied if the natural shade is wanting.

WYCKOFF'S S. C. WHITE LEGHORNS AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain—unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S.C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that the WYCKOFF LEGHORNS have been, wholly or principally, the foundation of practically every successful Leghorn farm in this country for years. This is particularly true of the flocks making the most wonderful records.

HIGH QUALITY BREEDING COCKERELS

We are now offering the most exceptional lot of early hatched breeding cockerels it has ever been our good fortune to produce. These birds are all from a special selected lot of two-year-old hens of fine type, large size and wonderful layers. They are of a quality unequalled. Greatly increase the value of your present stock by purchasing some of these grand males for your next season's breeding—cockerels of this, the oldest established strain of Leghorns, and recognized by all poultry authorities as the best.

A limited number of fine selected yearling breeding hens and yearling cocks of equal grade left to spare. No more pullets of any age at any price this season.

OUR PRICES, CONSIDERING QUALITY, ARE EXCEEDINGLY LOW

Remember that we sell only QUALITY stock such as we would use for our own breeding. No second grade or bought up junk handled at any price.

As we are never fully able to meet the demand, advise that you place your order early. Send for free catalog giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country.

AURORA CAYUGA COUNTY NEW YORK

Blue Ribbon Silver Campines Stock for Sale

I am now booking orders for stock. Have a splendid selection of cocks, hens, cockerels and pullets for delivery. Your absolute satisfaction is guaranteed. I am especially prepared to furnish high class exhibition birds.

I have the largest plant devoted to the raising of exhibition and high egg-record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous.

I have had 62 males placed under ribbons at the Coliseum Show in last nine years. During the same period, I have had 147 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

Write me for information.

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

Exhibition Stock on a Back Yard Lot.

(First Prize Article.)

There are people of my acquaintance who are very fond of chickens but complain that they have such a small place there is no room to raise them, yet they have much more room for runs than I have, and with little trouble they could raise 50 chicks. But no, they have seen poultry farms where there were acres of ground and all manner of equipment, and had made up their minds that unless they also had the same thing it was useless to make the effort to grow good specimens in limited quarters.

I have been raising chickens on a small lot for many years and what I have done, you can also do if you will only give some of your time to the work, and not get discouraged,

especially if you lose some chicks, which you will do, no matter how careful you are. Find out the cause and start to work at once and you can stamp out any disease. In other words keep your medicine chest handy, but use it as little as possible.

Having always lived on a small lot I want to say for the benefit of the beginner that I fenced off a place about 10 feet wide and 40 feet long, put up a portable poultry house, and in this space I have raised White Wyandottes that have supplied us with an abundance of eggs and have won prizes at leading southern shows where they were from two to four thousand birds on exhibition. With the assistance of my two boys, ages eight and twelve, I conditioned these birds in my back yard and the only drying house they had was a dry goods box. You will no doubt say

it must have been a job doing this. Of course it was work and it also took patience, but after all what is worth while that is not hard to attain?

Now do not get the impression that all you have to do is to lay off your space, fence it in, erect a house, put chickens in the yard and everything will come to you. Not a bit of it. This chicken business is very much like the dairy business. In order to have stock and keep it right, you have to work with it, not only today and tomorrow, but every day and often at night; but after you have raised them, conditioned them for a show and find the ribbons on your cages, and incidentally receive a cup for the champion hen in the show, I tell you right now it thrills you with pride and makes all the work you have done well worth the effort.

I shall never forget my first show. Before deciding to exhibit I had several friends come and look over my stock and express their opinions. A few of them spoke favorably, but the majority were very discouraging, telling me I did not have a chance to win. I said little while they were here but when they left I told my wife I was going to send these same birds to the largest show in the South instead of a smaller one, as I at first

intended. And I did. I shipped them nearly a thousand miles, the first time they had ever been away. On six entries I secured four prizes, one being third pen, and by the way this was my first experience in matching up a pen, so it is plain that what I have done you can do, too, if you will only make up your mind to do it.

Now, a few words as to the breed you raise. Of course this is like your family physician, a matter of choice. There are lots of good ones but the one you decide on will of course be the best for you. When you make this decision do not buy foundation stock from any man just because he is a few dollars cheaper than the other fellow. If you have not sufficient funds at hand, wait until you have and then purchase your stock from the best breeder you can find, who has a good reputation. Such a breeder you can always find in the columns of the American Poultry Journal. If you can only get a few birds at first, let them be the best, and you will be able to raise stock from them that you will be proud of always.

I am a breeder of White Wyandottes and I want to say that I was not partial to this breed from the beginning, as I tried several varieties before settling down to the Wyandotte which won me solely on its merits as, "A thing of beauty and a joy forever." The first thing you usually hear against this variety is that they are so hard to keep clean unless you wash them. Well, you might say the same thing about your face, but in my opinion they are well worth the trouble of washing for exhibition and I do not know of any bird that can surpass them when in condition.

You may say what you please, but the human eye always has and always will crave a thing of beauty, whether it be a feathered chicken or any other class of live stock. Take the Wyandottes, their bodies like a ball of snow, combs as red as blood and legs a beautiful shade of yellow, turn these birds loose on a green lawn and they present a picture that the eye never tires of looking at. Then last but by no means least, they are excellent layers, fine mothers, very docile and easily kept in a small place, and for their size they consume very little feed.

I read an article some time ago by H. C. Sheppard, breeder of the famous Anconas, which I enjoyed immensely. It seems he was showing some friends over his plant and when they were ready to leave they asked him to what he attributed most of his success. He replied that he tried to live up to this motto in the chicken business: "It is 90 percent perspiration and 10 percent inspiration." This expresses it in very few words and the man who lives up to this is bound to succeed no matter whether he has ten birds or a thousand.

My chief object in writing this article is to try and give all the encouragement I can to the back yard breeder, the fellow who has the inclination but not the cash to branch out on a large scale; and let me tell you some of the best exhibition stock ever put in a show was raised in a small yard with a dry goods box for quarters. It is not so much where

You will never regret it.—Maredo Poultry Yards, Alabama.

Sulphur and Salt.

Second Prize Article.

It has been found by careful observation that the cause of feather-pulling, in most cases, is because there is a lack of some substance required by the fowl. When fowls are confined, however, and fed exclusively on grain, they often lack many substances, which are essential. Feathers contain sulphur, and at times it is required by the fowls in larger proportions than is supplied in the food—especially is this true at molting time, and while the fowls are growing new feathers. Great care must be taken that the sulphur is not supplied in too large quantities, and should not be allowed during damp weather, as it may cause rheumatism—having the same effect in the system as minerals, but during dry weather it may be used more safely.

The proper way in which to provide sulphur for the fowls is to place same in the mash. One teaspoonful of sulphur mixed thoroly in a quart of ground feed and slightly moistened is the right amount for 20 hens—this can be fed twice a week.

Feather-pulling is not noticed much among fowls that have free range and can have a balanced ration to suit their needs, but fowls that are closely yarded and must have all their food supplied, great care should be taken to see that all their requirements are provided in the way of grit, oyster shell, ground bone, beef scrap, clover, alfalfa, green feed, sunflower seed and various other small seeds also largely assist in balancing the ration.

Feather-pulling is one of the worst habits that can develop among yarded fowls, and if allowed to go uncorrected will, in a short time, destroy the flock. When a bird begins to look as if it were picked on the neck and breast, you may then begin to watch for the hen that is doing the mischief. This hen should be removed at once, as she will teach the habit to others, if left with the flock.

Provide plenty of clean, deep litter, and scatter the scratch grain so that the fowls will be busy the greater part of the day; this will prevent the idleness that comes from close confinement. The fowls will be healthy and contented, and feather-pulling will not be known in your flock.

Fowls require salt in their ration the same as do people and animals. But only a little is needed—not more than one-half teaspoonful a day to a flock of 50 to 75 fowls. Too much may be more harmful than too little, and since fowls often do not know when they have had enough of it, we dare not place the salt before them and let them eat all they want, as can be done with farm animals. It is,

therefore, best to mix the salt with the mash.

Those who use the ready prepared standard laying mash put up by the different feed firms over the country will find that in most cases the salt has been added to the mash. This will be noted by the ticket giving the formula which will be found attached to the bag. If, however, the mash contains no salt, it would be well to add fine salt at the ratio of one-half pound to 100 pounds of mash. Salt seasons the food and gives it a palatable taste as well as proving a benefit to the fowls.

Rock salt cannot be allowed poultry because they will indulge to excess, causing salt poisoning. Salt in the food agitates the desire for drinking water. When we consider that from 70 to 80 percent of the composition of eggs is water, the importance of supplying salt and keeping fresh, clean water constantly before the layers is very evident.—C. F. Stem, New York.

Summer Care of Chicks.

By W. W. Kulp.

First you must have your chicks. They should be of healthy, strong stock, properly hatched, altho I have come to the conclusion more depends on proper handling after hatching.

Some years ago I had a poor, three-tier incubator. I could hatch with it if I would start the eggs ten days under hens, then transfer them to the machine and give the hens fresh eggs. If I put the eggs in the incubator at once I would get but few chicks, but by having the hens do the first half of the job, I could get good hatches. Amongst the lots of chicks hatched were 24 Banded Rocks. They looked like spiders; small and very little on them. The eggs must have been too hot. I never saw a lot like them and thought they surely would die, but by proper care all lived.

If chicks are taken from the incubator too soon, they are very easily hurt. A little chilling will put them out of life, while if fully ready to eat they will stand considerable risk.

From middle of May on for latitude 40, shade is the safest place by far, altho the morning sun is quite good for another month. I saw a whole brooder full killed by putting the brooder in the sun the last of May. The chicks were nearly all dead when I discovered them, and what were living were trying to get in the little available shade which was offered by a foot wide board, used to make their pen. A few minutes of inquiry of an experienced poultryman would have saved them.

Any kind of shade is good, but chickens seem to like bushes best. It is like hiding, and the ground is cool under the bushes. They should have as near free range as possible where green things are growing. Green food is full of vitality. It also keeps the blood pure and clean. I think the greatest benefit of green food is the vitalized juice of sun grown plants.

Freedom from lice is essential, both body lice and mites. If the chicks are hen hatched and any body lice have been on the hen they will nearly

SQUAB BOOK FREE

Squabs are selling from \$12 to \$18 a dozen, highest prices ever known. Great demand, small supply. Big profits. Start now. We sell the famous Plymouth Rock breeding stock and supplies. Squabs are raised in one month. No mixing feed, no particular labor, no young to attend. For prices and full particulars see our free book, "How to Make Money Breeding Squabs," Plymouth Rock Squab Co., 321 Howard St., Melroe Highlands, Mass.

THE LEGHORN WORLD

Devoted exclusively to all varieties of Leghorns. Published monthly. One year 50c, three years \$1. Official organ of all Leghorn clubs.

THE LEGHORN WORLD
1031 E. Bremer Ave. Waverly, Iowa

all move onto the heads of the chicks the first 24 hours. And it is often the salvation of the brood to apply a little grease to the top of the head of each chick.

Mites will show themselves in the coop by whitening the cracks. If a few are taken to the brooder they soon become very plentiful. Chicks will then all die.

The next is the feed and water. Water they must have, and if you have skimmed milk, give them enough daily so that it will last over half the time. If you do not have milk, meat must be supplied. It may be given in the mash or fed in hoppers. I like the feed to be 200 percent animal protein supplement or 100 pounds beef scraps to 400 pounds of other grain feeds.

If you are raising your chicks in yards without green food under foot, and they are breeds with color in their feathers, it is absolutely essential that they be supplied with all they would get on a free range. That is, grass, milk or meat, and the three main kinds of grains, wheat, oats and corn. And see that they have plenty. Better by far to keep it before them all the time, than not enough. If the varieties you are raising are black breeds or Brown Leghorns and you do not supply what they would get on free range, you will have white in the wings every time. And no breed will feather up clean and bright without the varied diet of greens, meat, and grain.

I have seen more chicks stunted by too little food than not enough food. If after doing what you think is the best your chicks are not doing as well as they should, ask a poultry woman who is near by to look them over. They can often see by surroundings what is wrong. And don't be hurt if they tell you, "not enough feed," although it may seem to you plenty when it comes to paying the feed bill. And be sure the care is every day.

Chicks during the hot weather always grow slower than during the cooler months. If they look healthy and bright during the hot months, July and August, you are doing well. When the cooler month of September comes, push the growth as much as possible, so they are well grown before the severe weather comes.

One mistake that I have seen made over and over again is to leave the broods in the coops too long. As soon as any brood is thoroly feathered they are far better off if the coop is turned upside down and the chicks roost on top of it. Or better still, if they can go in a tree, they are freer from danger from prowlers in the night, both four and two legged.

Chicks in the coop become very warm. In the morning when it is cool they come out in an over-heated condition, and very often take cold. The cold then develops into croup.

Last fall I was called to inspect a flock of Reds that were two-thirds grown. They were in about a dozen coops scattered on a bank. Each coop was literally packed full of chicks. I found three smothered chicks. This can be avoided by turning the coops upside down.

Brooder for 50 to 100 chicks

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I am 61 years old, and when I go South I feel quite well. I have 25 acres of good unimproved land near Waycross, Georgia; also 40 acres of citrus land, unimproved, in Hillsboro County, Florida, near Tampa. Do you think it would be advisable for me at my age to move to one of these places and raise poultry and fruit. I could raise about \$6000.00 in money and both pieces of land are fully paid. Would poultry be profitable at either of these places? What kind of fruit would be best grown on the land in Georgia? It is a deep sandy loam, and I have seen fine Pecan nut orchards in the vicinity of my land, also peaches and other fruit. In Florida my land is in the neighborhood of large Orange and Grape Fruit groves and truck farms. I have raised poultry successfully in Ontario, Canada, not far from Toronto. I have property about 65 miles west of Toronto, Ontario, but the winters are too cold for me there, and I suffer with rheumatism when there. I have here a salary of about \$2500.00 per year, but office work seems to affect me.

Canada.

L. P. Jones.

With your capital you could very nicely plant your land in either Georgia or Florida to fruit, and construct the poultry houses, yards, etc. I would prefer the Florida proposition. Your health ought to be the first consideration. Then too, you must consider the matter from all points in a business way. Your land in Georgia is not in the Georgia fruit belt proper, although Pecans (nuts) do well there. Your land in Florida is favorably located. The fact that this land is in the section where there are many successful Commercial Grape fruit growers indicates you may plant Grape fruit trees. The combined fruit and poultry farm in Florida is a very profitable undertaking.

* * *

In writing a personal letter Prof. F. H. Stoneburn, New York, adds this note, which, I am sure, will be of much interest to the readers of this department:

Lots of things can happen to chickens, but you'll hardly have them hit as bad as the fruit was last year. Eastern Tennessee and Western Virginia are pushing the poultry crop hard.

Just back from two weeks spent in Tennessee and Virginia. Fruit situation very discouraging. Practically everything in blossom when the big freeze came along and the general belief is there will be no commercial crop.

In the big apple section of Virginia, the Shenandoah and Virginia valleys, the crop seems to be practically 100 per cent ruined. I examined some orchards. One big tree that I went over carefully, a tree that was simply loaded with blossoms, had only two little apples that I could find. Many of the leaves were frozen and curled.

* * *

Am much interested in your description of western North Carolina and am writing you for some information. Is this country suitable for turkey raising. Is it near good markets? What I want is to find a place where they do not have much cold weather and one suited to turkey raising. Can one find little ranches in the mountains?

Wyoming.

Mrs. L. M. M.

Western North Carolina is ideal for the profitable raising of turkeys. Every condition there seems to fit in with the requirements of turkey raising. The climate is ideal, there is plenty of range, wooded and otherwise, land is cheap, comparatively, the markets are good, and the shipping facilities, to the large eastern markets, all that could be desired.

ed.) Yes, ranches can be bought up in the mountains. I have urged turkey raising in that section for years.

* * *

First we have a 40-acre place in the hills of Sharp County, Arkansas. It is an ideal place for raising chickens, turkeys, etc., but the roads to the railroad station are bad and market poor; the local market is the usual country store, and the train schedules are such that if chickens, etc., are shipped to Memphis (it is the nearest market and is not a really first class one), they are on the road so long they lose all the profit in weight. All grain has to be bought as the hills won't grow it. In fact this entire section is a poor proposition for the commercial poultryman as well as I can judge. I had thought of going east this winter or late in the fall to Baltimore, Mr. As I am familiar with that section, having lived there for some time, in the city. I think it a better market for eggs, turkeys, geese, etc. Although if I go I will have to rent for a time, as I cannot buy a place for what I can get for my Arkansas place, and would have to pay a pretty stiff price for a place there. What I would like to know, and have the advice on, is whether a practical person thinks the difference in price of poultry products would justify the move? I have three fine Holstein heifers I would like to take as owing to conditions of the cotton market here money is very scarce and I could not sell them for very much and yet

I could not replace the same quality for a small price. I also have my poultry (bred to lay stock), turkeys, geese, ducks, guineas, etc., that is the breeding stock, to move. It would cost me at least \$250 to reach Baltimore or more. The roads are so bad at Williford, Ark. It is practically impossible to sell hatching eggs as, no matter how carefully they are packed, they break. It seems a little risky to sell a place fully paid for and have to rent and take chances on making good on a rented place. But at the same time we are both middle aged and feel we ought to go where we can make the most for the time we can work, as we want a competency for our old age. All our friends are east. The stores here seem to all have the same price and will scarcely pay anything for produce of any kind, but sell high. They quoted me price of 45 cents per dozen on eggs and were retailing them at 80c, a price of 35 cents and were selling them at 65 cents. Turkeys at 23 and they were selling them at 63 cents per pound; butter 25 cents and retailing it at 55 and 60 cents. We specialize in early broilers, hatching and market eggs, Christmas turkeys and geese; sell young ducks and guineas on a small scale; sell cream or high grade butter, using milk for chickens, etc.

Arkansas.

M. L. Etzel.

I wish I was wise enough to settle this problem for this woman and her family—to be able to so advise them that they would be certain of that happiness and prosperity which means an independent and peaceful life. It does seem that there is not much promise of acquiring a competency on the farm they now occupy. That they sell at a loss and begin anew in a new section? That is an important question.

It would appear that the best thing to do is to take the step. The section of Maryland, near Baltimore, is especially adapted to fruit and poultry raising and dairying. The market is good. I am of the opinion that there is a better opening for these people in the vicinity of Knoxville, Tenn. I consider this one of the most favorable sections in all the U. S. for poultry and fruit raising and dairying. I advise my correspondent to make an investigation of that section.

I am a married man with three children. I intend to buy a little farm for poultry raising. I intend to make a business by selling eggs, before I start to do anything I would like your advice. How many hundred of chickens, and how many acres of land do I need to make my living. We will be glad for any advice.

Illinois.

Gim Bette.

Why not plan on a combination farm—fruit, a few dairy cows, a few hogs and the poultry as a leader? It is in these combination farms we find the profit and the safety. It is upon such a farm that ideal living conditions are found. It could not be otherwise for it is in the eternal fitness of things. No, we cannot answer your question as to the number of fowls one should keep to conduct a profitable poultry farm. That depends upon many things—one's ability as a poultryman, one's mode of conducting the business, the location and the markets—and a hundred and one other considerations.

* * *

Bought 6 acres in St. Clair County, Ill. Have a strip 60x750 and want to set it out in fruit. Please give me varieties of small fruits, strawberries, gooseberries, etc. Have 200 foot front which I want to set out in Pecan trees. Don't want to waste any space on shade trees. Could you give me any suggestions on using Stark's nut trees for shade?

Illinois.

P. Rolfe.

Advise you to plant Senota Dunlop, Haveland, Gibson and Sample strawberries, also Oregon Champion gooseberry and Fay and Red Cross currants. Royal Purple and Cumberland raspberries. You will find but few Pecan trees which will be suited to your climate. Stark Bros. will fully and correctly advise you as to varieties. Write them.

* * *

I am thinking of buying 12 or 15 acres of land in the Shenandoah Valley of Virginia, in Rockingham County, Virginia. Want to raise poultry, fruit and truck. I intend to have about 300 S. C. W. Orpingtons and 300 S. C. W. Leghorns, about 2 acres in fruit. What kind of fruit trees would you recommend for that part of Virginia. I am going to have some Honey Bees as a side line. Do you think I could make a living on 12 or 15 acres for myself, wife and her brother, as my wife's brother will help us. I know the poultry business thoroughly and have taken one of Prof. T. E. Quisenberry's best courses.

I also have a chance to buy 15 acres in north Carolina, near Asheville, and I understand that is a very healthy climate. Do you think it would be a good climate for one afflicted with a cough? My wife has a cough and this is why I want to make a change. Went to New Mexico but this did not help her. This country is too cold in winter. We must get into a milder climate. Is the climate of Virginia and North Carolina mild? I had a poultry farm in Florida once but had to give it up. I sank a nice fortune there.

Kansas.

J. A. May.

Yes, I feel sure you can make a comfortable living on 15 acres of land in Rockingham County, Virginia. Many people are doing this very thing in Virginia and elsewhere. For that size farm I would prefer that location to the vicinity of Asheville, N. C. Advise you the plant Delicious, Stayman and Golden Delicious apple trees. Poultry, fruit and bees make an ideal combination.

* * *

Now I am figuring on buying ten acres in the Shenandoah Valley of Virginia in Rockingham county, one mile and a half from shipping point. I want this ten acres for fruit, poultry and truck. I also want to raise S. C. White Orpingtons and S. C. White Leghorns. Now what do you think of that part of Virginia and what kind of fruit would be best for that section? I want peaches, plums, apples and cherries, also grapes. Do you think I could support myself and family on ten acres after I got started? Please give me

An Electric Ride Over The Great Divide

For six hundred and fifty miles mighty electric locomotives using "White Coal" for power haul the "Olympian" and the "Columbian," the luxuriously equipped trains of the Chicago, Milwaukee & St. Paul Railway through America's scenic wonderland—across the three mountain ranges of the Continental Divide, and through the Cascades.

The comments of Thomas A. Edison summarize most accurately the impressions of many travelers over this popular route. He says: "No grinding, no jerking, no puffing, no pulling, no straining, no disturbed slumbers—just a keen sense of moving swiftly, of being propelled by power vastly in excess of requirements. You ride with ease—it is the very last word in transportation."

Travel over the World's Longest Electrified Railroad on your next trip between Chicago and the Pacific Northwest.

your answer on this if it not asking too much. What do you think of keeping bees as a side line?
H. M. M.

Kansas.

That portion of Virginia to which you refer is certainly blessed with wonderful advantages. The climate is ideal, the land fertile and the people there are real, there are no better people in all the world. The following fruit trees are best suited to conditions there: Apples—Delicious, Stayman, Golden Delicious and Virginia Beauty; peaches: Stark Early Elberta, J. H. Hale, Elberta and Krummel; plums: America, Abundance, Terry, Omaha and Surprise; cherries: Montmorency; grapes: Magara, Delaware, Moore's Early, Worden and Concord. I think ten acres properly handled as you have outlined your plan, will nicely support you and your family. I want to hear from you again sure and keep in touch with you on this undertaking.

The Mahogany Russian Orloff.

By Dr. M. A. Hansen.

The Orloff is really the National fowl of Russia. The first accounts we have of its origin dates back to 1774. Sufficient data is available to show that the origin of the breed came through one of three sources, and that the Orloff owes much of its fostering care to Bailiwick of Orloff in the former Russian government of Wyatke, or the sporting Count of Orloff should be credited for its production, or the Russian Admiral Orloff, who strangled Peter III, originated this breed.

These birds are as large as a Rhode Island Red and as near a non-sitter as a White Leghorn, and the only chicken I have ever eaten with a turkey flavor.

I have had these birds in both the National and American egg-laying contests and they have shown themselves to be egg layers of exceptional ability.

My two-year-old hen in the American egg-laying contest was at the head of all other birds at the seventh month and up to the time of her death, during the hot weather in Kansas.

I do not recommend these birds for one living in a hot climate, but for those in the North who have dealt with frozen combs, no bird can begin to compare with them as they have no wattles or combs to freeze. They are hearty and different from all other breeds and are decidedly out of the ordinary. As an experiment I have kept a number of these birds in a cold building which was entirely open and at times the thermometer was thirty below, still they kept on laying, though not so well as if they were housed.

The Orloffs were originally bred in several colors. Not until late years has any effort been made to standardize on color.

My selection is the Mahogany colored Orloff and I have improved their color wonderfully. The head of the Orloff is distinctive, being very round. The beak is slightly curved, eyebrows overhanging like those of a Malay. Their particularly characteristic comb—so-called "Strawberry"—a neat, close-fitting comb of very small size—in fact is frost proof. They are clean legged, non-sitting and will enjoy a distinction of being an ideal fancier's fowl. I find them especially adaptable to limited quarters and yet they can hustle over an eighty-acre field if desired.

The cock of the mahogany variety is a most wonderful colored bird. The neck hackle is rich deep orange, blending into brighter hues of gold at the base. The muffs at the throat are mahogany or almost black. The breast and under parts are mahogany, tipped with glossy greenish black horseshoe markings. The saddle matches the neck hackle, the bows being a rich mahogany red. Wing bars are magnificently bronzed showing a purple hue of bright lights.

In general appearance the hen is similar to the cock in body except longer and coloring is less intense.

The Orloff is somewhat of a bizarre in appearance and cannot fail to appeal to those

Invest in the best

standard bred poultry. Thirty years as a breeder is sufficient evidence of my reliability. Every bird on my farm has been "Hogazined," trap-nested and pedigreed to keep up their average as 100 percent producers.

SUNNYSIDE PULLETS

8 TO 10 WEEKS OLD

are the very best investment it is possible to make—this you will realize next winter when they produce every day when egg prices are high.

Prices. 180-200 egg-bred, \$1.25; 210-248 egg-bred, \$1.75; 240-256 egg-bred, \$2.25. Sixteen weeks, \$2.25, \$2.75, \$3.25. Hens as above records, \$2.25, \$2.75, \$3.25. Cocks, \$5, \$10, \$15.

who love the uncommon. They are unlike any other breed that Americans have seen.

The British Standard.

Shape (Male and Female)

Cock.....8 lbs. Hen.....6 lbs.
Cockerel.....7 lbs. Pullet.....5 lbs.

Head—Of medium size, forehead wide.

Beak—Short, stout, and well-curved or hooked.

Eyes—Full, and deeply set under well-projected eyebrows, giving gloomy, vindictive expression.

Comb—Low and flattish. In shape somewhat like a raspberry cut through its longer axis, and covered with small protuberances, mingled with small, bristle-like feathers, this peculiarity being particularly noticeable in the female.

Wattles—Small, and show only in the male.

Ear Lobes—Very small, and hidden under the muffings in the mature bird, red in color.

Beard and Whiskers—Well developed, especially in the female.

Neck—Fairly long and carried erect. Very heavily hackled, swelling out so as to form a spherical protuberance, the feathers lying close to the body at the base of the neck, so that the neck appears much thinner here than at the top, and forming a distinct angle with the back.

Body—Broad, with flat, slightly sloping back, and rather full and prominent breast. The female is apparently longer in the body than the male.

Wings—Moderate and carried closely to body.

Tail—Carried erect and fan-like. Tail of male furnished with narrow but long sickles. Tail of female comparatively long.

Legs—Moderately long and stout.

COLOR OF MAHOGANY MALE.

Beak—Yellow, with a thin rose-colored skin at base of beak and nostrils.

Eyes—Red or amber colored.

Face, Comb, and Wattles—Red.

Head and Neck—Rich dark oranges, darkest at the crown of the head, and showing very slight black stripes at base only.

Beard and Muffings—Mixture of black, mahogany and grey, grey preponderating.

Saddle—Rich mahogany, shading to deep orange.

Wings—Rich deep mahogany, with a strongly defined greenish black wing bar.

Breast—The nearer it approaches a solid black the better.

Tail—Black, with a rich greenish sheen.

Legs and Toes—Rich yellow.

COLOR OF MAHOGANY FEMALE.

Beak—Yellow, with a thin rose-colored skin at base of beak and at nostrils.

Eyes—Red or amber colored.

Face and Comb—Red.

Beard and Muffings—Mixture of black, mahogany and grey, grey preponderating.

Neck—Mahogany, lower hackle feathers showing black striping.

Tail—Mainly black.

Legs and Toes—Rich yellow.

Plumage—Rich dark mahogany, uniformly peppered with black. The entire absence of black or heavy and irregular black splashes are equally undesirable.

I would make one suggestion for the American Standard and that is that we eliminate the black breast on the cock and produce a straight mahogany colored bird in this way it will be much easier to produce the straight mahogany female.

They will do all we claim and more in the hands of the intelligent American fancier.

Chinese Eggs.

(NOTE: The tariff which is now before Congress carries a schedule of 6 cents a dozen on eggs in shell and 15 cents a pound on dried eggs. Professor Rice is doing good work in endeavoring to get these import duties increased. In this connection the following article from the Chinese side of the Pacific will be of interest. It has been prepared at our request by the Bureau of Economic Information, Republic of China, Pekin.—F. L. P.)

The hen is laying golden eggs for many farmers in China, for whereas before eggs became an important item in the export pages of the custom reports, one could buy them for almost nothing, they are now constantly

1000 Eggs in Every Hen

New System of Poultry Keeping—Get Dollar A Dozen Eggs—Famous Poultryman.

TELLS HOW

"The great trouble with the poultry business has always been that the laying life of a hen was too short," says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through cold winter months when eggs are highest; triple egg production; make slacker hens bustle; \$5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how, if you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 860A, Tyne Bldg., Binghamton, N. Y., and a free copy of "THE 1,000 EGG HEN" will be sent by return mail.

No Doubt About It! Bartlett's S. C. White Leghorns DO PRODUCE THE EGGS

Standard-Trapnested-Pedigreed, and bred to fill the egg basket day in and day out.

HERE IS YOUR CHANCE!

Eight and ten week pullets and cockerels for immediate delivery. Get your share of eggs this Fall and Winter. Also some fine breeding stock for sale at a low price to make room. Write for information.

going up in price. This rise in price does not affect living conditions in China as seriously as one might imagine, for the Chinese people are not large egg eaters. Rice and water make a much better breakfast than ham and eggs for a Chinese. As a matter of fact, ham and eggs would probably give him indigestion. The suggestion then that the famine sufferers should be fed on eggs which has appeared in some American newspapers is not altogether a good solution of that problem. What they need is not eggs but money, with which to buy wheat, millet, rice, etc. That is the food they are used to eating and they can no more change their diet and remain healthy than an American could subsist on sharkskins. Of course, this does not mean that the Chinese do not eat eggs. He does. But he would prefer to export them to those who like them better and need them more.

The value of the trade in eggs to China can be ascertained from the fact that nearly four per cent of the American imports from China in 1920 were dried and frozen eggs. The egg business was developed in China largely by American firms who were seeking this commodity to supply the demands of American bakeries. As a result of this stimulus a very husky, but infant, industry has grown up in China which is becoming more important every year, but which, of course, will suffer a serious setback should the United States decide to keep the commodity on this side of a tariff wall. The Chinese have had some experience with walls themselves, and know how harmful they are to those on both sides.

A list of egg factories in operation during last year in China gives 85 factories.

There are many more small factories. But it will be seen that of the principal ones, more are owned by Americans than by other nationals. Most of the factories which use modern machinery use American machinery, which means an increase in the general trade between the two countries and is sound economics. A list of the principal exporters of egg products gives America the lead:

American	17
British	10
Japanese	4
French	4
Danish	2
Belgian	1

When it is remembered that there are 413 American firms in China as against 644 British firms and 4,878 Japanese, it will be seen that America's lead in this particular commodity is unique and must be the result of an especial effort on the part of Americans to specialize in this field. The industry has been built up then through Americans and the stimulus was given to it by the American market. To shut it out of the American market would mean to destroy the industry, unless certain markets now closed in Eastern and Central Europe required this commodity.

A Japanese official estimate places the total number of hens in Shantung at 15,000,000 and estimates the total annual production at 126,000,000 or 84 eggs per hen. In a normal year about 75 per cent of this number is exported.

With regard to the sanitary condition of Chinese eggs American firms can obtain authentic information from the Bureau of Foreign and Domestic Commerce. An investigation has been made here by American inspectors and they are reported to have passed a favorable judgment on the Chinese product. The American government maintains a Health Service in China and it would be impossible for impure products to be shipped. The Chinese chicken does not feed differently from chickens anywhere else. There are few if any large chicken farms in China. Each peasant owns a few hens whose eggs he sells to a local egg buyer, who in turn sells to a contractor, who gets the product to the agents of the exporting firms. The hen lives in the farm house or near it, as hens do on most farms which do not specialize in this particular commodity. With regard to the conditions of factories, the importer has to depend largely upon the reliability of his shipper. However, there is an inspection of cargo in China by an American official before it can be shipped and therefore there is an assurance that the eggs leave China in a condition within the purview of the American law.

Shoemaker's Poultry Book and Almanac for 1921

Send for it NOW!

The book has about 200 pages, with many colored plates of fowls true to life. Tells all about chickens, their care, and diseases and remedies.

It also tells all about incubators, their prices and operation. All about poultry houses and how to build them. It's an encyclopedia of chicken. You need it. Only 20 cents. Your money back if not satisfied.

Eggs at Summer Prices Now

Proved!-That the Wishbone SAVES MOST SPACE

WHATEVER claim may be made for "freak" incubators, it is a positive fact that with the three deck Wishbone Mammoth more eggs can be hatched in a given space than in any other incubator made. The Wishbone saves you most space when you use it, just as it saves you most money when you buy it, and saves most cost, labor, and time when you try it. It is truly the "money-making mammoth."

There is only one standard, time-tested, sure mammoth. It is the Wishbone, the only incubator in which the eggs never have to be touched after they are first put in. The Wishbone has all these conveniences and, besides, hatches chicks with the least labor, least expense, least space, with absolute safety.

Prices Reduced To Almost Pre-War Level

Increased volume—lower cost of materials—save us money in making Wishbones. We've figured all our savings for the season, and we're handing you all the benefit of them.

Wishbone prices have been radically — generously reduced for the season. They are down to absolutely rock bottom—they make Wishbone positively the lowest-cost machine on the market. Write for new price list.

Write for Wishbone catalog with interesting incubator information—prices will amaze you.

American Incubator Mfg. Co.

106 Water Street

New Brunswick, N. J.

A Challenge

Many wild claims have been made by some manufacturers about the egg capacity their machines can give in small space. We challenge anyone to show us any space in which a Wishbone will not give more capacity than any other incubator made.

AMERICAN POULTRY JOURNAL PUB. CO. 523 Plymouth Court Chicago, Illinois

KEEPING A RECORD BOOK.

A record book for poultrymen is one essential that few realize the value of. So few breeders keep any kind of record of their chickens, what they are doing, what they are costing, and what they are profiting, yet that is one essential seldom overlooked in any good business in the towns or cities. Perhaps I am mistaken in the number of people who do keep a record, but I dare say less than 10 percent of the people who raise poultry have any definite idea of what they are putting into the business and what they are getting out of it.

Now as to the record, I started a record book Jan. 1, of this year. In this book I have a page for the egg record for each month. Under this entry I have a line for each day of each month and this line is divided into five parts. I now have three breeds of chickens and there is a small place for each breed where I put the number of eggs gathered every day. That takes three spaces; then I have a small space for setting down the kind of day whether hot, cold, rainy, or fair, etc. Then the fifth space I use for the total number of eggs gathered during the day. From this I can sum up the total number of eggs from each breed for each month at the end thereof, and the grand total from all of the breeds.

Then on the opposite page I have spaces for the sales during that month of all the eggs whether market or setting and prices and dates of sale, likewise of sale of all chickens.

I do not have a space for feed costs, as I have agreed to furnish the family with eggs and chickens to eat, which pays for the feed I use. However, this is a very important part of a record book for any one living in a town or city and trying to raise chickens or for anyone living on a farm and buying feed. I do have a space for expenditures where I enter the date and sum paid for any improvement or any more chickens.

Then I also have a space where I enter the number of eggs set, then the number hatched and the date of the hatch. This record book is an old ledger of my father's and did not cost me anything. It only takes a few minutes at noon (if you gather the eggs twice a day) and a few more at the end of the day to make all entries for the day. Though this was a new thing for me, I have only failed to keep the number of eggs gathered for about ten days since Jan. 1, so I have a good knowledge of how many eggs my chickens lay also, I can look back and see the number of eggs sold and price and date for same. Try keeping a record book so you will have the satisfaction of KNOWING what your chickens are profiting you.

Texas. Mary McClellan.

Fall Hatched Chicks.

I have heard and read considerable about Fall hatched chickens. After two years of success with chicks hatched at this time of the year, I have something to say in their favor.

Two years ago was the first time we ever hatched after May 15th. We hatched on September 10th, 85 S. C. White Leghorns from 120 eggs. These chicks were raised in a colony brooder, fed dry mash, scratch feed, buttermilk, and water. They were let out in a small yard after the second day, and the seventh day were given free range. We

have found that Fall hatched chicks consume very little feed as they have lots of bugs and weed seed at this time of the year.

These birds were hatched Sept. 10th and we got our first egg Jan. 25. They were all laying by the 1st of February, and were still laying when we sold them late in the summer.

We believe that chicks hatched in September will prove good layers, as the dam must be a good layer to be laying in August, when most hens are molting.

Last year we hatched 250 Leghorn chicks from 360 eggs August 20th. We put these chicks in a 10x10 ft. colony brooder. There was always plenty of dry mash and scratch feed inside the brooder, also water and buttermilk. They had free range of the Apple orchard after the fifth day, and we lost only seven chicks, which were weaklings and died when three or four days old.

They did not have any artificial heat after they were 25 days old. This may seem unbelievable, but we had dry, warm weather that made it possible. They were as wild and healthy as prairie chickens, they were gone from the brooder all day, but all were back at night, and spread out on the floor when the sun went down. In the morning they were 25 days old. This may seem unhollering to get out, which is not until the dew is quite gone, about 9 o'clock.

With the little care and attention that is required to raise September hatched chicks, we advise every poultry man who is short of stock this season to make a August or September hatch thereby you will get pullets that will lay in February and broilers that will bring the highest market price.

No young bird should develop scruffy legs. Never set a scaly leg hen and this obnoxious trouble will not be communicated to her chicks when they nestle under her in contact with her infected legs.

A Boost for Sicilian Buttercups.

Noah Webster said: "Utility means usefulness and intrinsic value," and that "intrinsic, means real or genuine." You will therefore find Buttercups utility as well as fancy poultry, for they are both useful and of real or genuine value.

They are by no means a new creation, having been bred in Sicily so long that their origin has been lost in past ages. In Sicily and Southern Europe they have been kept for their egg production and table qualities alone, and without any consideration for their plumage. For this reason it has been somewhat hard to get the desired plumage, but the desired inherent egg-laying quality in the breed is about as hard to lose as it is to get proper plumage. Since the poultrymen of America have taken hold of them, they have been bred with a definite standard in view, as fostered by the American Buttercup Club with a large membership in every state in the Union and Canada.

They lay a good sized egg and plenty of them, so I have nicknamed them "Egg Machines from Sicily." Buttercups, like other Mediterraneans, begin to lay about one month earlier than the heavier breeds. Their quiet disposition is a big asset in their egg-laying qualities. They are more docile than other breeds of the Mediterranean class.

They have yellow skin; are small boned in comparison with most breeds and will dress a greater percentage of meat than the heavier, large boned fowls. They are hardy, great hustlers and light feeders. I have been keeping them on two thirds the amount of feed of any other breed I have handled.

The little chicks with their "black velvet" splashes are exceptionally pretty; and

when several weeks old, until they get their second feathers, resemble very much young pheasants or quail.

The male has a rich orange surface color with black tail feathers and sickles. The female is a golden buff with black spangles over most of the body surface. The tail is dull black, mottled with buff.

Their peculiar color markings make them very hard to locate by the wiley hawk. The comb, from which the breed derives its name, is a distinctive feature of the breed and might be roughly described as resembling the buttercup of our meadowlands. It starts with single leader and opens into a cup shape crown comb, with medium size points, well balanced on the head.

Give the breed, with their practical egg-laying ability, a fair trial alongside of any, and with the right kind of treatment, you will be glad you became acquainted with the Buttercup.

The American Breeds of Poultry

By FRANK L. PLATT

This new book, published 1921. Up-to-date in all particulars. 256 pages. 100 illustrations. Printed on enameled paper. Bound in brown cloth. The most elaborate and costly book we have ever published.

This is the only exclusive work ever offered to the public on the great dual-purpose breeds that have been made in America by the genius of American breeders. An entirely new text, in which the author goes back to original sources, and starting at the beginning writes a history of the American breeds, tells of their origin and traces each step in their development. Every detail on the proper mating of each variety is given in a plain, practical way.

M. L. Chapman, manager of the great Wilbartha Poultry Farm, writes: "I think this book is away ahead of any similar work I ever read and intensely interesting. If I could have had some such similar book twenty-five years ago, I would have been winning at the Madison Square Garden Show a great many years earlier."

All you want to know about Barred Plymouth Rocks, White Plymouth Rocks, Buff Plymouth Rocks, Partridge Plymouth Rocks, Silver Penciled Plymouth Rocks, Columbian Plymouth Rocks, Blue Plymouth Rocks, Black Javas, Mottled Javas, Black Giants, Buckeyes, Missouri Fluffs, Silver Wyandottes, Golden Wyandottes, White Wyandottes, Buff Wyandottes, Black Wyandottes, Partridge Wyandottes, Silver Penciled Wyandottes, Columbian Wyandottes, S. C. Rhode Island Reds, R. C. Rhode Island Reds, Rhode Island Whites, Dominiques. Full details on breeding for meat and eggs as well as all Standard points.

Only a few of the general subjects are: Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualifications of a breeder; Work of the breeder; Building a strain; Inbreeding; Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting. No matter what breed of chicks you raise, whether English, Mediterranean, or American, you will learn much to your advantage.

Hens vs. Cows.

The Business hen is the rival of the dairy cow. The cow must be milked at regular intervals and the hen milks herself, so to speak. The product of the cow is exposed to all manner of microbes that float in the air of the even clean stables or adhere to the pans and bottles. The product of the hen is put up in capsule form. Both milk and eggs contain the important vitamins which science has lately discovered are necessary for growth—a point which explains the high utility of milk and eggs in the diet

A NEW BOOK

"Fundamentals in Poultry Breeding"

"Fundamentals in Poultry Breeding" presents the fundamental principles of the science of breeding and gives the gist of the accumulated knowledge and experience of hundreds of successful breeders. The book treats on such subjects as: The Origin of Breeds and How They are Maintained and Improved; Breed Shape and Type; Color and Color Patterns; The Laws of Reproduction and Improvement by Selection; Darwinism and Mendelism in Poultry Breeding; Line Breeding and Inbreeding; Breeding Poultry for the Table, Breeding for Egg Production; Principles of Standard Making, Systematic Mating of Fowls, etc. There are chapters also on breeding turkeys, ducks and geese.

The task of preparing the text for this book was undertaken and splendidly accomplished by the well-known author, John H. Robinson. The book is just off the press and without doubt is the most important publication on this subject that has been issued. The author, in this volume, gives the results of a life-time of study, observation and painstaking research.

The book is splendidly illustrated by Franklane L. Sewell, who has drawn on this unequalled collection of thousands of photos and pen-and-ink drawings for material. There are fifty full-page plates, besides a great number of smaller illustrations. It contains 160 pages, 8½ by 12 inches, a beautiful colorplate, and has an attractive art cover.

We have arranged with the publishers to supply our readers with this book at \$2 postpaid.

AMERICAN POULTRY JOURNAL,
523 Plymouth Court Chicago, Ill.

of invalid or growing youth; and what is good for the weak or young is also good for the well and strong.

Practical Poultry Hints.

Gathering the eggs daily does much to increase the number of eggs that a hen lays. A pheasant hen will lay as many as 25 or 30 eggs if her eggs are gathered daily, although if they accumulate in the nest the hen will commence to set as soon as she has laid a litter of eggs.

Hens that steal their nest usually bring off good hatches, and there are practically no "dead chicks in the shell." Every day when the hen goes to her nest to deposit her egg she not only turns the eggs already laid, but sits down on them and warms them through. It has been found that the periodical warming of eggs being saved for incubation results in better hatches.

Rapid Growth of Geese.

It may interest your readers to know to what extent goslings may grow if they get the chance of good food and good grass, says a contributor to Poultry World, England.

I had one gosling hatched from four eggs on April 23, which was weighed at a fortnight old, and every Saturday since that date. The following are the dates and weights:

Hatched Saturday, April 23—	
Weighted May 7—2 weeks.....	1 lb. 5 oz.
Weighted May 14—3 weeks.....	2 lbs. 12 oz.
Weighted May 21—4 weeks.....	5 lbs. 0 oz.
Weighted May 28—5 weeks.....	7 lbs. 8 oz.
Weighted June 4—6 weeks.....	10 lbs. 2 oz.
Weighted June 11—7 weeks.....	12 lbs. 13 oz.

I will send weights and photo of same bird at 14 weeks old.

The above was put among 200-month-old chicks when 3 days old, and had neither natural or artificial heat.

The Best Breed.

Every person who has given the matter any thought at all is well aware that there is no one breed of chickens that is superior to all others in all respects. Yet how often do we read long articles in which the author attempts to prove that some one or two certain breeds have a monopoly on all the good qualities and all others are culls by comparison.

The most superior or "best" breed of

chickens is a thing that does not exist. The egg laying contests have amply demonstrated that there is no one breed that excels all others even in egg production.

We all have our personal preferences, some liking one kind best and some another. But that does not justify any of us in attempting to depreciate the value of the breeds that someone else likes best.

Much injurious matter has been written concerning the so-called ornamental breeds, but the fact is there is no such thing as a strictly ornamental chicken, aside from some of the bantams, as all of the larger breeds possess many valuable practical qualifications.

It is but natural and proper that each of us should desire to speak a good word for the breed that he has found profitable, but it is possible to do this without detracting from the good qualities of other desirable breeds. So, Mr. Enthusiast, when you again take up your pen to acquaint the public with the good qualities of your chosen variety don't forget that there are many, many other breeds all of which will prove themselves worthy of the very best that can be said for them, if given a fair opportunity.

Mo.

John Miller.

HOGAN SYSTEM

The famous book written by the late Walter Hogan. Contains the results of his lifetime of work and study. Full details on measuring for egg capacity and breeding for egg capacity. The entire Hogan System, fully illustrated. This book is entitled, "The Call of the Hen."

CLASSIFIED ADVERTISEMENTS

UNDER this heading ads will be inserted for fifteen cents per word each month for less than three months, or *thirty-six cents per word for three months*. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under *classified headings*. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from AMERICAN POULTRY JOURNAL than from any other poultry journal—none excepted. On writing any of these advertisers, mention AMERICAN POULTRY JOURNAL. All copy for Classified Ads must reach us by the 17th of month preceding the date of issue. These Rates Void After May 20th, 1922.

STUDENT OF AMERICAN Poultry School desires position on poultry farm, any place. Age 27. Single. Best references. Stephen Zona, 456 Harris St., Plymouth, Pa. 8

POULTRYMAN DESIRES POSITION—Assistant or manager. Several years' experience. Have A. S. P. H. diploma. Age 28. Single. Can furnish satisfactory references. Address B. H., care American Poultry Journal. 8

POSITION WANTED—By poultryman who has had several years' experience as superintendent and manager of one of the largest and most successful poultry plants in the country. Will furnish the very best of references and satisfactory reasons for wishing to make a change. Address Dept. A, American Poultry Journal, 523 Plymouth Ct., Chicago, Ill. 6-8

Show Birds for Fall and Winter

Eight to Ten Weeks Old Pullets

If you want the best birds that your money can buy, you had better purchase them from Oak Dale.

Every one of our show birds bears a remarkable likeness to its parent stock, because for the past twenty years the birds of this wonderful strain have been so mated that it is only reasonable to expect them to carry away the most coveted prizes.

These pullets are the progeny of all our famous winners at Madison Square Garden and Boston during the past twenty years.

The Oak Dale strain of Single Comb White Leghorns has been restricted to only the choicest individuals, thus assuring you that pullets purchased from us are the best value that can be secured.

OAK DALE *Single Comb* WHITE LEGHORNS

When you but stop and think that for the past twenty years we have been carrying away the best prizes at Madison Square Garden and Boston, is it any wonder that Oak Dale birds can go into a showroom and carry away the highest honors?

In our yards today we have these five wonderful males:

First prize White Leghorn Cockerel at the recent Madison Square Garden show; First cockerel at Madison Square Garden, 1920; First cockerel at Boston, 1918, and the cockerel heading the first young pen, New York State Fair, 1919.

A truly remarkable lineup you will admit. But that is not all. These are but a few of the winners we have in our yard.

Those anxious to carry away the best prizes will find it most profitable to write us and state their wants. We suggest that right now is the time to make a selection.

If you have any weak spots in your yard, right now is the time for you to build them up and be prepared for winter.

Get birds that will lay as many eggs in winter as they do in summer and you will then be in a position to realize a great profit instead of a loss as many are now doing by purchasing inferior stock that lay but few eggs in winter.

1921 Mating List Free

Send today for this booklet and therein you will find listed the most marvelous White Leghorn winners of past twenty years. And whose progeny we are offering to you at prices that are within the reach of all.

We can also furnish you with Pens, Trios, Pairs and Single birds.

Secrets of Expert Exhibitors And Easy Lessons in Judging

By FRANK HECK

THE time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition. Most interesting book ever published for breeders.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class. You need this book to protect yourself against dishonesty.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained

You need the book to protect yourself against the dishonest fakir and you need it to put yourself on an equal footing with your honest competitors. It will save you many dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. Have you ever bought a poultry book on general topics or disclosing some system or so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well, this is not that kind of a book! **Don't put off sending your order. You need the book NOW.** The price of the book is, including postage, **\$2.00**

BYERS' ORPINGTONS

At Chicago Coliseum past 34 months—75 of my Orpingtons stood under First Prize Ribbons (all my competitors combined only showed 16 birds under First Prize Ribbons); and in Buffs last winter I showed 11 birds under First Prize Ribbons while all my competitors combined only showed 3 Buffs under First Prize Ribbons. 172 of my Orpingtons stood under Ribbons. I won 13 out of a possible 14 Firsts on Pens and have never lost Special

for Best Display in Buffs, in Whites or in Blacks at this Premier Exhibition—Chicago Coliseum, past 34 months.

Byers' Orpingtons Stand Supreme and have become the Standard Strain of all America. Twenty years of continuous, constructive breeding; my late unparalleled Winnings at the great Chicago Coliseum Shows and my square deal policy in every transaction, unfolds the reason.

Refer to my August ad, on page 756, for Prices on State Fair Winners or address me this evening for literature and complete details. Outstanding Stars in single birds and Pens are here in perfect condition and training to make and maintain your reputation against any competition you choose to meet. Also Hundreds of Champion Bred Breeders and heavy layers that would improve eighty per cent of the flocks of America, for sale. Buy from a real Orpington breeding establishment where birds make good for you after the order is placed.

From my Champions this season I have bred the finest line of 1921 State Fair and early show Winners ever offered. There is no doubt about that. Come and see or engage the most liberal possible values by mail subject to your complete satisfaction.

WYCKOFF'S S. C. WHITE LEGHORNS

AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain — unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that the WYCKOFF LEGHORNS have been, wholly or principally, the foundation of practically every successful Leghorn farm in this country for years. This is particularly true of the flocks making the most wonderful records.

HIGH QUALITY BREEDING COCKERELS

We are now offering the most exceptional lot of early hatched breeding cockerels it has ever been our good fortune to produce. These birds are all from a special selected lot of two-year-old hens of fine type, large size and wonderful layers. They are of a quality unequalled. Greatly increase the value of your present stock by purchasing some of these grand males for your next season's breeding—cockerels of this, the oldest established strain of Leghorns, and recognized by all poultry authorities as the best.

A limited number of fine selected yearling breeding hens and yearling cocks of equal grade left to spare. No more pullets of any age at any price this season.

OUR PRICES, CONSIDERING QUALITY, ARE EXCEEDINGLY LOW

Remember that we sell only **QUALITY** stock such as we would use for our own breeding. No second grade or bought up junk handled at any price.

As we are never fully able to meet the demand, advise that you place your order early. Send for free catalog giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country.

U. R. FISHEL Box A Hope, Indiana

The Schwalge Sectional Incubator

400 to 9600 Egg Capacity—Single or Double Deck

All Prices Greatly Reduced

Our new prices are extremely low, yet the quality is the same as before. We are using nothing but the best California Redwood, heavy galvanized steel, and the solid construction of the machine combined with good workmanship make it last a lifetime.

Reasons why you should buy the Schwalge Incubator:

You may start with one section of 400 or 800 egg capacity and add to it at any time, *even while the machine is in operation*, which is one of the exclusive features of our incubator. This permits the poultryman to start within his means, for he is not compelled to buy a larger machine than he has need of at first.

The Schwalge Incubator is the only one that **does not require continual watching** as other mammoth incubators do. It may safely be left alone for *twenty-four hours* and can be depended upon to regulate itself during that time.

It combines the advantages of the hot-air and hot-water machines, but avoids the undesirable features of either one.

It has a sanitary and efficient **MOISTURE GENERATOR** especially recommended for use in dry climates.

It has the most uniform heat within the egg chamber, front, sides and center. It has 4-inch galvanized heating tubes all around the egg chamber, giving at all times a mild, uniform heat.

It has deep, roomy egg chambers and ventilation distributed over the entire egg chamber rather than in just one spot, which makes the chicks strong and healthy. It has two egg trays and two nursery trays to each chamber of 200 egg capacity (each tray holding 100 eggs) arranged so that they can be adjusted for pedigree hatching, if desired. The chicks may be removed from the nursery without opening the door of the egg chamber.

Each section gives you the advantage of **TWO** or **FOUR** independent incubators (of 200 egg capacity each) **IN ONE**, and heated with one heater.

We give the most far-reaching guarantee that any responsible firm is able to offer on their product.

Send for a copy of our catalogue and new price list and learn of the many other advantages of the Schwalge Incubator.

Owen Farms

S. C. RHODE ISLAND REDS
and BUFF ORPINGTONS
are Ready for You

AM WRITING this advertisement on August 1st. Have already shipped cockerels and pullets that were over Standard weight. You will find among my early hatch cockerels and pullets just the birds or bird to win your early Fall shows. You will find early matured cockerels to head your early matings and give you fertile eggs. The early pullets will be mature for the November breeding. Have culled these early birds very hard and am offering you the cream for showing and breeding.

Thousands of March, April, May and June hatch youngsters are growing rapidly on free range. Will have cockerels and pullets in their prime for showing each week from the first to the last show. It would be wise to book your order early and make sure that you have the winning cockerel, pullet or pen for your show, and that they are not in your competitor's coop.

The choicest lot of cocks and hens ever on Owen Farms are now moulting in fine shape and will be ready for you for showing or breeding. *Remember—Owen Farms birds are line bred from generations of winners and will not only win for you, but breed winning youngsters.*

Utility Qualities

have been considered equally with Standard qualities in the development of Owen Farms Flocks. Stamina, vigor, size, bone and egg capacity are required in every breeder. This careful breeding has told and pullets have gone over the 300 egg mark in trapnests of customers. This year every female was hoganized and tested very high. Owen Farms birds will lay and pay for you. Strong, sturdy birds for Standardbred utility breeding are here at prices you will gladly pay.

Owen Farms' Service

will mean a lot to you if you will use it. Your requirements will be carefully considered and I will select every bird that goes to you as close to your specifications as possible. A complete record is kept here of every shipment and you can secure just the proper birds from time to time to carry on your breeding. Come here to Owen Farms, if you can. Will talk to you on paper exactly as I would were you sitting beside me at my desk. Tell me your problems and let me help you solve them. If you will tell me frankly just what you need and what you can afford to pay, my reply will frankly tell you exactly what to expect. My long experience is at your disposal and will be freely used for your benefit. Write today and find just what it will mean to you to have help from Owen Farms.

An Investment in White Plymouth Rocks

Thirty-five Baby Chicks, Selected from Wellbred Stock Were Properly Reared and Developed Into a Dividend Paying Flock—Trapnests Then Recorded the History of the Pullets.

By Willard C. Thompson

INTEREST always seems to be aroused when a true hen story is told, especially if the readers are real poultry lovers. Therefore, the writer this month begs to offer the story of his own flock of hens, believing that what he learned from that flock may be of help to some of American Poultry Journal's enthusiastic chicken raisers.

Purely through an accident the writer learned early in March of a spring not so long past that it was possible for him to obtain thirty-five fine, healthy White Rock baby chicks, hatched from eggs produced by a pen which had earlier sent to an egg-laying contest a bird capable of producing 301 eggs in her pullet year. That seemed like an extraordinary chance, and it was a big opportunity.

The little bluish white youngsters, sturdy and strong, were about four days old when they were bought and placed under a warm, reliable brooder. They had used up the greater part of the yolk supply which Nature had given them as food for their first three days, and consequently were hungry and went at the sour skimmilk and scratch grain instinctively as soon as they were released from the parcel post containers in which they had comfortably ridden some three hundred miles across country. Luckily they were not in the least chilled. They had been packed carefully and shipped promptly, and were handled with some attention enroute to destination.

The first night's supper was largely liquid, as it was desired to get them immediately into the habit of liking to drink sour skimmilk. They began the habit with a vengeance, leaving only a little bit of room in their crops for the scratch grain, which consisted of about equal parts of rolled oats, fine cracked wheat and fine cracked corn. After a day or so pinhead oats were substituted for the rolled oats, and the grain was fed four or five times a day. The little Rocks were kept a bit hungry, and always ready for sour skimmilk, fed in a regular water fountain.

After a week in their new home their feed ration was increased by placing wheat bran with about five per cent of fine, dry, granulated bonemeal in front of them. In the second week the grain meals were cut to three in number, and a fountain of clean, fresh water was placed alongside the fountain of sour skimmilk. Once a day they received a bit of hard boiled egg, and chopped green

food, in this case sprouted oats. At two weeks a dry mash consisting of approximately three parts, by weight, of wheat bran, one part each of wheat middlings, ground oats, cornmeal, and one-half part of meat scrap was substituted for the bran and bone mixture. And from then on they grew!

There was no secret process used. They were not two weeks old when they were allowed to go out of doors; and throughout the following rearing season, free range, plenty of green food, sour skimmilk, mash and grain, and sanitary environment kept up the good work of promoting development. When October came thirty-three of the White Rocks had developed into handsome youngsters, and twenty-one of them were pullets. One pullet had green

shanks and so she went the way of all good, plump culls—to market. Approaching Autumn found these pullets weighing a trifle over five pounds and rapidly coming into maturity. So it was decided to put them into a laying house about November 1st, and begin trap-nesting the individuals. What they did from then on in the line of egg production is what the writer really wants to impress upon his readers.

A well-built poultry laying house, with lots of fresh air, light and room which Professor Thompson used to house his flock of White Plymouth Rocks. Unlimited range and green food fitted them for an egg producing career.

Trap-Nesting is Worth While.

If there had ever been any doubt in the owner's mind as to the economy of trap-nesting, or in its real value, the results of the following year cleared it up.

A trap-nest record is immensely interesting! A study of such records opens up a key to poultry breeding and management which cannot be learned in any other way. Of course, for the first few weeks it was necessary to devote quite a lot of extra time to the trapping of these pullets, for two or three of them persistently wanted to lay on the floor back in the corner of the house. Only patience and constantly placing the culprits in the trap-nests overcome the bad habit. Two of these very birds turned out to be star performers.

There are several little points that one must remember when installing trap-nests and beginning systematic breeding work:

Have the trap-nests sufficiently large to accommodate the breed of birds being trapped. Mine were White Rocks, and it was necessary to have the laying section of the trap-nest fourteen inches wide and twelve inches deep. A piece of three-inch white pine separated this section from the front section (Continued on page 836)

American Poultry Association at Seattle

An Interesting Meeting, Well Attended by Pacific Coast Poultrymen—
Ed L. Hayes Engaged to Serve as Field Secretary—Next Convention to
Be Held in Knoxville, Tennessee—Production Classes Not Approved.

MEMBERS in attendance at the forty-sixth annual convention of the American Poultry Association were given a royal welcome by Pacific Coast interests at Seattle, August 9 to 12, 1921. About 325 members registered, including a hundred or more new members who were voted in during the meetings. At one time 65 new names were submitted and accepted. This increase largely represents commercial egg farmers on the coast, where White Leghorn egg farming is a highly specialized and profitable industry. Eastern poultrymen who made the trip were much impressed with the appearance of these commercial farms and the success with which the birds were handled. They spoke in words of generous praise of the general environment under which the flocks were kept, the housing and the methods of management.

The convention approved engaging an organizer or field secretary. Ed. L. Hayes of Minneapolis, Minn., was employed at a salary of \$2,500; and an appropriation of \$4,000 was made to cover the expense of his travel. Mr. Hayes is a natural organizer, an experienced breeder and judge of Standardbred poultry, and local poultry associations that have been members of the A. P. A. for years, but in which time they have never been favored with a visit from any of its officers will, no doubt, be glad to know that a traveling representative is now in the field.

A New Standard Breed.

The convention admitted Chanticleers to the Standard of Perfection. This breed was originated by the Trappist Fathers of Quebec. Some of the specimens have been shown at the last two Chicago shows. They have something of the size and type of a White Wyandotte, but are rougher in feather and have a small rose comb devoid of spike, similar to what you would get by crossing a pure rose comb on a pea comb. County fair associations that pay prize money on all Standard breeds will now have to list Chanticleers, and pay the same money on them that they do on White Wyandottes and other established breeds, although we know of no breeder of Chanticleers in the United States. This new variety, along with Missouri Fluffs will be added to the American class, and

take their places with Plymouth Rocks, Wyandottes, Rhode Island Reds and Javas.

Black Giants, Rose Comb Barred Rocks and Rhode Island Whites were not admitted to the Standard.

The report of the Committee of Forty was read, largely adopted and referred to different committees, particularly the Standard Revision Committee. When this report came up, President Thos. F. Rigg ruled that those sections which referred to Standard revision would have to be passed on to the Standard Revision Committee without recommendations

by the Seattle meeting. Appeal was made from this decision, and after lengthy discussion, Harry Collier of Tacoma, Wash., stated that after consideration he would not appeal from a decision of the chair and did not want the Seattle convention to overrule the President of the Association. The appeal was, therefore, withdrawn. Thos. F. Rigg then stated that if that was the way the members felt about it, he would withdraw his ruling.

Judge Branch of the Standard Committee, Director De Lancey of the Eastern district, Director Adams of the Southern district, and Director Burton of the Southwest, were a unit in opposing production classes and the insertion of a chapter on the physiology of

egg production in the Standard, and the convention adopted a resolution to the effect that the chapter on production be not placed in the Standard. Production classes were not approved. The matter was discussed at length, but it was agreed that if a Production Standard should ever be issued, it would be as a separate Standard.

In appointing the new Standard Revision Committee, Harry R. Lewis, recently of the New Jersey Agricultural College was named as member of the Standard Revision Committee. The other members of this committee are: Theo. Hewes, E. C. Branch, A. C. Smith, Walter Burton, W. M. Coats, Geo. Robertson and the president. The only eastern judge and breeder, H. P. Schwab, was dropped, we regret to add. A general description of a capon is to be placed in the 1923 Standard. A Standard for eggs is to be included. Illustration of a dressed fowl is to be (Continued on page 864.)

Ed. L. Hayes, newly appointed field secretary of American Poultry Association. Photo shows Mr. Hayes instructing a group of boys and girls in poultry judging, when in the employ of U. S. Department of Agriculture. Mr. Hayes is a fancier, believes in a breeders' organization, and breeders, judges and local poultry associations will see a new era of activity with Ed. Hayes traveling over the country for the A. P. A.

Establishing A One Man Poultry Plant

Capital Necessary—Number of Hens to Keep—Amount of Land Required—Problems To Be Met—Essentials for Success With Chickens on an Economical Scale.

By H. G. Forster

I VENTURE to assert that quite a fair percentage of the readers of this publication would drop other work and go into the poultry business in earnest if they knew they could, or even thought they could gain a substantial livelihood from the keeping of chickens. I base this assertion upon the fact that the editor will tell you that he is constantly receiving letters asking for definite figures, for definite information and for definite assurance that keeping chickens on a commercial scale is a paying proposition. In order to give readers of American Poultry Journal the desired information on this interesting, and certainly most important matter, it has been deemed advisable to combine into one article a number of the more important questions that have been asked and then cover the subject in as concentrated and satisfactory a manner as its limits will permit.

All poultry breeders realize that in order to make the poultry business grow, and grow substantially and well, it is necessary to receive into the ranks each year those people, with some or little experience, or no experience at all, who have the keen desire to go into the poultry business. But they also know, and realize from their own experience, that such folks must be fortified with all of the reliable information possible beforehand in order to make their ventures a success. No business benefits by having a vast number of new recruits added each year, only to have a large percentage drop out after a year or so. This gives any business a "black eye," and we all know that the poultry business has received its full share of these. The stability of the poultry business depends, not alone upon the enthusiasm of its devotees, but upon their practical knowledge and how they may best apply it. No breeder who is worth his salt desires to see anyone enter the poultry business only to fail. All the real chicken men I have ever met are not alone willing, but anxious, to be of real help, especially to the beginner. The poultry breeders welcome new members—they know it means the upbuilding of the business. As the older breeders pass we must have new ones to take their places.

There are several classes of people who desire to go into the chicken business upon a "living" scale, and who possess many of the requirements. In other words, to keep enough fowls to enable them to drop other work and not lose thereby. Let us class them under various headings. Perhaps you will find yourself under one of them:

1. The man, who, born and raised in the country, was attracted to city life in his youth. Upon reaching maturer years and judgment, he finds that it would have been better had he stayed on the land. He has forged ahead to some extent, but due to a number of circumstances, plus the "call of the land," he has not reached a satisfactory and satisfying position in life. Furthermore, he realizes that his declining years may be precarious ones, if he doesn't do something to remedy matters.

2. The man who has lived in town, but has a hankering towards out of door life, and is especially attracted to poultry. He may live either in the city, or in the suburbs. He may have kept some chickens, which has given him a taste for larger fields. He would go in the poultry business if he dared make the venture. This sort of man usually has a little capital available.

3. The man who lives in a town or village and has kept quite a flock of chickens. He has been successful, and sees no reason why he cannot become a prosperous commercial poultryman in a short time. He has been able to sell his products at a high price; in fact, has done well. His profits on his fowls show a most encouraging total at the end of the year. This man is, in effect, already half a poultryman, and it is but a jump to a regular poultry farm for him—but a pretty big jump at that, as we shall see.

It can be assumed that practically all those wishing to

engage in the poultry business are men or women of moderate means. No matter in what walk of life you may be at present, unless you are wealthy, you will all be faced with practically the same problems when entering the poultry business.

How Many Hens Must I Keep?

This depends somewhat upon how large an income will satisfy your needs, and how hard and systematically you are able to work. Generally speaking between 1,000 and 1,500 hens properly kept will give a man and his family a good income. Sufficient to feed, clothe and educate them decently, own a very modest little car, and save something extra in the bank at the end of the year. Some poultrymen make as much money with 1,000 birds as others with 2,000. This depends upon your own ability to a great extent. It is seldom possible to make a substantial living with less than 1,000 birds, however.

Do not forget that with a garden and other things furnished for almost nothing, and with living conditions simpler, a smaller income in the country goes much farther than a larger one in the city. It is what we have to show for our labor that counts in the end, rather than how much we have earned and spent.

How Much Land for 1,000 Hens?

Undoubtedly you need more land than most people recommend. The tendency today is to give fowls greater range, both for young and old birds. The mistake in the past, and a mistake many are making today, is to have too many birds on a small place. It is far better to buy a place a little farther from town where you have more room, than to live on the outskirts because it is handier for you. If you are really in earnest about going into the poultry business, you must be willing to sacrifice a little for the good of your fowls.

I know of one very experienced poultryman who is planning to house his layers in the following manner:

Erect a number of 20x20 foot permanent colony houses, holding 100 layers or breeders each. These he plans to give an acre of ground, divided into two half acres for range rotation. Sounds pretty well spread out, doesn't it? And yet I firmly believe he is doing a very sensible thing. It means a few extra steps, but if the health and production of the flock are maintained to a greater degree, almost anything is worth the trouble.

In any case, allow enough room for each unit of layers to give them a good yard rotation.

And no matter what else you may think about room for layers, you positively must give growing stock plenty of range. An apple orchard, a large field set to peach trees, a running brook, plenty of expanding room are what you must provide. An acre of range is not a bit too much for 200 growing youngsters. If you grow 2,000 to maturity, 10 acres just for growing purposes is usually enough, though that can be too little if your ground is poor and bare. Room, greens, shade, cleanliness plus good feed and fresh water will do wonders. Without any one of these essentials it will be best to stick to your present job, even if it is peddling peanuts.

Should I Buy a Poultry or Regular Farm?

In most cases I should say buy a regular farm. There are good reasons for this.

First: The regular farm has more acreage than most poultry farms, and the land has not been used so intensively for live stock.

Second: There are many excellent buildings convertible into poultry purposes on many farms.

Third: You can usually buy a farm for less money than a poultry plant with anywhere near the eventual capacity.

Fourth: Buildings on many poultry farms are poorly

planned, too close to each other, etc., and before you get them as they should be, you might as well have built new as you wanted.

Fifth: Of course, if you are able to buy a poultry farm at a reasonable price, so much the better. But be sure that what is making him sell to you won't make you sell to the next fellow. The ground may be poorly drained or contaminated, the buildings poorly ventilated and damp in bad weather—there are a good many possibilities along these lines that need careful investigation.

Sixth: You can make a farm into almost anything some day, but a small poultry plant has its decided limitations.

When Shall I Start?

You may start at practically any time of the year, but generally the spring or fall are the logical times. If you have had sufficient experience it will probably pay you to start in the spring with baby chicks and raise them to maturity. If you have not, you may commence with half grown pullets, well past the danger period, or with mature pullets ready to lay.

If you start in the spring you will require about 3,500 to 4,000 chicks to be sure of 1,000 well developed pullets. They will cost you about \$1,000 to buy, and will cost another thousand to raise to maturity, costing you around \$2 per pullet for 1,000.

Half grown pullets will cost you between \$1.50 and \$2 each, and you should buy about 1,100 to allow for mortality and culling. Adding cost of feeding them to laying age it will cost you about \$2.50 per bird, or a little more than the first method.

If you purchase 1,000 full grown pullets you will pay around \$3,000 for the lot. In this case you will avoid cost of brooders, heat, feed, mortality, colony houses, etc. and are really better off in some ways. But if you can raise chicks successfully you will do better that way, because it will cost less per bird, and you will have your equipment for the next season bought and paid for. Much depends upon you in your choice. All three ways are good.

What Kind of Chickens?

Consult your possible future business demands and your desires. Pick out a breed, and variety of that breed, well established in popular favor, one that has been bred for heavy production, and one that will sell readily as a breeding fowl—and one that pleases your eye.

Among the lighter breeds we find the Single Comb White Leghorns the established commercial egg farm favorite.

Among the American and English breeds we find the Plymouth Rocks, Rhode Island Reds, Wyandottes, and Orpingtons. These are all well liked and well known.

Among the heaviest breeds we note the Brahmas, and now the Jersey Black Giants are making a strong bid for popular favor.

Pick out one or two of any of these, preferably one lighter breed and one heavier; you can thus meet all demands of customers.

Generally, a variety possessing a solid color is better to breed and advertise, as the more complicated feathered breeds are hard to breed true to markings and are not so popular commercially.

How Much Will It Cost to Equip a 1,000-Hen Farm?

If you can convert some well-built barns into laying quarters, the cost per fowl need not be more than between 50c to \$1. But if you build new, figure on about \$2.50 per fowl. For laying quarters large enough to accommodate 1,000 layers, it will cost in the neighborhood of \$2,500. If you can do much of the work yourself, are able to buy up some lumber bargains, and can get a carpenter to work for a reasonable wage, it will not cost you quite so much. But a substantial poultry building requires a certain amount of lumber and other material, and they cost money. Less in a warmer climate, to be sure, than in a cold one.

The modern colony house is a very efficient building for all sorts of poultry purposes. We should not recommend the erection of a long heated brooder house these days. The

colony house will meet most of its requirements and many others. The latter costs less per fowl, and is much more practical in so many ways. These colony houses cost about \$75 for a 10x10 house, and somewhat less per square foot for larger. A good plan is to buy one of the best makes of portable houses and build all of the others from it at less expense.

Study the various successful types of poultry quarters and adopt those best suited to your climate and location.

Besides laying and colony quarters, you will need feed storage capacity, place for your incubators, colony brooders, fencing, and endless other things.

How Much Capital Do I Need?

If you expect to start on a good-sized scale as here shown, it will take money—and money you must have. If you are able to purchase a nice little farm for \$5,000, and can pay \$2,000 cash, you may carry the mortgage at \$15 per month. This does not include taxes and insurance. Another \$1,000 will give you feed storage capacity, a shed for odds and ends of things, and will help convert some old buildings into serviceable poultry quarters. Another \$1,000 will equip you with brooders for a season or so. Another \$1,000 will purchase enough of the best chicks to give you 1,000 pullets in the fall. If you buy hatching eggs instead, you will need incubators, but usually the first season few poultrymen buy eggs—they get the chicks. You will need colony houses for the chicks—15 at about \$75 each which runs into another \$1,000. Then if you need some additional laying quarters in the fall, another \$1,000 will go the way the rest did. Our total so far is very roughly \$7,000. We should most earnestly recommend that there be a surplus in the bank of \$3,000 to pay for feed and living expenses. Of course the broilers will bring a substantial sum, which will help. There will be other expenses too numerous to mention. This is a total of \$10,000 for the first outlay—a pretty substantial sum, to be sure. But if you are successful, you will find that that money will bring in a high percentage of profit in time. (While it is true that many successful poultrymen started on a "shoe string," the first year or two required some limitations and some privations. Equipment is today so standardized that if a man has the money to invest he can go ahead safely.—Ed.)

Where Shall I Locate?

Where you feel your family, and as well as your birds, will do best. Don't go out too far if you have children to educate. Don't be too near if you wish to grow. Strike a happy medium, and try to get the most for your money. With a car, distance becomes of almost secondary importance today. Locate within good shipping distance of some of our largest markets, whether in the West, Middle West or East. If you are not sure about the state, select one that is progressive and is doing real things for its poultrymen—then you will be helped and inspired in your business venture.

Can I Care for 1,000 Hens Properly?

Most of the year you can. Perhaps in the spring you may require the services of a bright, ambitious, reliable boy for two or three months. If you are willing to put everything you have into your business, love the work, and plan things systematically, and are conscientious into the bargain, you can handle 1,000 mature fowls properly, even 1,500 under exceptionally favorable conditions.

What Sources of Income Will I Have?

A good many, fortunately.

First: Your table egg production is one of the largest and most important items. Careful grading, shipping and selling methods will insure a better than market price. If your state has a co-operative selling organization join it, and boost for all you are worth.

Second: By selling baby chicks and hatching eggs. These are two of the largest sources of income, and should be developed as extensively and rapidly as possible. It means that in the spring when table egg prices are low, the production can be sold through other more profitable channels.

Judging Purebred Poultry in the Shows

General Judges of Wide Experience Are Least Apt to Ride a Hobby—True Breed Type Is Fundamental—Danger of Overestimating Trivial Faults—Shows Will Not Provide "Production Classes."

By J. H. Drevensedt

THE foundation of the Standardbred poultry industry is the poultry show. It is the keystone of the structure which embraces within its confines not only the American Poultry Association, but every other organization consecrated to purebred fowls, as well as every poultry publication on the face of the globe.

Without poultry shows Standard breeds would cease to exist and poultry journals would die in the shell before they were hatched. The barnyard fowl would reign supreme and receive but scant attention by farm and trade journals. Competition is the life of trade. This most emphatically applies to the Standardbred poultry industry. Without competitive tests in the show-room the whole pure-breeding Standard-fowl structure would crumble and become a scrap heap.

No matter how useful nondescript horses, cattle, sheep, swine or poultry may prove to be, they never attained superiority, attracted attention or commanded high prices until man made them over into pure or thoroughbred races, or, in other words, standardized them into breeds and varieties.

The Standard in Breeding and Judging.

It is the Standard of every breed of live stock in the world that governs its destiny and that of its breeders. It is or should be, the guide for the breeder and the law for the exhibitor and judge.

Standards are not perfect. No man-made Standard for live stock ever will be, until the millennium arrives and all men think and interpret alike. The laws laid down by the accepted and recognized Standards must be obeyed, even if some of them may appear unjust to breed or variety. We can only breed to and judge by one Standard, if the type and color as described in the latter is to prevail and the interests of all exhibitors are considered.

The two opposing forces in the show room, the exhibitors and judges are also the controlling elements at all our exhibitions of Standardbred poultry. Without the hearty support from exhibitors and confidence in the efficiency and integrity of the judges, no poultry show management can ever hope to establish a reputation that will make its annual exhibition permanent and popular. The spirit of the fancier with which nearly every exhibitor is imbued, must also find a responsive chord in the management as well as in the judges.

When exhibitors send their birds to a show, they naturally expect to win with them. The judge looks them over and either hands them the ribbons or gives them the gate. It is the judgment of one man against the opinions of the many. That this unequal division of forces should bring about criticism—deserved or unjust—of the judges' work, is natural, especially when ownership of the birds is apt to influence our judgment too strongly, if not al-

together unreasonably. The adjudicator, with no proprietary interest in the exhibits, is or should be, in a position to render impartial judgment at all times.

The Judge Must Be Honest.

The judge who fearlessly and conscientiously does his work, following the Standard as his guide, will give general satisfaction and demand respect, even if he does slip up every now and then on a very close decision. He gains prestige and becomes permanently popular with exhibitors and show managers, in

contrast to the judge who strays from the beaten path and follows the more or less thorny road of the faddist-exhibitor who breeds to a personally constructed Standard of his own. In my experience as a judge of poultry and cattle since 1883, and from my observations in attending poultry, live stock and kennel shows, I have come to the conclusion that no fairer class of exhibitors and more competent judges exist than those found in the American poultry fancy. In no other branch of live stock functions can be found the same fancier's spirit and absence of dominating influence of big exhibitors, that exists in poultry exhibitions of the United States and Canada. But judging poultry is quite different from that in vogue at dog, horse and cattle shows. No exhibitors are around to handle their birds in the presence of the judge, when he is engaged in making his awards. Judges have a card or book of entries to work by. These contain the numbers of exhibits in each class only; consequently the judges in most instances do their work alone and unhindered, ignorant of, if not indifferent to, who owns the specimens they handle. This method of placing the awards has been found the most satisfactory, as a rule, as far as the judges as a class are considered. It is true, that at some very good shows the names of exhibitors as well as the names of the breeds or

The Standard of Perfection

From the inaugural address of President Thomas F. Rigg, at the Forty-sixth annual convention of the American Poultry Association, Seattle, Aug. 12, 1921.

THE STANDARD OF PERFECTION—The Standard of Perfection is the most valuable asset of the Association. It is the one thing which today holds the members together. It is the heart of the Association. It represents the highest ideals of the active members working throughout all the years of the Association's existence. It is the link which binds the present with the past, and through which the enduring spirit of the fanciers who organized the Association has come down to us as a benediction,—a prayer that we preserve in its integrity all that is good and beautiful in Standardbred fowls. Let us keep faith with the fanciers to whom we are indebted for much we cherish today. Let us carefully guard the Standard of Perfection, allowing no alien hands to touch it, to mar and deface the ideals we have so carefully and tenderly placed therein.

I am opposed to the Standard of Perfection containing any matter other than that having to do with illustrating and describing the ideals in Standardbred fowls.

varieties have been displayed on cards placed on the coops before and during the judging, and the plan has been found to work out satisfactory in many instances; but while some judges will pay little or no heed to the names on the coops, others again may find them a mental handicap. The judge's mind should be centered on the birds at all times with no thought of or worry over who owns or wins the prizes, until after he has completed his work. It is also true that the closed system of judging, with its absence of exhibitors in the aisles and only numbers on the pens or cages, is not entirely a guarantee that a judge who stands in fear of turning down some big exhibitor, may not look up the numbers in a catalog before he places his awards. Such judges, however, sooner or later, release themselves of officiating at leading shows. A weak-kneed adjudicator merits no consideration in the poultry show room; and soon loses the (Continued on page 846)

Conditioning Birds for the Poultry Show

Birds With Broken or Dirty Plumage are Handicapped—Wash White Birds—Dry White Leghorns by Fanning Them—Ship Birds in Clean Coops and Wipe Out Exhibition Cages Upon Arriving at Show.

By M. L. Chapman

AFTER breeding, growing and finally selecting your birds, the greatest factor in producing a winning string of birds will prove to be condition. There was a time when a bird of extra quality would win in almost any show, but with the large number of high-class birds that are annually grown and exhibited now-a-days, it is practically impossible to win a first or second prize at a show of any importance unless the birds are in perfect condition. The ignorance of amateurs and beginners as to what constitutes perfect condition is responsible for much of the "kicking" and dissatisfaction with the judging and management of poultry shows.

For instance. A beginner buys a cockerel for \$45 to exhibit at his local show. The cockerel arrives just before the show, washed and properly conditioned. All the important feathers are in shape and any minor feathers that might have been off color, are minus. The cockerel wins first and the buyer is much pleased with his investment. When the next show season rolls around, he again makes an entry. It is a bigger entry this time and he mentally figures up how much the first and second money in all the classes will net him, for of course he will win.

When the judge handles his fine bird that won first the year before, he finds one sickle feather gone, two or three wing feathers broken and a number of off-colored body feathers that should have been pulled. It does not take the judge ten seconds to see that there are plenty of birds in the class that will beat this one, so he puts him back in the coop and wastes no further time on him. For similar reasons, this exhibitor's young stock does not fare much better. Our amateur friend is furious; he has been robbed. The judge hardly glanced at his bird! Did not his bird win first last year, and did he not pay more money for his stock than the fellow who won? His stock must have been in good condition, as he had the most expensive hen house in the vicinity, and paid the highest price for his grain, etc. Or, perhaps, it is the breeder who sold him the stock who comes in for condemnation. Men who are reasonable about everything else, often act this way and blow off a lot of tommyrot they are sorry for afterward.

What Constitutes Perfect Fitness.

A great many would-be exhibitors get no further than this second exhibit, and after spending considerable time and money, quit the fancy in disgust just when a little persistence would enable them to realize handsomely on their investment. We believe that this lamentable state of affairs could be largely overcome if every amateur would make a thorough study of what constitutes perfect fitness of the American show bird.

A bird to win must carry all of the wing and main tail feathers unbroken. The cuts that the judges are instructed by the Standard to make for these omissions, are so great that in close competition a bird so handicapped has little chance at the blue or red. Everyone should inform himself as to the exact weight that birds of his particular variety are to weigh in the show room, to pass uncut, as in a score card show proper size is a great factor. A bird that was absolutely clean legged last season, may sprout a little down on shank or toes. Better use a microscope than to let the judge find it. Don't let the old hens get over-fat, as it makes them look older than they really are and unattractive.

Perfect cleanliness is essential, especially in regard to white birds. This is one of the arts of the profession. There are only a few men who have ever been able to put white birds in the show room in the best possible condition. The general information that has been given out by the poultry press in regard to this matter is all right, only it doesn't go far enough.

My first correct impressions as to the proper way to wash anything came to me while in the army, where every man washed his own clothing. It did not take me long to find out that my handkerchiefs, etc., did not look "just like mother used to make them." Upon investigation I found that to wash anything snow white was quite a lot of labor. It required much soaping, boiling, rubbing, blueing, etc. One simple wash in warm water didn't do it, not by a good deal.

Washing of White Fowls.

To wash a large string of birds for a show is quite a task. The way we prepare our white birds is as follows: About ten days before the show, if we are to exhibit say thirty birds, we select about forty and give them a good, thorough wash, using ivory soap and water about as warm as we can comfortably work in. Use a brush on head and legs and on any stained spots in the plumage. Rinse very thoroughly in a separate tub of water that is a little cooler, and then dip in a third tub of water that is slightly blueed and that is just tepid.

Do not have water too blue, as a bird that gets streaked up with blue is ruined for the time being. Many fanciers do not use blueing at all on this account. Its use is optional. Do not wipe the bird with a cloth or try to squeeze out the water with your hands. Simply drain for a moment of two over the tub, then put in a cage with a burlap bag in the bottom to catch the water. Have the room at a temperature of ninety to ninety-five degrees and, if possible, keep the unwashed birds in a cooler room.

The birds should be practically dry in four hours. We put the wet birds near the stove and gradually work them back as they dry. Reduce the heat in the room gradually as the birds dry off. You can wash about five birds in a tub of water, then dump out all three tubs and replace. Of course soft water is much better for this purpose than hard water. It will take two or three men about all day to wash a string of this size, and it is not an easy job either.

After your forty birds are all dried out, you can go over the string and pick out the birds that did not improve with the wash, so to speak. Some will prove to be considerably whiter than others; some will probably have stained spots on the plumage that no amount of washing could remove. We select about thirty-five and take special care of them for another week and then give them another thorough wash. This second wash improves them fully as much as did the first one. After they are dry we make our final selection of the thirty that we shall show.

Leghorns and birds that have long tail feathers require special handling while they are drying. If you leave a Leghorn male alone he will probably curl up in a corner, jam his tail off at right angles and when the feathers dry they will be standing out sideways from the bird instead of to the rear, as nature intended. In order to overcome this, it is well to take the bird when he is about dry and fan his tail until he is practically dry. In fact it is a good idea to fan the tails of the Leghorn females. They web out nicer and you can shorten the drying period by almost one hour. We use a large stiff cardboard with a couple of wooden handles nailed to it to fan with, although if you have electricity, you can use an electric fan to good advantage. Also induce the birds to flap their wings once in a while while drying. This improves their circulation and assists in drying the plumage and appears to make them feel more comfortable.

Attention Required Between Washing and Showing.

The greatest care now is to place them in the judge's hands without them being soiled in any way. Feed hard grain from now on. Have a man continually (Continued on page 854)

The Beautiful Silver Penciled Wyandotte

Enthusiastic Breeders Actively Engaged in Breeding this Strikingly Beautiful Variety—Strong Contrast of Black and White in the Male and Exquisite Pencil-
ing in the Female—Origin and Mating.

By F. L. Platt

THERE is a revival of interest in the distinctively beautiful Silver Penciled Wyandotte variety. For many years wonderful specimens of this variety have been shown, particularly at the Boston show. But the men who bred these handsome specimens were largely gentlemen-fanciers who bred for pleasure and perfection, and their stock was not generally distributed into the hands of new breeders, for the public was not stimulated by the common business methods of selling and advertising to take up the breeding of the variety.

A new era dawns, however, and new names are appearing in the list of exhibitors of Silver Penciled Wyandottes at the Boston show, and these breeders have organized a club for the purpose of promoting breed popularity. Fred F. Field, Jr., Secretary of the International Silver Penciled Wyandotte Club, writes:

"There has been an increasing amount of these birds raised this year, and if they are given the publicity that they deserve, I see no reason why they should not become one of the most popular breeds, as they have the laying qualities of some of the better breeds, and surely are as beautiful a fowl as there is raised today."

At the last Boston show, there were 54 Silver Penciled Wyandottes in competition. Herewith is reproduced one of the winning hens, which was shown by Fred

W. Rogers of Massachusetts. The cockerel illustrated won 2nd and was shown by Mr. Field's Oak Hill Poultry Farms, Mass. Mr. Field kindly furnished us several photographs from which we made these selections. He afterwards expressed regret that we should have selected the picture of his bird in preference to the photo of the 1st prize cock which was shown by one of his competitors. His reason was that his cockerel, whose likeness appears on this page, was not completely finished in neck and tail plumage. He criticised his own bird and favored the bird of another breeder. We mention this matter for two reasons: to illustrate the fine fancier's spirit which prevails among the breeders of this variety; also to emphasize the fact that cockerels may show wonderful quality to the trained eye before those cockerels are fully matured and completely finished, and new breeders should educate themselves to measure the potential possibilities of a young bird. Especially at this season of the year, raw cockerels of the right breeding should not be judged too harshly, but should be gauged with due allowance for that further development which time will bring about.

The Silver Penciled cockerel illustrated has a typical Wyandotte head. The skull is round, the wattles rounded, the beak round, and the head is capped with a rocker comb.

The Silver Penciled Wyandotte male carries a plumage of well defined and sharp contrasts. The breast, wing bar, body and tail are black, with a greenish sheen to the black. The wing bow is white on the surface. The neck and back are white, and through the center of each hackle and saddle

feather there runs a black stripe which tapers to a point near the lower extremity of the feather. No white shafting in the stripe or black edging on the feather is wanted.

The female is very differently colored from the male. She is beautifully penciled. There is a tendency to a reddish-white ground color, but it is less attractive than a steel-gray ground color, and the latter offers the proper base for the crescentic bands of black penciling which are the beauty of the female.

We do not know why the female should be so differently marked from the male; it is as if nature had performed a miracle for the delight and fascination of the lovers of animated bird life as seen in our races of domesticated poultry.

Origin of the Variety.

The inherited qualities of the Silver Penciled Wyandotte

which come from the good old Dark Brahma, Silver Penciled Hamburg and Silver Laced Wyandotte are of the best. Its originator told of five pullets laying 400 eggs in 100 days; of pullets hatched July 12 that were up to the Standard weight of five and one-half pounds by January 12, and laying; and of the cockerels that were well fleshed at all ages. Unfortunately for the general popularity of the variety, it became a gentleman's fowl, in the hands of exclusive breeders. Publicity

A pair of representative Silver Penciled Wyandottes, winners at the last Boston Poultry Exhibition.

cannot increase the popularity of a breed unless there are merchandising methods back of it.

On the other hand, many beautiful and worthy varieties have not been advanced because the poultry press has emphasized merchandising too much. How are good but neglected varieties ever to get out of the slough in which they are mired if, when the breeders do their share in bringing out an outstanding class such as was seen in Silver Penciled Wyandottes at Boston last January, the show reporters do not recognize and give proper publicity to the class? Happily the policy of American Poultry Journal is to give as much thorough examination and extended comment to Silver Penciled Wyandottes at Boston as to the White Wyandottes. We believe that such reports serve to keep up interest in the different varieties, which must be done if all worthy breeds and varieties are to live and prosper.

We mention this matter to call attention to the fact that a new breeder can take up an excellent and beautiful variety like the S. P. Wyandotte, and if he shows birds of merit in the leading shows of the country, his birds will receive from us the same consideration and recognition—and the same prestige will accrue to his breeding—as though he were showing a more widely advertised variety.

There is every reason why S. P. Wyandottes should now go forward. As we look into the past we see a variety whose roots adhere deep and vital into three of the grand old breeds, a variety whose inheritance none can question, a variety that was built by master breeders, and (Continued on page 853.)

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

Meat Values in Dual Purpose Breeds

Let us take a trip through the corn belt where the feed is grown. As the train pulls out of Chicago, we glance over the market page of the morning paper. It is August 8, 1921. The wholesale quotations for the preceding day are: old hens, 26½c; old female sheep, commonly known as ewes, \$3.25 per 100 lbs.; hogs, \$10.50 per 100 lbs.; corn 56c a bushel.

That means that 100 lbs. of hens are worth \$26.50. One hundred pounds of hens at this price are worth as much as 250 lbs. of hogs; 100 lbs. of hens are worth as much as 800 lbs. of sheep; 100 lbs. of hens are worth as much as a wagon load of corn that measures approximately 50 bushels.

The train speeds on across the fertile country. Corn is growing in the rich, brown silt loam, as high as the car window. Three billion bushels of it! What is the nation to do with this crop of corn? The people cannot eat it.

All the people of the United States eat only one-sixth that much wheat, and wheat is "the staff of life."

Corn is not a food for man. It is a food for animals. It is marketed—the great bulk of it—as beef, and pork, and mutton, and chickens. The men who are growing corn, the one big crop of the middle United States, need lean animals to turn corn into meat. Based on this need, they keep not milking Holstein cattle, but beef-type Angus, Hereford and dual-purpose Shorthorn cattle. They keep not bacon-type Tamworth hogs, but the big pork-type Poland-Chinas and Duroc-Jerseys. They keep not Leghorn chickens, but dual-purpose fowls.

The popularity that Barred and White Plymouth Rocks and other dual-purpose breeds enjoy with these corn-belt farmers is not an unstable popularity, due to advertising or breed exploitation; it is a popularity based on sound economics, on an adaptability of these breeds to fit into the best systems of corn-belt farming.

Our train pulls into Champaign, Ill., and we alight. Here is the University of Illinois, the State College of Agriculture, the State Agricultural Experiment Station. We walk across the college campus and out to the live stock judging pavilion.

Within are farm advisers and farmers from all parts of the state, who have come to attend a culling demonstration. Prof. H. P. Rusk opens the meeting with some figures on poultry production. "According to the 1920 census," he says, "Illinois has a hen population of 25,000,000 and grows 31,000,000 chickens a year."

If the entire poultry population of New York, New Jersey and Connecticut were added together, the sum total would amount to only one-half the number of fowls to be found in Illinois. The three eastern states combined grow only half the number of chickens that Illinois grows.

What a tremendous loss in pounds of poultry meat if a small breed should be substituted for the existing stocks of big breeds in Illinois and other corn belt states! And there would also be a big loss in both pounds of meat and number of chickens if the existing stocks of large breeds in the mid-west should be selected and bred for production of eggs regardless of fleshing qualities.

The meeting progresses. A Rhode Island Red cockerel is killed and his carcass used to demonstrate meat values as produced by egg-type hens. His long thin legs and slab sided body indicate poor fleshing quality.

A farmer from Ford county remarks: "That is the trouble with our chickens. They don't seem to have any meat on them this year. We have been culling pretty hard for eggs for several years, and I see now that we are losing the flesh qualities that used to be characteristic of our fowls."

The question of molt is taken up. The speaker says: "Anything that interferes with production, such as setting and rearing a brood of chicks, causes a molt. In culling the early molters you automatically cull out the broody tendency." In response to this statement J. W. Whisenand, live stock adviser of Iroquois county, says: "One of our farmers said to me the other day that he had had poor luck this year because his hens did not set early and his chickens were late. The hens kept on laying and would not set. He culled last year."

Poultry production with this farmer is going down because the broody tendency is going down. The egg temperament is winning out in that flock and the balance, characteristic of the dual-purpose type, is being lost.

A White Plymouth Rock hen is put in an exhibition cage and discussed. She is in new feather and her shanks are not faded to light yellow. The egg men would say that the outward signs are against her. But, she has good Plymouth Rock breed type. She is up to Standard weight, 7½ lbs. She is not a slab-sided, sharp-breasted, egg type. She is not a small, Leghornized Plymouth Rock.

The speaker of the day remarks, "You would make a mistake to cull this hen out of a corn-belt farm flock. The cockerels from this hen will grow big and weigh in heavy. The pullets will not start to lay so early that they never attain decent size. Fourteen such hens are worth a wagon load of corn on the market today. Every pound of chicken meat, bone and feathers in this hen's carcass will bring you as much money as a bushel of oats at current prices. And, this hen will lay. To get egg production out of her, talk feeding not culling, to her owner. Tell him to feed a scratch feed and make his hens work for it. Urge him to provide an animal protein supplement in the form of meat scraps, tankage, or sour milk. He does not need dairy-type hens with sharper breasts and less body substance. He can increase egg production by feeding and still maintain the superior flesh qualities of his dual-purpose stock."

We take the train back home. The more we reflect on the day's meeting the more we realize that so much emphasis is being laid on egg-type that there is danger of overlooking the actual value of the carcass when it ultimately reaches the market. There is danger of sacrificing those flesh qualities that are needed in the stock of the greatest poultry producing states of America. There is danger of making dairy Holsteins out of what should be dual-purpose Shorthorns.

The Young Birds

A hot, dry summer always results in more small chickens for the average poultry raiser. A year that the grass stays green is the easy year to get good growth.

More ventilation, actual open-air roosting quarters, more green stuff in the form of chard, sprouted oats or kale, more animal protein in the form of milk or meat scraps, are necessary when the air seems to stagnate over the chicken yard, the ground becomes baked and the grass dry and tough, and crickets, worms and bugs are scarce.

With the coming of September, development will appear to be faster. Chickens will make much more growth in the next four weeks than they have in the last six weeks.

Cut down weeds in the runs that soak up September rains and wet the smaller chickens. See that the roosting quarters are clean, for accumulated droppings will take up moisture and give off ammonia.

The early shows should contain a number of well developed, rather completely finished young birds this season. The hatching season was early and experienced exhibitors do not allow growth to become arrested as a result of lack of air during the night, insufficient green food, or rations deficient in animal protein.

Beginners should remember that half grown fowls should now get enough food. Do not carry more youngsters from now on than you can afford to full-feed.

Fowls in the leggy, half finished stage, are past the earlier trials of rearing, but they are not yet old enough to withstand the attacks of "bullying" from older fowls which result in them being crowded back at meal time. It is important that growing youngsters should go to roost with full crops, and that during the day they should enjoy contentment and feel at ease.

A New and Revised Standard

Robert Bakewell, who took the Leicestershire Cart Horse and made the English Shire; who converted the Leicester sheep into the modern broad-backed, thick-fleshed, easy-feeding, early-maturing, Leicester breed; who attained fame a century and a half ago in improving Longhorn cattle; Robert Bakewell, whose breeding establishment was visited by people from all parts of England and Europe for the purpose of buying seed stock at what were then fabulous prices; Bakewell, who has been termed the "father of live-stock hus-

bandry," is quoted as having said: "It is easier to pick twelve suitable men for cabinet positions in the government of the nation than to pick one good judge of live stock."

D. Lincoln Orr, W. B. Atherton, Theo. Hewes, as managers of great national shows, will subscribe to this opinion. They know the difficulties of selecting "one good judge" for each of their assignments. But, what would Bakewell have said of selecting good men to write standards which are to govern both judges and breeders? That is the biggest job in connection with the work of the American Poultry Association. We recommend to the Standard Committee that they pattern the standard of Bakewell, who set down four points to govern his breeding, "(1) breed, (2) utility of form, (3) quality of flesh, (4) propensity to fatten, the three latter depending on the first."

The Standard Committee will be on safe ground as long as all other points are made dependent upon breed, breed type and breed character. That was Bakewell's system, and the system of every great breeder who has since done constructive work in improving our domesticated races of live stock and poultry.

The Standard Revision Committee appointed by the Board of Directors at Seattle, consists of Theo. Hewes, Arkansas; E. C. Branch, Missouri; Walter Burton, Texas; A. C. Smith, Minnesota; Geo. Robinson, Canada; Harry R. Lewis, New Jersey, W. M. Coates, Washington. It looks as if geographical distribution of membership afforded the basis for appointment. It seems strange that no prominent breeder or judge at the great New York or Boston shows should have been included on the committee.

There never was a time when there was such need for a strong Standard Committee. Some of the specialty clubs have already prepared Standards for their respective varieties and are in position to issue their own Standards, independent of the American Poultry Association's Standard of Perfection.

Last month we presented the new idealized illustrations that the American Brown Leghorn Club has secured for emergency purposes. Herewith are reproduced the idealized illustrations prepared for Standard purposes for the Blue Andalusian Club of America. For years the specialty clubs have been helping to revise the A. P. A. Standard of Perfection. They have been content to abide by final decisions of the A. P. A., to let the A. P. A. derive all the revenue from the sale of Standards, and to get along the best they could as specialty clubs by collecting annual dues from members and issuing yearly club books containing booster articles on the breeds they championed.

The A. P. A. has had a monopoly on Standard making, due to the acquiescence of specialty clubs. The A. P. A. has boosted the price of its monopoly, the Standard, from \$1.00 to \$1.50, then to \$2.00, and now the price is \$2.50 per copy. Revenue derived from the sale of Standards has been the back-bone of A. P. A. finances.

The time has come when the Standard should be given wider distribution. Purebred poultry is being introduced onto thousands of farms, and every owner of a purebred flock should have a Standard which describes and illustrates the ideals to which his fowls should be selected and bred.

Breeders are beginning to chafe under the collar because the Standard of Perfection is not serving the wide and useful purpose that it should serve. A prominent Orpington breeder recently remarked: "Last spring I sold a pen of five birds to a party in Indiana for \$150, and this summer he wrote and asked where he could get a Standard for Orpingtons. That condition is too general. The Standard should go hand in hand with the introduction of Standardbred poultry."

Specialty clubs are giving thought to this condition, even preparing to meet it. The newly appointed Standard Revision Committee should consider this situation. The hopes of the fanciers must rest in this committee. Fortunately it includes some loyal fanciers who will not recommend radical changes and will strive earnestly to give the breeders what they want in matters of Standard text and illustrations. However, this is not enough and we recommend to the careful consideration of the Standard Committee the following words from the inaugural address of President Thos. F. Rigg:

"Sell the Specialty Clubs the privilege, say at 50 cents for each copy issued, of publishing in their year book, that part of the A. P. A. Standard which describes and illustrates their particular variety. Renew this privilege yearly.

"This would create an immediate revenue at no A. P. A. outlay, give the clubs something real to offer their members and provide a far wider distribution of the Standard than can otherwise be accomplished. Think what this latter means from an educational standpoint alone. *The greatest work of the Association should be and must be along educational lines.*

"Every complete or breed Standard the Association publishes becomes a liability until it is sold. *Every breeder should have and wants the Standard descriptions and illustrations of his particular variety. Keep in mind the immediate cash revenue from such a plan as this with absolutely no expense involved on the part of the A. P. A.*"

Some day the American Poultry Association may be interested more in the service it can render than in the revenue it can derive, and when that time comes we will find the widest possible distribution given the Standard of Perfection.

Theo. Hewes is on record as favoring one edition to sell at \$1.00. It has also been suggested that the complete Standard be published in parts so that a breeder might purchase a smaller and cheaper book and still get all the information which applies to his particular breed.

It is reported that a reproduction of the Standard printed in Spanish, is being sold in Mexico and South America for \$1.50, silver. The American Poultry Association is losing some revenue but the American breeders are being helped by the distribution of American ideas and ideals as some relate to purebred poultry. That means more exports of American Standardbred poultry. Let us think more about a wide distribution of the Standard in these United States and Canada.

The Standard committee should assume a position of leadership, and a big attendance of purebred breeders will certainly be on hand at Knoxville next year to endorse a constructive program.

Ideal Blue Andalusian male and female. Copyright by Blue Andalusian Club of America, and reproduced by permission. These illustrations faithfully portray the modern ideas of foremost breeders, and are a distinct advance over the Standard illustrations in the Standard of Perfection

Home Made Egg Records.

A report of the first year "Record of Performance" has been issued by the Department of Agriculture, Dominion of Canada.

The Canadian "Record of Performance" is supervised by the government. Poultrymen who desire to secure official trap nest records of their birds on their home plant may enter their birds for the nominal fee of \$5 for the first 25 birds and \$2.50 for each additional 25 birds. After entering birds the poultryman receives leg-bands from the government. He puts a band on each bird and then begins to make weekly reports of trap-nest performance to the government.

An inspector on His Majesty's Service calls on the poultrymen unannounced and at irregular intervals. If upon the first inspection the birds are found to be diseased, the houses or equipment not in sanitary condition, or the trap nests not of satisfactory design or not in serviceable working order, the entry is cancelled.

The inspector has charge of the trap nests and eggs during his inspection, and it is required that the fullest information shall be given to him. It is specified in the rules that "any entrant who offers opposition renders his entry liable to cancellation."

In a report of the results of the trap-nested birds for the past year, it is noticeable that several entries were dropped. Also a number of birds were not allowed to qualify because the owners did not file sworn statements of the year's production. Every safeguard is thrown out to make these home-made trap nest records reliable and trustworthy.

Birds to be eligible for entry must be pure bred and free from Standard disqualifications. To qualify and be granted a certi-

cate of production, signed by officials of the government, a bird must lay 150 eggs in 52 weeks. That is the minimum qualification requirement. Birds that lay 225 or more eggs in 52 weeks are recorded in the "Advanced Record of Performance."

Of the 4,436 birds entered last year, 15 per cent or 681 qualified for the Record of Performance, while a little less than 2 per cent, or 80 birds, qualified for the Advanced Record by laying 225 or more eggs during the year.

In looking over the list of entrants, we find the name of W. F. Garland, breeder of Silver Wyandottes, and one of the best fanciers in the Province of Ontario. He entered 25 pullets and 24 hens. None of them qualified for advanced certificates but 9 qualified for Record of Performance certificates with egg records of 153, 169, 177, 194, 198, 201, 205, 214 and 220.

In commenting on the first annual report of the Canadian Record of Performance for poultry, W. A. Brown, chief of the Poultry Division Department of Agriculture of Canada says:

"The objects of the Record of Performance for poultry are to encourage the breeding of Standard breeds of poultry along lines of greatly increased individual and flock production, and to secure for poultry breeders reliable information as to sources of high-producing pure-bred stock.

"The poultry industry has undergone many revolutionary changes and made very rapid advancement in breeding problems during the past few years. Previous to that time, the breeding of Standard breeds was very largely along exhibition lines. Latterly, however, the success obtained by representative poultrymen in the breeding of high-producing strains of Standardbred poultry has opened up a wide

REGALS "The Ideal Fowl"

"REGAL SENSATION 1st" Madison Square Garden, 1919

Regal Dorcas White Wyandottes have stood the test and may rightly be named the ideal all-purpose fowl. They are splendid layers of large brown eggs and have made wonderful records in the Official Laying Contests. They are a superb table fowl and mature much sooner than most other strains. Canadian Winters are severe but the Regals thrive and keep right on laying with the mercury 20 to 30 below. I raise, as a rule, between one and two thousand January and February chicks with practically no losses.

As an Exhibition Fowl the Regals lead all others. No strain has a greater record of winnings. My unbroken record of fifteen victories at the New York State Fair has not been equaled by any other strain.

WHY SEEK FURTHER? If you are thinking about starting in the Poultry Business your success or failure will largely depend on your choice of a breed. If you are already breeding White

Wyandottes and are not satisfied with your flock, give the Regals a trial. They have made money for me and they will do the same for you. Book your order at once, to make sure of delivery when you want them.

100 Acres Devoted to White Wyandottes. Free—Send for 20 Page Catalog and Summer Sale List, giving a description of over 1,000 breeders that I am offering for Sale.

JOHN S. MARTIN Box 51 Port Dover, Ont., Canada

Produce Both With Purina Chows

DO you know why Purina-fed hens lay more eggs right through the moult than those fed grain alone?

It takes lots of protein to make feathers and eggs at the same time. Feathers run as high as 85% protein. The whites of eggs are mostly protein. Grain rations never contain enough protein for even a poor layer before she moults. So it is easy to see why the hen on the average ration so quickly runs out of material for eggs when she moults.

Don't Rob Flesh to Make Feathers

If not fed sufficient protein, a hen will draw upon her body tissues for protein to make feathers. This leaves her in such bad shape that it takes months of good feeding to get her back to laying. You want egg production when prices are highest. Feed for feathers and eggs.

Protein Abundant in Purina Chows

Purina Chows are not just "chicken feed." They are scientifically selected materials built into a feeding system that supplies *all* the elements for both feathers and eggs. When fed according to directions, Purina Chows are guaranteed to *produce more eggs or you get your money back.*

See the nearest Purina Dealer and increase your poultry profits. If your dealer can't supply you, write us direct.

HAZELRIGG, IND.

PEACOCK'S S. C. W. LEGHORNS

Yearling and breeding hens at \$2.00 and up; yearling breeding cocks at \$5.00; young cockerels at \$2.00 each and up. These are from Ward's foundation stock, some of the heaviest producers in America today.—Peacock's Poultry Yards, Box 16, Winnebago, Illinois.

field of remunerative effort, so much so that breeders today are endeavoring to breed birds that not only appear well from an exhibition standpoint and perform well in the way of egg production but which will also pass on those traits to their progeny.

"A brisk demand sprang up for poultry of bred-to-lay strains. It was reported that unscrupulous breeders were taking advantage of the situation, some by advertising trap-nest records which were either fictitious, or made by birds of no relation to the stock for sale; others having exhibition stock for sale by representing the low-grade birds to be of bred-to-lay strains. The difficulty was to find breeders who had stock of real merit both from the standpoint of exhibition and production.

"It becomes apparent that some form of official record of merit for pure-bred poultry was necessary. It would serve two purposes: the emphasizing, as far as possible, of Standard utility characteristics, and the elimination of the false advertiser."

It had proven that enough was known of the external indications of production to enable reasonably accurate estimates of present and past production to be made for each bird. Thus efficient inspection and checks were assured.

To qualify for the Record of Performance, the hen must produce eggs that are not lower than the grade "specials" in the "Canadian Standards for Eggs," and average at least two ounces each in weight. Mere numbers of eggs are not alone sufficient; size and quality are considered.

In the race for numbers of eggs in American egg-laying competitions we here little of 2 oz. eggs, 24 oz. to the dozen. As a rule, eggs that run over 18 oz. to the dozen are counted, although in the market 24 oz. is the minimum for firsts, and 18 oz. eggs are pewees.

Eggs to be considered as firsts for either market or setting purposes should weigh not less than 2 oz. each, be shapely and strong shelled, and feel heavy for the size. Breeders who tolerate anything less will lose hatching qualities in their eggs and growing qualities in their chicks.

The figure on the birds that laid 225 or more 2 oz. eggs is illuminating.

There is today somewhat too much commonness in discussing 200 eggers. Just recently we received a circular from a farm that quoted eggs for hatching at \$21.60 per 30 dozen case, from "our 200-egg hens." As this farm claims to have upwards of 15,000 hens, the owners are in line to make a mint of money on eggs at market prices. They would need no protective tariff, even if the Chinaman gave away his eggs to the exporters.

In order to improve the flocks of White Leghorn breeders in New York State, Prof. Jas. E. Rice, head of the poultry work at Cornell University has undertaken to furnish cockerels from 175 and 200-eggs hens. The commercial Leghorn flocks in New York State are as good egg producers as those anywhere east of the Pacific coast, and the seed stock at Cornell are as heavy layers as is to be found at any state agricultural experiment station.

When 175 to 200-egg stock is used to improve existing flocks, there is still much room for improvement. It indicates the need of truth regarding production, rather than exaggeration.

A subscriber in Indiana wrote us in June that Professor Rice had been quoted in American Poultry Journal to the effect that a flock record of over 200 eggs was not to be found anywhere in the United States. Our subscribers, P. O. Dell, then gives a record made by 10 of his pullets from November 8, 1918 to November 7, 1919. During that year the 10 pullets laid 2,102 eggs in spite of the fact that one of them died October 1, 1919, and no substitute was put in to take her place.

That is a good record. But, it is not the record of a flock. It is the record of a pen of birds. It is not uncommon for 10 hens to lay 10 eggs in one day, but whoever heard of a flock of a thousand hens laying a thousand eggs in one day?

In ten years of trap nesting 10,000 hens at the Storrs contest, one 300-egg hen has been

found. Professor Rice of Cornell is optimistic about 300 eggs. He believes that the occasional ones today are only forerunners and that in time they will be as common as 200 eggers now are. Perhaps that is the way to look at it, for some will recall that it was not more than fifteen years ago that Theo. Hewes offered \$50 for a bona fide 200-egg hen.

The egg contest at Storrs, Conn., shows an average yield of 160 eggs per hen per year. This is the average of 10,000 hens that have been trap nested during the past ten years, 1,000 hens being entered each year. Professor Kirkpatrick of the Connecticut Agricultural College says that 160 eggs is about 60 per cent more than the average Connecticut poultryman gets. Professor Lewis says that New Jersey poultrymen average about 111 eggs per hen per year.

It remains true that the small poultry keeper has the advantage in making high egg records. The small man can get a bigger egg yield than the big man.

Method of Procedure in Culling For Eggs.

Time to cull farm flocks of poultry—July 15 to September 30. Culling should not be carried on later than September 30, except on more highly specialized poultry farms where modern methods of feeding are practiced, which tend to prolong production; and where the birds are hatched reasonably early and the general system of management is conducive to continued high egg production.

Make inquiries about, and observe, the system of feeding. If the ration is supplemented with animal protein in the form of milk, tankage, or meat scraps, production will continue later in the season and the hens will not dry up so early in the season. Egg production at all times is highly dependent upon the feeding methods employed, and continued high egg production throughout the summer and late into the fall season is dependant equally as much upon feeding methods as upon breeding and selection. Where the feeding methods are not conducive to continued high egg production, the recommendations that are made to the owner of the flock should be along the lines of proper feeding to supplement the work of culling.

Hens that are laying have a large, moist vent usually faded in color at the time the culling is done. Hens that have dried up have a small, relatively dry, yellow vent. In order to pick out layers, that is hens that are laying at the current time, reasonably accurate work can be done on the condition of the vent alone.

Do not pick out hens on the condition of the comb. It is very misleading. Some hens with relatively small combs are better layers than other hens with noticeably large combs.

On either side of the vent are two bones which form the pelvic arch. These bones do not always have the same thickness. Observe the bone nearest your right hand when the bird is held in the left hand. It should be reasonably straight out. The two bones when pressed gently together should be rather pliable rather than rigid and hard.

The flesh of the abdomen below the pelvic bones should be soft and flexible. The abdomen should be soft, like the udder of a cow after milking. Examine particularly for this softness, rather than for mere size of abdomens. All hens with tight or hard abdomens should be culled out.

The distance from the pelvic bones to the end of the keel bone should not be especially emphasized because the shorter the keel the greater the distance. The hens with short keels are not able to hold their abdomens in as good form as those with longer keels. The result is that a big, well-developed abdomen on a short-keeled hen is very apt to hang and become baggy. Instead of emphasizing Hogan's original measurement from the pelvic bones to the end of the keel bone, later investigational work has shown that the depth of the hen should be measured by placing the thumb of the right hand on the hip of the back and the middle finger on the rear end of the keel bone behind the drum stick. In this way you span and measure the whole barrel of the body and are not misled by a

KEEP THE LAYING HEN.

Recommendations by Agricultural Ex-
periment Station, University of Wiscon-
sin.

Culls.

1. Poor layers and all old hens.
2. Cripples and hens with broken-down abdomens or frozen toes.
3. The sick, quiet, inactive hens that spend much time on the roost.
4. All "crow heads" with long, slim heads and beaks.
5. The large, coarse-headed hens with sunken eyes.
6. All very short, stubby hens with feathers extremely heavy for their breed.
7. All late-hatched immature pullets and those that are early hatched but much undersized.
8. All hens that molt before August 1.
9. The persistent sitter.
10. All hens with solid, fat abdomens.
11. All hens having bad habits (cannals, feather-pullers, egg-eaters.)
12. All cockerels not needed for breeding purposes.

Keep.

1. Strong, healthy, vigorous hens with

short, neat heads and strong beaks.

2. The hens with long, deep, rec-
tangular bodies and parallel top and bot-
tom lines.

3. The hens with large, bright eyes,
active appearance and short, well-worn
toe nails.

4. The hens with dusty, worn feathers,
especially worn tail feathers, but having a
bright, healthy look.

5. The hens that molt late.

6. The noisy, happy, friendly hens.

7. The early risers and those late to
roost.

8. The vigorous hens with the faded
beaks and shanks.

9. The hens with the soft, pliable ab-
domens.

10. The hens with the thin pelvic bones
spread wide apart.

11. The early-hatched, well-grown pul-
lets.

12. Large, strong, active, quick ma-
turing cockerels of desired variety, type
and high-producing mothers.

short keel. The deeper and more slab-sided
the body is the better. The depth depends
somewhat upon the size of the bird. It is
good depth, relative to the size of the bird,
that is desired.

The back is widest at the hips, and natu-
rally narrows as it approaches the rump. The
ideal conformation of the good layer includes
carrying the width of the back from the hips
well back to the "parson's nose" or rump.
On top, the back should be reasonably flat
and not round down too much from the hips
to the rump.

Observe condition of the molt. Anything
that interferes with production, such as set-
ting or short rations, causes a molt. Hens
that continue to lay do not molt early. Hens
that dry up early molt early. The molt is
an outward sign of egg production value.

The second outward sign is pigmentation.
As hens continue to lay they utilize the fat
that would otherwise replenish the yellow
pigment in the beak, shanks, and vent. The
pigment in these sections seems to wear off.
This is commonly referred to as "laying
out" the yellow pigment in the beak, shanks
and vent. This faded condition is particu-
larly noticeable in White Leghorn hens that
have been persistent layers for the White
Leghorn is not heavily pigmented with yel-
low. The pigmentation test is not applica-
ble to mixed breeds or to breeds that natu-
rally have white skin. It is not highly val-
uable in estimating egg production in Plym-
outh Rocks, Wyandottes and Rhode Island
Reds that have plenty of range and green
food. The pigmentation test was developed
and was largely used in the East where
White Leghorns are cooped under more or
less intensive conditions on large commercial
egg farms. While it is well to notice pig-
mentation as well as molt, culling should not
be based on any one of these factors. The
man doing the culling should observe all of
the signs and his judgment should be based
on a combination of all of them.

Review of a Book.

"Poultry for Exhibition" is the title of a
new 176-page book published by the Relia-
ble Poultry Journal Publishing Company. It
is written by John H. Robinson and illus-
trated by Franklane L. Sewell and Arthur
O. Schilling.

The text covers the subjects of growing,
conditioning, training, exhibiting and judg-
ing pure bred poultry, and provides a fund
of information to breeders.

The variety and charm of the illustra-
tions make the book of surpassing inter-
est and value. The photographic reproduc-
tions of cooping, handling and washing birds
are like a moving picture of a fancier in the
poultry yard. On one page, for example,
John S. Martin is shown in eight different
pictures taking a fine White Wyandotte male

out of a training coop and returning the bird
to the coop. What a splendid privilege for the
new breeder to see an experienced fancier
skillfully handling a bird worth a hundred
dollars, in which a single broken wing or
tail feather would mar its chances of win-
ning.

Still more interesting than the educational
illustrations are the historical pictures. "Old
Champion," that famous White Plymouth
Rock male, purchased by William Barry
Owen from Harry Graves for \$1,500, is
shown. His like had not been seen again
until, 16 years later, at the New York show
of 1921, Owen Farms exhibited the wonder-
ful first prize White Rock cockerel.

On another page there is an intimate pic-
ture of Edward B. Thompson sitting alone in
his fitting room with a Barred Plymouth
Rock cockerel on his knees. We cannot all
go and visit Mr. Thompson at his home in
Amenia, but this picture carries us there, and
then takes us into the laboratory of the great
breeding establishment, and we see the mas-
ter breeder of the world sitting in solitude
in his workshop studying the straightness of
the bars, the cleanness of the white, the
blending of a color too much like soft velvet
to be called black.

Franklane Sewell, the world's premier poul-
try artist, has given of his genius and his
unequalled collection of poultry pictures to
make this book great. Like Mr. Thompson,
he has only one eye, yet the infinite detail
that these men see! Who needs two good
eyes more than they? Yet, handicapped, they
excel in observation and appreciation of that
detail and refinement which makes of them
great artists—one a breeder artist, the other
an artist who portrays and puts in enduring
form that which must otherwise die and com-
pletely pass away.

And now, as we turn the pages of the
book, we make a round of the poultry shows.
We stand in the gardens at Sydenham and
look over on the glistening glass dome of the
Crystal Palace building where the Palace
show is held in London, England. We look
into the interior of the Portland, Me., show
of 1878, and see the canvas covered coops
with fronts made of round wooden rods. We
stand on Madison avenue and look up at
the high tower of Madison Square Garden as
it beams forth those two magic words "Poultry
Show." We enter the Garden and meet T.
A. Havemeyer and Billy Stanton, H. V.
Carward and Captain Griffith, D. Lincoln
Orr and Charles V. Cleveland. The next
page carries us to Huntington avenue in
Boston and Mechanics Building bids us enter
and view the birds in Boston show. Then
the pictures carry us on to the Chicago
Coliseum, Hagerstown, New York State Fair,
Indianapolis, etc.

The book contains many good likenesses
of the numerous men who, as breeders and
judges, have contributed so greatly to stand-

BUY YOUR POULTRY FEEDS DIRECT FROM THE MILL

Better Feeds *for* Less Money

One of the big problems that has always confronted the poultry raiser has been the question of getting real high grade feed at a price he could afford to pay.

Our plan of selling direct from mill to user has changed all this—you can now buy BASIC FEEDS—feed made from choicest Feeding Stuffs, milled and correctly proportioned, at prices that net you a big substantial saving over the usual retail way of buying. Not only is the first cost of BASIC FEEDS considerably less, but the results obtained from feeding these feeds (which are 100% feed) show profit gains that mean much to every poultryman. Emil Wenberg says: "Basic Feeds have enabled me to reduce cost per bird \$1.07." Alex Davidson writes: "Of all the feeds I have used Basic Feeds give best results." We receive similar reports from users everywhere.

BASIC FEEDS FOR POULTRY

consist of Chick Feed, Chick Mash, Growing Feeds, Laying Mash and Scratch Grains. For years we have been supplying the leading poultrymen of America with these feeds made from formulas that have become recognized throughout the poultry world as standard. The successes that have followed the use of BASIC FEEDS have become so well known that the demand has been constantly increasing. We have added to our Mill capacity and are now able to do what we have planned to do for years—to give to every poultry raiser, large or small, the opportunity to save money and get better feed, by ordering direct from our Mill and saving all profits of middlemen.

Whether you buy 100 lbs. at a time, or a car—it makes no difference—we can supply you promptly and guarantee you a big saving. Furthermore, BASIC FEEDS are guaranteed. If after giving them a fair trial you are not more than pleased with results, we will gladly refund your money.

Write for Free Descriptive Folder and Price List

Get our free folder describing the famous line of BASIC FEEDS—learn how they are made entirely from Standard Feeding Stuffs—the choicest the world affords, and sold direct to you at prices never before possible. Don't delay. Write for free folder and money-saving price list NOW.

ALFRED F. GRAHAM

CAMERON, N. C.

ard bred poultry in the last 60 to 70 years, which period practically covers the lifetime of the pure bred poultry industry in the new world.

Judges are shown at work. Well known judges of the past, and a majority of the leaders of the present, are shown in pictures. Some have passed from active work, but they live in the pages of this book. There they stand, duster on, bird in hand, judging in the aisles.

This new book "Poultry for Exhibition" is a noteworthy contribution to poultry literature. Instead of an industry of traditions, we emerge today, by virtue of this book, as a purebred breeding industry with recorded history. The history has been preserved before it was too late.

The publishers, in conceiving and executing such a volume, have plainly treated time and dollars as if they were sacred things; time because of its inevitable limitation; dollars because of the good that they can be made to do.

Eradicate Lice in Early Fall.

Lice are the common parasite that infest poultry. The hen louse has biting mouth parts. It lives on the feathers and scales of the skin. It does not live and breed on horses, cattle or man, and although it may pass to other animals for a time, it will crawl off.

The eggs of lice, called nits, are deposited and attached to the fluff or under part of the feather. They are often seen when the feathers of the fluff are examined.

The fluff plumage covers the abdomen of a fowl, and if a fowl has any body lice, they are usually most numerous on the abdomen and in the fluff plumage. The supposition is that lice travel to the vent for moisture and are therefore most numerous on the abdomen below the vent. There also appears to be more external matter or debris to serve as food for lice, on the skin of this section of the body. Poultrymen, therefore, in examining for body lice, always pick up a hen and, holding her in one hand, part the feathers of her fluff with the other hand, and look for the hosts that have been uninvited.

A hen that becomes fat and inactive usually falls prey to lice because she does not wallow and dust herself sufficiently. If her fluff feathers are matted with nits or lice eggs, these will hatch in 6 to 10 days into small, light colored active-moving lice.

It is well at this time of the year to thoroughly dust hens with lice powder so as to free them of body lice before their new plumage is grown. Then follow with a second application at the end of a week, and if the bird was badly infested at the beginning it may be necessary to make a third application.

Every young bird should also be dusted with lice powder at this season, whether any lice are to be seen or not. Always apply by the pinch method. Cut the top off the can of powder and then taking a pinch of powder work it into the neck, another pinch under the wings, one on the back, then the breast, and then the underbody and fluff. The poultryman who does not take the time to do this will never grow the best chickens. He will not have either the best bone or the best type when show time comes around.

Use lice powder on young chicks.

In ridding hens of lice, commercial ointment is also commonly used. It is more lasting in its effect than powder. A number of ointments are on the market, all of which are highly recommended. An amount about the size of a pea should be smeared on the skin of the abdomen an inch below the vent.

This paste is more satisfactory for use after birds have been put in winter quarters and cannot get on the ground to wallow dust and dirt into the ointment which has been applied to their skin.

As Seen by an American.

John Tomlinson of Detroit, who has been in England, says that English Rhode Island Reds are deficient in breast and comb shape and in wing and undercolor. That is true of practically all English varieties. In seeking size they overlook breast and comb. In judging birds without the same careful handling indulged in by American judges, they pass undercolor and wing faults to an astonishing extent. Because they have poor wings they also have poor hackles, especially in their Columbian varieties. However, they want a white base to their Columbian hackles, which is consistent with their Standard.

The Wishbone's the Mammoth that Saves Most Space Makes Most Money

It gives you most capacity for any space! It uses less fuel than any incubator made! To operate it takes the least amount of labor—the smallest amount of time per egg capacity ever known to the hatching business.

It is the time-tested, long established, mechanically and structurally RIGHT machine.

It produces the finest, healthiest, heaviest chicks you could ask to see—and actually lowers the cost of your chicks per thousand!

No hand turning of eggs—no cooling. You put in the eggs and you never touch them till the chicks are hatched. Turning device enables you to turn 100,000 eggs in two minutes. Automatic ventilating system keeps each compartment absolutely right—and automatically cools the eggs. Ask any Wishbone user—we'll tell you the nearest one.

The wonderful new Wishbone Heater is furnished with every machine. It cuts fuel cost in half, because it gives the same heat with half the fuel. Burns coal, gas or oil.

For new equipment or to increase capacity of your present equipment, get Wishbone prices first. Write for handsome new catalog today.

Lowest Cost Per Egg Capacity
PRICES REDUCED.

Wishbones cost less per egg capacity—and that's the only way to judge incubator costs. Increased volume and lower cost of materials have made lower prices possible, and we've cut ours to absolute rock-bottom.

You Won't Get Any

eggs to sell at high prices this winter unless you have clean, sanitary living-quarters in which to keep your hens. Sickness and disease usually start in unclean quarters, and in such quarters lice and mites are always more plentiful. In the winter when your flock gets less fresh air and sunshine, it is more important than ever that you keep the buildings clean.

CARBOLA
The Disinfecting White Paint

is used by thousands of poultrymen in all parts of the country to do their whitewashing and disinfecting in one operation. It is a white paint in powder form, combined with a disinfectant many times stronger than pure carbolic acid. It is harmless to the chicks and is ready to be used the minute it is mixed with water—no waiting or straining. It can be applied with a brush or spray pump and will not clog the sprayer. It does not blister, flake or peel off. It does not spoil after it is mixed with water and has no disagreeable odor.

Use It Instead of Whitewash and Disinfectants

Give Carbola a trial. It will save you time and labor and turn a disagreeable job into pleasant, rainy-day work. It will make it easier to do work that must be done.

The dry Carbola will be found effective in controlling lice and it costs about one-third as much as many other powders sold for this purpose. Spread the feathers of the bird affected, and apply the dry powder direct to the flesh. If necessary to repeat the application, do so at intervals of ten days.

Your Hardware, Feed, Drug or Paint Dealer has Carbola or can get it. If not, order direct

CURRENT NOTES AND COMMENT

The Tariff.

The Fordney Tariff as it now stands calls for duties of 6 cents per dozen on eggs in shells and 15 cents on dried eggs.

Fifteen cents on dried egg albumen is equivalent to only 2 cents on shell eggs. The committee on protection of the poultry industry, of which Prof. Jas. E. Rice is chairman, is now working for a higher rate on shell eggs and more equitable rates on the different forms of dried eggs.

When it comes to the practical politics of the situation it appears reasonable that Congress is trying to establish import duties that afford some protection and at the same time provide revenue for a heavily burdened treasury. A tariff high enough to bar out a commodity produces no revenue to the government because no importations are made. It is not likely, therefore, that an actually protective tariff will be adopted by Congress.

It is to be hoped duties will be granted on dried eggs that are based on the quantity and value of shell eggs used in producing the dried commodity, as it is the dried product that has been coming in large quantities from the Orient. It appears that importers would agree to almost any duty on shell eggs if they should be permitted to break eggs in cheap producing countries and ship them into the United States at a relatively low tariff on the dried product.

Eggs for Pellagra.

The cumulative effects of low prices for cotton bring the threat of famine and plague to 100,000 people in the cotton belt of the United States. Pellagra is the dreaded disease; a skin infection with severe constitutional and nervous symptoms.

If these poor cotton growers would keep one cow, and drink her milk and eat her butter, they would get enough vitamins to correct their dietary deficiencies. But these cotton growers do not keep even a single cow. They are one-crop farmers.

One crop works out nicely when the crop is good and prices are high. If the crop fails or prices are low, trouble ensues. This applies to all single crops, whether cotton, corn, dairy, poultry or fruit. Diversified farming of grain and live stock, or cotton, grain and live stock is the safe, profitable, permanent system. The south is waking up and talking more live stock. But unless the banks advance the money, the poor cotton grower is too poor to buy a cow.

Hens will help him. An egg a day will keep pellagra away. The yolk of the egg, like milk, is rich in those vitamins which are necessary to induce good nutrition. Hens are cheap to get, cheap to care for and would help save the hundred thousand facing semistarvation in the south.

Pellagra is a deficiency disease that arises from a diet of pork fat, white bread, oleomargarine and molasses. It is not contagious like measles and small-pox, and active cases respond quickly when the diet is changed to butter, milk, eggs and whole wheat bread.

Eat a good ration. Eat eggs and a fat chicken now and then.

Two million babies a year are estimated to die in India. The mothers are too weak to give them proper nourishment after birth or give sufficient strength and vitality to the growing embryo before birth. These mothers, in common with all the people of India, do not eat meat. Chickens would help to solve their problem, also.

* * *

Chicken Pox.

Heavy rains and unseasonably cool weather are advancing the fall season as much as a month, and there are indications of chicken pox on the combs and faces of cockerels in some flocks of early birds. Scrape off the whitish crust on the pox and swab with a solution made of 1 pint of boiled strained soft water in which a 7-grain tablet of bichloride of mercury has been dissolved; then powder with borax.

munity to help hold a rousing old-time poultry exhibition this winter. Mr. Hallet says: "This is the time of year to get together, meet with the boys and lend your personal aid in promoting one of the best shows ever held in your community. Just because you exhibit at the big shows don't forget that once you were a beginner and didn't like to go up against the big ones. Make it possible for the beginner to have a place to show by helping the boys hold an old-time poultry show. Lend your encouragement and advice and don't forget you are dealing with the beginners and they need encouragement. What would interest them might not especially interest you. Remember how you used to ponder over the score cards in days gone by? Ah, those were happy days. They were days that filled you with inspiration, enthusiasm and gave you that chicken fever which has never been cured. The same kind of interest, enthusiasm and fever is still in the old score card system. Get out among the boys again and do your little bit towards holding an old-fashioned show this fall and winter. The time is ripe. There are many new recruits who have raised their first poultry this season. Some are located in every community. Hunt them up, encourage them and get them interested in exhibiting their birds. They need help now if ever and your experience will be of great benefit to them."

"Futures" on the Egg Exchange Cause Trouble.

The egg exchange in Chicago was closed for the day, Wednesday, August 10th. All kinds of wild stories were afloat. An investigation disclosed that when eggs on Tuesday went down from 35 to 33½ cents, one firm which was heavy on the "long" side had to put up a check for \$25,000 to cover its loss on the falling market. The check came back from the bank not certified. This meant that the clearing house committee had to meet the default, and protect all deals that had taken place against loss on the heavy transactions of the one firm. It took some time to meet the situation. The market opened on Thursday at 33¼ cents which was the closing price on Tuesday.

Use New Cases and Fillers.

Never use second-hand or once-used cases and fillers for shipping eggs. If it should ever be necessary to use a second-hand case, by all means put in new fillers. After paste-board fillers are once used, the edges become sootened and bent and thus lose their strength.

The loss to the nation today as a result of eggs broken in transit is \$5,000,000 a year. Two million dollars were paid by carriers last year in settlement for damaged eggs. Many claims are not paid because many shippers disregard the rules of the railroads and express companies. Moreover, it is reported that some manufacturers are selling fillers and flats that do not comply with the requirements of the railroads and express companies which specify that if the ordinary honeycomb filler is used all the flat dividing boards and tray fillers must be of hard calendered strawboard weighing not less than three and one-half pounds to the set of ten trays and twelve dividing boards, each of which is to be of sufficient size to fill the compartments and prevent shifting.

In addition to watching the quality of the fillers used to protect the eggs, shippers can do two other things to reduce practically to a minimum the damage claims. First is the use of an additional excelsior pad in each side of the case, and a pad can be put above the top layer. This seems to furnish a sort of cushion, takes up unusual shocks, and prevents shifting.

Commercial Feeds.

The average poultry breeder owes much of his success to the mixed feeds that he is today able to buy at fair prices. These feeds contain the elements necessary to promote complete development in young birds and egg-production in mature females. Before their general introduction, the young bird classes at the fall shows were filled with smaller, poorer birds than greet the visitor today; and egg production was decidedly limited in the average poultry yard.

There are people, unhappily, who hate successful business and term every man who commercializes an idea as a quack. But, poultrymen who can today buy ready mixed feeds, honestly made and honestly sold, owe a debt of gratitude to feed manufacturers and the men who have put into actual every-day practice the dream of making available in every city and hamlet of the country finely blended feeds that contain in proper propor-

Read this extract from a letter from Mr. H. A. Daniels of Grafton, Mass., a successful breeder of Pedigreed S. C. R. I. Reds:

W. R. Curtiss Co., Grafton, Mass.
Ransomville, N. Y.

Gentlemen: Kindly quote me at your earliest convenience on Cut Clover in not less than 3 ton lots.

Will say that I find this to be the finest feed for poultry there is. It insures sufficient bulk to the ration and adds greatly to the splendid fertility of the eggs. Have shipped eggs for hatching to every State in the U. S. this past season with excellent results as to fertility and vigorous chix.

Very truly yours,

H. A. DANIELS

We also have a few excellent pullets and surplus cockerels and Mammoth Pekin drakes for sale.

W. R. CURTISS CO., Prop.

Does Your Incubator turn out such Hatches?

Hardin, Mont.,
June 24, 1921.

Simplicity of operation; minimum fuel consumption; actual holding of a uniform temperature, and last, but not least, the hatching of vigorous, healthy chicks with an average of 80 to 85%, are some of the reasons why I prefer the Newtown Giant.

ROY A. SMITH,
Big Horn Poultry Co.

Corvallis, Oregon,
April 9, 1921.

The 18,000-egg incubator we purchased from you has been giving us splendid results; the last hatches are running better than 80% and the chicks are exceptionally strong.

We are very much pleased with the machine and are counting on putting in another double-deck machine 15,000-egg capacity, besides the other machine. In addition to this, I have several customers that are talking of going in with me and have a car or two sent out this summer.

J. A. HANSON.

Rahway, N. J.,
June 28, 1921.

In regard to my incubator, beg to advise you that I have obtained 82% hatches for the season, of all eggs set. My contest pullets now at the N. Y. State Egg Laying and Breeding Contest were Newtown hatched and raised. This is Pen No. 10.

I regard the machine a profitable investment and labor saver and you may look for a new order soon, as we intend to increase our capacity.

CEDARHURST PLTY. FARM,
per A. TRUDEL, MGR.

Glen Rock, Penna.,
June 20, 1921.

The 4800-egg Incubator that I have is doing fine. Never tried it on extra hatches but had 80 to 85%. The demand for baby chicks is good and custom is very good. I cleared about \$550.00 this season.

H. B. GOODLING.

In the hands of Newtown Giant Incubator users, actual results exceed our claims. The evidence is before you—other letters in last month's announcement.

The Newtown does all you can expect or get from an incubator. You're absolutely safe when you buy a Newtown. Tell us size of machine you can use and we'll make you an interesting proposition. Write or wire, but do it at once.

NEWTOWN GIANT INCUBATOR CORPORATION
21 Warsaw Street
Harrisonburg, Virginia

Odessa, N. Y.,
July 21, 1921.

My hatches for the season averaged 73%, the best average for one hatch was 80%, and the best for one compartment, 90%.

I can tell you very frankly that I regard the incubator as a good investment and wish that my other 6,000 machine was a Newtown. Your machine beats the other one every time by about 200 chicks.

HARVEY J. COUCH.

Westholme, B. C.,
July, 1921.

The 12,000-egg Newtown machine purchased from you has given great satisfaction, and hatches up to 79% of all eggs set were obtained during the past season.

L. F. SOLLY,
Lakeview Farm.

Auburn, Ind.,
June 29, 1921.

We have been operating a 9600-egg size double-deck Newtown Incubator the past season with fine results. We have had some hatches run as high as 92%, and stronger chicks we have never seen.

Will say our incubator is the most profitable investment we have, and we are contemplating installing another 8400-egg size machine for next year.

GERIG'S LEGHORN FARM,
R. A. GERIG.

Honley, Huddersfield, England,
December 28, 1920.

With reference to your delivery to me this year, of a Giant Incubator for 4200 eggs, I must confess it has been of service to me as I have hatched 80% of fertile eggs, using 12,600 eggs.

ALBERT MESSENGER.

Tupelo, Miss.,
June 21, 1921.

I hatched 5,000 chicks that were sold, and took in \$600 custom hatching, which I found to be profitable, and I am sure will greatly increase another season.

I found the 6,000-egg capacity Newtown Giant Incubator easy to operate, and that it secured most excellent results.

J. M. MORRISON.

tion the right elements to produce good growth and high yield.

* * *

Ex-President Cooper.

A. F. Cooper took the office of President of the A. P. A. when no one else wanted it. He saw an opportunity for service, and did the best he could to meet conditions and fill the job with credit to himself and to the industry. He received no help, but from the beginning met with criticism on every hand.

The office of President is no worse off than when he was elected. The association has lost prestige, but only a super-man could have stemmed the tide. The finances are in better shape than when Mr. Cooper took office. It would be too bad to let this good man pass out of the highest office within the gift of the purebred poultry breeders of America, unnoticed, and without a word of appreciation for doing his very best. Therefore, Mr. Cooper, let us, in our humble way, thank you for having given to the Association all that you had to give. No one else has done more.

* * *

Production Classes.

Who asked for "production classes" in all shows? It was not Harry M. Lamon. He has never asked for "production classes" in which to show Uncle Sam's purebred chickens. He has held breed type to be inviolate.

It was not the breeders of Standard quality Barred and White Plymouth Rocks, Silver and White Wyandottes, Buff and White Orpingtons, Light Brahmas and Dark Cornish. These breeders know the reasons for the popularity of the dual purpose type which they breed.

It was not the breeders who have been loyal to the precepts of the Standard, and have bred and exhibited Standard White Leghorns. These breeders know that their birds also lay, and they also know that it takes a higher order of intelligence and breeding ability to combine many valuable points in one individual than it does to produce just utility Leghorns.

What shows would provide "production classes?" Not the shows under the management of Theo. Hewes, namely, Chicago Coliseum, Indianapolis, Cincinnati, Buffalo. Not the shows under the management of D. Lincoln Orr, New York and Washington. Not Boston or Baltimore!

These shows are not held under A. P. A. rules, and the A. P. A. has no jurisdiction. The Seattle convention displayed good judgment in passing the resolution not to include the "production" chapter in the Standard.

* * *

A Back Yard Flock.

Back lot poultry keepers are having a splendid year. Geo. Jennings, Illinois, reports that in July his 43 White Leghorn hens produced 63 dozen eggs, which had a market value of \$22.05. The feed consumed by these hens during the month, together with 64 growing chickens 3 months old, cost \$9.00. The birds had all the feed they wanted for we have not seen larger White Leghorn chickens for their age.

Mr. Jennings killed 8 lbs. of young chickens during July, and he could cull out other young males if he were simply interested in running his plant efficiently; but he is growing out a number of cockerels to see how they develop for his birds are not strictly utility chickens.

* * *

Willard C. Thompson.

Willard C. Thompson has been made Professor of Poultry Husbandry at the New Jersey College of Agriculture, succeeding Prof. Harry R. Lewis, who resigned to take up farming and poultry keeping in Rhode Island. Professor Thompson is well trained for his new duties, and has the confidence of both the breeders and commercial Leghorn farmers of New Jersey. He has done noteworthy work particularly along disease lines at the New Jersey station.

* * *

Black Head in Turkeys.

Geo. A. Cosgrove writes in The Rural New Yorker that a remedy for blackhead in turkeys has been discovered by two doctors in San Diego, Cal.

As a preventive the dose for 20 turkeys is a teaspoonful of powdered ipecac in the mash twice a week. For a sick bird the dose is 10 drops of fluid extract of ipecac three times a day for three days, then twice a day for two days, then once a day for three days.

BARKER'S

PRATTS 50TH YEAR OF SERVICE

P-102

Buff Leghorn Type.

When asked the question, "What is the proper type for the modern Leghorn," it always brings to my mind a little incident that happened some years ago when a veteran judge from Cincinnati was judging our local show.

He was asked by an enthusiastic Buff Leghorn breeder, what shade he preferred for a Buff Leghorn male. The judge replied: "I want 'em boof." So I am tempted to reply, I want 'em Leghorn.

The real Leghorn is a sprightly, classy fowl from what ever angle you view him. True, we are breeding them with slightly smaller combs, longer backs and longer tails, but we must be careful not to carry these points too far lest we lose real Leghorn type. Too small a comb gives them the appearance of lacking in

Buff Leghorn male of good type bred by Mr. Roberts.

stamina and vigor, which qualities should stick out in looks and action all over a Leghorn. I do not like the description in the "Standard" of "back slightly rounded at shoulders." This gives the impression to many that a narrow, pich-shouldered bird is the proper thing, when on the contrary, a Leghorn should show strong and broad at shoulders, which is always an indication of vitality and a strong constitution in any breed of fowls. Then the slight slope to center of back and from there, the graceful, increasing concave sweep to tail is the proper thing.

The breadth of back should be carried well back to a well spread tail; saddle and coverts to abundant, avoiding a pinched, narrow appearance at saddle and a thin, shingle shaped tail.

The breast should be full and rounded and carried slightly forward, giving the bird a proud strutting appearance.

Thighs and shanks should be of good length but not stilty. Wings carried well tucked up, not carried low at sides of thighs like a Seabright bantam.

Leghorn breeders, to win at the modern shows, know they must adhere to these real Leghorn points and let the rest of the world go by. They will have to come back to get in among the winners.

Wisc.

D. E. Roberts.

An Investment in White Plymouth Rocks.

(Continued from page 813)

where the hen stood when ready to be released. Small nests cause broken eggs and the starting of the egg-eating habit, and they also tend to frighten the bird and make her nervous. A good comfortable nest invites her to return, and it will usually be found that a hen will use the same nest day after day.

Have a sufficient number of nests to accommodate all the hens that may lay. Most eggs are laid during morning hours. For my Rocks I furnish one trap nest for each four pullets. For lighter breeds perhaps one to five is enough.

Locate the nests so that they are easily accessible. I wanted mine within a foot of the floor, so that the Rocks did not have to fly way up to get into them. True, it was more work to stoop over to tend them, but I wanted the hens to have conditions about them that would induce the biggest production possible.

Always keep the nests perfectly clean, dry and free from vermin, such as lice or mites. I like coarse pine shavings for nest litter. This litter was replenished frequently and the nests always smelled and appeared sanitary.

Arrange the trap nests so that ventilation is possible, for during the hot summer months some valuable hens may die of heat prostration. One of mine did, and then I moved the nests. We live to learn.

Visit the nests several times during the forenoon to release the hens that have laid. It means less loss.

Keep a record of each individual hen as long as she remains in the pen. One can learn a lot by looking over a hen's pedigree or egg record after a year's performance is ended.

The Egg Record.

Well, the White Rock pullets went through the year following that Nov. 1 and most of them gave an excellent account of themselves. Twenty started. Four died during the year. One was an accident and two were cases of ovarian tumor (these two never produced many eggs) and the other bled to death after developing a case of prolapsis of the oviduct, due to a heavy egg production in the spring. The sixteen lived on, and as a matter of fact are still living. One old scallawag in the flock never laid but 39 eggs during the year. She was the only one which did not lay at least 100 eggs. It was mighty fortunate that the trap nest located that individual, because from external appearance she might have been picked as a hen worthy of keeping another year. Trap nesting is as valuable in spotting poor ones as it may be in finding the record makers. That 39 eggger made a good pot pie, and that is the best I can say for her.

It is exciting to watch the total egg production as the year advances and as records mount toward the 200 mark; and I found,

quite to my pleasure, that six of my White Plymouth Rock pullets had made that goal of 200 eggs or more. Here is the record. It is a true statement of their production. I never would have known which was which, or that I had any 200 eggers if I had not trap nested.

No. 1 laid 234 eggs.	No. 11 laid 105 eggs.
No. 2 laid 236 eggs.	No. 12 laid 124 eggs.
No. 3 laid 200 eggs.	No. 14 laid 157 eggs.
No. 4 laid 159 eggs.	No. 15 laid 252 eggs.
No. 6 laid 181 eggs.	No. 16 laid 224 eggs.
No. 7 laid 109 eggs.	No. 19 laid 182 eggs.
No. 8 laid 110 eggs.	No. 20 laid 221 eggs.
No. 9 laid 110 eggs.	

My fifth flock to good pullets laid 2,604 eggs. I was satisfied. I reflect back as to reasons why this flock succeeded. Probably a lot is due to the feed and environment provided and in the daily care and management, but it is my belief that we cannot get a high average egg production by management alone; we must breed birds with the capacity to lay and then feed and care for them right.

Now, I'm going to give you a few of my humble opinions, gathered from watching these little old White Rocks:

It pays many fold to get good stock, even if it comes rather high.

Plan and carry out a definite breeding program for the improvement of the flock each year. I have a son of No. 15 and you can guess that he is being reserved to head a breeding pen this next season.

Onwards the hens which begins to make her record early. This is precocity. No hen can make a record as did No. 15, for example, which did not start early. The late starter will never have time to make so high a record. My 39-egger did not start until spring came. The good record makers have a high intensity of production, that is the average egg production for March, April and May is above 26 eggs. It is interesting and important to note the correlation between high intensity and high yearly performance.

The star producer must eternally keep at it. The record of No. 15 is given here. She didn't go on vacation, did she? She had persistence down to a fine point, and so did the other 200 eggers.

This is just a bit of my experience. It proved what I always thought, to-wit: that the American breeds offered some splendid possibilities as egg layers. It isn't so much the breed or variety we keep as it is the strain or family we develop within the breed or variety. But keep records and trap nest your birds and have a sound basis on which to develop your strain.

Many people do not know of a good preventive of diseases among poultry, and there are others who use Permanganate of Potash. But the following recipe is a fine one for a general preventive of diseases, and especially fowl cholera. Get one ounce of sulphuric acid of your druggist and put in a gallon of rain water, and if any of your chickens are sick use one quart of the mixture to two gallons of drinking water. G. A. Ward.

The Individual Performance Record of Mr. Thompson's White Plymouth Rock Hen No. 15 shows precocity, intensity and persistency of production. This hen earned the right to be used as the foundation of a line of high egg producers.

There's the Scratch Feed to Feed and

Here's Why

It's really surprising how many poultry raisers there are who are very particular about their Growing Mash and Laying Mash, but seem to think that most any old kind of Scratch Grains will do. That's just where they make a big mistake. While it is true that Scratch Grains alone is not the proper feed for egg production—it is the maintenance ration and if bidly is going to keep in trim, it's very important that the Scratch Grains are the *very best quality*.

That's why Ful-O-Pep Scratch Grains are the kind to feed—they contain *twice as much wheat* as the next best Scratch Grains on the market and *three to four times as much* as most others. *Ful-O-Pep Scratch Grains never vary—always the same—our formula does not change with fluctuations of the grain market.*

Quality More Important Than Quantity

Don't let price influence your choice of Scratch Grains—good feed costs money, but it pays big dividends and the only way to judge values is by results. Ful-O-Pep Scratch Grains considered from the standpoint of results are by far the cheapest scratch grain on the market. Made of choicest grains correctly proportioned. There is absolutely no waste—your birds eat every kernel—every ingredient is palatable to the fowl and contains the utmost in feed value. Ful-O-Pep Scratch Grains are a part of the famous Ful-O-Pep Way and are absolutely essential to get best feeding results.

SAMPLE FREE ON REQUEST

Go to your dealer and ask him to show you Ful-O-Pep Scratch Grains, or if you would like to have a sample to compare it with other feeds, fill out and mail coupon below and we will send it postpaid.

Announcement Extraordinary!

FREE FUL-O-PEP Poultry Course to

All

FUL-O-PEP

Feed Patrons

"The Man Who Has the Key to Poultry Success"

Think of it! A complete poultry course by one of the country's best poultry experts absolutely free. It won't cost you a cent. Next to giving to poultry raisers the famous Ful-O-Pep Feeds, we consider this free poultry course one of the biggest things we have yet done to promote the interests of the poultry raiser. This course is for the sole benefit of Ful-O-Pep customers. It consists of over 50 lessons dealing with a complete study of the great subject of successful poultry raising. Here are some of the lessons and bulletins:

The first lesson—The Commercial Egg Farm—Breeds and Varieties—General Purpose Type—Egg Type—Meat Type—Principles of Breeding—Natural Incubation—Natural Brooding—Brooder Houses and Equipment—Poultry Houses and Equipment—Care of Breeding Stock—Feeding and Management for Egg Production—Selecting the Laying Hen—Increasing Egg Production by Illumination—Marketing the Commercial Egg—The Day Old Chick Industry—Feeds and Methods of Feeding—Feeding Equipment—Growing and Marketing Broilers and Roasters—Feeding Young Chicks for Quick Maturity—Capon and Caponizing—Poultry Diseases, Treatment, Cure and Home-made Remedies—Sanitation—Fattening, Killing, Dressing and Packing—Conditioning and Exhibiting Fowls—Preserving Eggs for Home Use—Poultry Secrets Disclosed.

The above are only a few of the many subjects covered in this complete course—a course that treats on and fully covers every poultry problem from A to Z.

To secure this Poultry Course Free, simply go to your dealer, hand him the coupon below properly filled out, giving him the order for Ful-O-Pep Dry Mash, Growing Mash or Chick Feed, just your regular order, same quantity as you are accustomed to buy. Your dealer will sign the coupon. You mail it to us and we will send you your first lesson with text and list of questions for you to answer and so on, until you have received the entire course of more than 50 lessons. This service is free only to those who use Ful-O-Pep Feeds.

Expert, Albert Angell, Jr., has devoted his whole life to mastering the poultry business. He has helped thousands to succeed. He will help you. Take coupon to your dealer and start **NOW** to take advantage of one of the biggest opportunities ever offered to poultry raisers.

Buff Wyandottes.

By W. S. Crandell.

Mr. Platt has asked me to write about Buff Wyandottes and tell all I know about them. Perhaps the conclusion drawn from my having bred them continuously for 16 years would seem to justify a personal knowledge that would be of great value in breeding to standard quality and also assure me of all prizes in any competition.

The contrary is true. In the first place I have never bred as good Buff Wyandottes as I know can be bred and in the second place no variety in this country has more efficient or more interested breeders than these same Buff Wyandottes and what they do to the "sure thing" in the show room is scandalous.

Buff Wyandottes of today can wisely be scheduled as "Wyandottes (Buff)." They are true in shape, color and general characteristics. Every time they have made a bid for popularity someone has taken them up and exploited anything they could palm off on the public and all other flocks have been judged by this quality.

The breeding of Buff Wyandottes true to shape and color is done by few and a very determined move is on foot to have these few loosen up and deliver the goods. We howl when the huckster operates under the guise of a fancier but none of us would pitch in and rear good birds to supply the demand.

For the good of breeders of the present and those considering, let me make this plain: Do not take any stock in any talk about color being easy to get. Do not believe this talk about "old gold" being proper and light buff no good. One breeder who has lately come into the game and made some winnings where competition was light is preaching this gospel to get rid of some stock that is of no real value for breeding Standard birds, and he ridicules the pure buff color which he cannot get, following the line of least resistance and palming off the stuff on people who will later refer to Buff Wyandottes as "culls." There is no such thing as "old gold." Nobody can breed it and keep any soundness of color. Nobody can win with it if buff birds of equal quality are shown against them.

There is nothing about the Buff Wyandotte that stands out pre-eminently over other Wyandottes unless it may be the coloring. When people get mad they "see red." When they are sad they assume black and when either of these gets irksome or gruesome they can find relief and comfort in more soothing shades. There is nothing more pleasing to many of us than a smooth, even, dirt-and-stain-defying Buff. The only thing detrimental is the labor and time to produce and hold it. My recipe for starting is a history of my own endeavors.

In 1906 I bought four females and a male as good in every way as could be had. These birds were the foundation and future breeding of my flock. I never tried to blend colors. I took males and females of the shade of buff that was clean, smooth and even. I paid strict attention to type, eye, leg and general purpose qualities.

For many years I bred from too large males and made a mistake doing it. Females seven pounds and males of about same weight. Plenty of cushion on females and not too short on back and shank. Males with deep breasts, good combs and vigor. I never paid any attention to how closely inbred if color and shape were in conformation. I had no use for any black or pepper in tail or wing which should be sound in color if a trifle darker in shade. I reiterate—mate Buff to Buff. No red, no "old gold," no lemon. Just buff.

Now you will wonder after all the hardships I have enumerated what you will get out of it. Good specimens of Buff Wyandottes for breeding can be purchased in females for \$20 to \$30 each, males for \$50. Pullets for general purpose bring as much money as any variety because they are first, last and always layers. There has never been a time when the market on either grade could be filled.

How can you get in right? Write the secretary of American Buff Wyandotte Club and take out a membership which entitles you to all services necessary and then advise with any one of the executive officers on what you want and use their advice.

Most of the trouble is caused by doing the job backwards. First satisfy yourself that you want Wyandottes, then settle on the buff color and after that place yourself in a position to deal with all possible knowledge by paying out a couple of dollars for club membership. This Two Dollars will be worth more than any money you can spend.

Proof of my sincerity of the foregoing is 16 years interested breeding of the one variety and more interested in them today than ever. Properly started with Wyandottes (Buff) you cannot fail to get profit and pleasure.

Dandelions For Green Food.

Do you believe in the value of green foods? Listen! They are of a twofold value to your poultry flocks, whether large or small. I have been experimenting with greens for two years now, trying to increase the flavor of the eggs. This is what I am doing. I make it my business to gather all the dandelion leaves I think my back yard flock will eat once a day at noon. They become so accustomed to this feed that they look for it. I have noticed in eating our eggs that the yolks have become very yellow in color and have a very palatable taste. Before I tried this method my eggs did not show this richness in color or have the rich taste. This is the first real value of green food.

The second is in regard to the health of the flock. My young chicks receive their dandelion meal cut fine at least twice a day. They relish it very much and seem to crave it. This year I hatched fifty-seven chicks and today I have fifty-seven very fine specimen. I give the above food all the credit. It seems to regulate the digestion and in that way promote the growth of the chicks. As a matter of fact the young that I have will today leave their grain mixture lay to eat up the green I provide. I also am led to believe there is a cooling value in the above feed that we cannot see.

Pennsylvania.

G. W. Gerhard.

PROFITABLE LEGHORNS

Queensbury trap-nested pedigreed Pullets are raised on free range in small flocks—that means vigor, the biggest factor for success with poultry. And the years of breeding back of every Queensbury Leghorn means the ability to lay eggs, plus vigor.

If you want that combination, order your pullets, cockerels, and yearlings now. Our prices are reasonable.

Whenever you see this trade mark remember that Queensbury Leghorns are guaranteed to please you.

1000 Eggs In Every Hen

If You Keep Chickens, Cut This Out—Four to Seven Eggs a Week Per Hen Through Cold Winter Season. With Eggs at a Dollar a Dozen, Means \$5.00 Profit Per Hen in Next Six Months.

Amazing Poultry Secrets Revealed By

AMERICA'S FOREMOST POULTRY EXPERT

This is an offer no reader of this paper who keeps chickens can afford to ignore. We will tell you why.

Henry Trafford, Famous Poultry Expert and Breeder for nearly eighteen years Editor of "Poultry Success," has developed a new and remarkable system of rearing, breeding and feeding chickens for heavy egg production that seems certain to revolutionize the poultry industry and give five eggs or more for every egg produced today. This plan or system is explained in Mr. Trafford's "1,000 Egg Hen," a free copy of which will be sent to any person who keeps six hens or more.

Poultry keepers, following Mr. Trafford's directions, learn how to start young pullets laying early; make old hens moult quickly and resume heavy laying during entire winter season. Most any hen will lay in spring when eggs are cheap. Mr. Trafford tells how hens lay four to seven eggs a week during coldest winter days when eggs sell at a dollar a dozen or more. His system shows how any breeder, with ordinary care, may get 1,000 eggs or more from nearly every hen in four to six years' time at a net profit of \$25.00.

There is big money to be made with chickens this winter by the man or woman who gets the eggs. The time to get the hens ready for heavy winter laying is now. Mr. Trafford's "1,000 Egg Hen" system tells how and arrangements have been made whereby any reader of this paper may receive one copy absolutely free by using the Coupon below. Send no money, but cut out the Coupon and mail it with your name and address to Henry Trafford, Tyne Bldg., Binghamton, N. Y., and the story of the 1,000 Egg Hen will be sent you by return mail.

Starting a Poultry Farm.

(Continued from page 816)

Third: The sale of older stock, such as half grown pullets, mature pullets, layers, breeding males and females. With good stock and a little attractive advertising you can soon build up a good business—it will pay you famously.

Fourth: By selling broilers, roasters, and last, but by no means least, capons. Profits from the latter are especially good when the fowls are handled and marketed properly.

The wise poultryman is selling something every month in the year — not simply in the spring.

Should I Grow My Own Feed?

Only if you have the labor facilities and time to do so economically. Most poultrymen raise their own greens, both for summer and winter needs. But unless you have a fairly cheap labor supply it is better for you to devote your acreage and time to the production of chickens. Many poultrymen in the past have made the mistake of cramping the range of their old and young birds, so as to grow some corn or other grain. It is better to give young fowls more range and buy more feed. A crowded pullet never develops properly, and then no matter how well fed, she will not produce heavily. On the other hand, a range-grown, husky pullet will produce a profit on a reasonable amount of feed. If you can't raise both chickens and feed at the same time, drop the feed raising. You are primarily in the chicken, not the feed raising business. Many of our most successful poultrymen raise only their green feed. They find it pays to concentrate and specialize on one thing—chickens.

When May I Expect a Profit?

Expect no profit the first year, if you start in the spring. If you start in the fall, your pullets should lay enough to pay for their original cost and perhaps something besides. But do not expect them to pay entirely for buildings, etc. First they must be fed, and second they must feed you before they show a profit. By the second fall, with your second lot of pullets coming into production, you should be making a profit. When your 1,000 birds are producing properly, and you are selling to advantage, you should make a good living, with increasing profits as your experience and reputation increase. Some poultrymen make \$5,000 per year from 1,500 fowls, but they are experts, and that takes time. This you will attain also if you apply yourself and develop your business.

How Much Money Should I Make from 1,000 Hens?

It again depends. Certainly \$1.50 per bird per year over and above all expenses is not too high an estimate. And \$2 to \$2.50 per bird per year should be the profit on a well-managed poultry farm. But when we begin to hear of large flocks making \$3, \$4 and \$5 per hen per year—well, we're beginning to get into fancy, not to say, fanciful figures. I am glad to admit that there are some poultrymen who show such a profit, but they are the exception.

All of these estimates and ideas are based upon the assumption that the reader desires to enter into the poultry business upon the 1,000-hen scale. In

NOW READY!

The New SUPER SOL-HOT Heater

**The Greatest Improvement Ever
Made in Poultry Heating Equipment**

For several months past I have been telling the readers of the Poultry Journals that I would soon have an important announcement to make—an announcement that would be of vital interest to every user of Incubators and Brooders.

Here's the good news—I have at last attained what I have been striving for for years—to perfect an oil control device that was absolutely automatic—one that entirely eliminated the necessity of human control. I have it this season—it's the most remarkable achievement of recent years in poultry equipment. That's why I have rechristened it the SUPER SOL-HOT.

COMPLETE DESCRIPTIONS AND ILLUSTRATIONS IN NEXT MONTH'S ADVERTISEMENT

Our printers are now printing a new catalog folder describing this wonderful new improved heater—our advertisement in Poultry Journal next month will also show illustrations and descriptions. If you are interested in a heater that requires no adjustment—one that only requires lighting the burner—one that won't go out—won't overflow—one that is absolutely automatic, then you'll be delighted with the new Super Sol-Hot. Watch my ad next month.

Here's Another Big Winner This Season

The MUL-TI-DEK SECTIONAL INCUBATOR

When I designed and perfected this Sectional Baby Mammoth Incubator, I felt sure that I was perfecting a machine that would meet the requirements of a vast majority of poultry raisers.

Since my advertisements have appeared describing this Multi-dek Incubator, there has been a tremendous response from poultry raisers everywhere, asking for my new folder describing this popular machine. The Mul-ti-Dek "Add a Section As You Need It" idea just exactly fits in with the average poultry raisers requirements. You don't have to spend a lot of money for big expensive mammoth machines.

Beginning with one 250 egg section, you can add extra sections up to 2000 egg capacity, all heated with one heater, my famous Super Sol Hot. These sections can be operated all at one time or one or more sections can be operated independently of the others. It is the ideal equipment for poultry raisers who want to start with one 250 egg section and add extra sections as their business grows.

Write Today for Free Mul-ti-Dek Catalog Folder

My big, free illustrated catalog folder tells all about this practical, efficient and economical Baby Mammoth Incubator—tells how it is built—gives you full working plans, showing how you can build it yourself and save considerable money. Tells also how it is operated and why it is one of the most simple and efficient incubators on the market.

Just fill out and mail coupon below or send me your name in a letter or postcard and I will send you catalog free by return mail.

most cases it would be far wiser to start with half or even one-quarter that number the first year and gain experience sufficient to make the 1,000-hen plant a safe venture and not an unsafe one. You can always expand into a "man-size" plant soon enough. If you have enough to live on for two years, it is best to go slowly and learn at less expense than to plunge in full tilt.

The Jump from the Back Yard to the Poultry Farm.

A great many people make a fatal mistake in their jump from their back yard enterprise to a larger one.

They have figured a profit on their fowls based upon the feed consumed, but usually nothing else is taken into consideration. They forget, in some cases, that when they enter the business on a basis of securing a livelihood that their hens must hereafter carry all of the financial burden.

A merchant takes it for granted that before he can show a net profit, he must figure on rent if the building is not his, building investment if it does, interest on all of his capital invested,

overhead, such as labor, taxes, insurance, and other unavoidable costs. The commercial hen has therefore quite a load to carry. She must lay enough eggs to pay for her feed, for her home, for her care, and for the money invested in her and her equipment. Also she must be able to pay for every other expense involved which contributes directly towards her maintenance. The cost per hen per year takes a very decided jump from the back yard to the poultry farm. Not to forget that she must also support you and your family.

If you are a back yard poultryman, it will hardly cost you more than \$2 each year for each of your hens. This will jump to \$3 per hen per year on a commercial poultry farm. Poultrymen in the famous Petaluma district of California, count that sum as the fixed upkeep charge, and they know what they are talking about. Perhaps with feed now lower, and with other expenses dropping, it will not come to quite that figure, but you can safely double your previous upkeep charge.

The modern poultryman certainly has a much easier time of it than the man

of even 10 years ago. Let us review some of your possible blessings and advantages if you go into the commercial poultry business.

1. A Standard of proper housing for all climates and locations has been developed, so that you may choose and choose safely. The questions of ventilation and proper housing in general are well understood today. (Write your state agricultural experiment station for plans of poultry houses.)

2. Methods of culling and selecting of layers and breeders that are of great help to the inexperienced poultryman. What a source of sure profit that can mean!

3. The use of artificial illumination during the winter months to stimulate egg production. When this is properly understood and applied it means the difference of many dollars in a year's income. Even five years ago this was not countenanced by many poultrymen, but is now accepted as one of the new standbys of the poultry business.

4. More good literature and information available than ever before. Dull indeed the man who cannot glean much

ANNUAL SURPLUS YOUNG AND OLD STOCK SALE

1889

Parks' Bred-to-Lay Barred Ply. Rocks And-do-Lay

Now Celebrating Their THIRTY-SECOND ANNIVERSARY

They have Utility and Beauty combined, and have to their credit about all the World's Rock Laying Records. Miss Graduate, 313 eggs yr. Lady Martha 323 eggs yr., 400 eggs 448 days. Miss Smarty 325 eggs yr. Flock of 126 averaged 208 eggs, and they out-layed over 2500 birds in Five Months Laying Contest, etc. They've simply layed their way into Universal Popularity, and will win your affections if given a chance.

CHOICE SELECTION OF YOUNG AND OLD STOCK

At prices that come only once in 12 months. 16 Page Surplus Stock Circular Free. Large General Catalog 25c. Shrewd buyers come early, as we have to disappoint hundreds of late comers each year, and at the rate inquiries and orders are coming in, we will be sold out of surplus birds earlier this year than usual.

MATAWAN, NEW JERSEY

help, just for the small effort of a little systematic reading.

5. Better selling methods, especially in those progressive poultry states that are working along co-operative lines. In such states the selling of table eggs automatically takes care of itself, and the poultryman can bend all of his efforts towards greater production. Another great help, and becoming more widespread as time goes on.

6. Better strains of breeds from which to select foundation stock. More really good poultry farms producing good layers.

7. More honest business methods. What a change from a few years ago—and constantly improving. The poultry business no longer rests under the cloud of employing questionable business methods. There are too many high class men connected with the enterprise now—and more joining the ranks each year.

8. More active legislative interest throughout the country, giving the poultry industry an equal footing with other live stock interests. This is as it should be, and will become still better when poultrymen learn to ask for what is their due, and are able to show the nation's law makers that the poultry business should be looked upon with proper regard to its vastness and economic importance.

Surely, with all of these modern advantages, coupled with all sorts of reliable information regarding the feeding, and care of poultry from earliest in-

fancy to maturest years the new poultryman has been given many tools for the fast and sure upbuilding of a successful business.

A Few Suggestions.

Have enough money, or at least have it available if you need it.

Buy only good foundation stock. Be guided by someone who knows, and by your common sense. Poor stock is worth less than nothing.

Pick out a poultry location that will allow for growth, as well as for plenty of room for your present flock.

Be sure you consider the matters of proper soil, drainage, water supply, roads, transportation, and social and educational facilities for your family, if you have one.

Expect to work hard, for you must put in a good many hours of "overtime" if you are to be successful with chickens.

Hire as little outside labor as possible—it eats up profits quickly. Plan your work so that you can handle everything alone, whenever possible.

Read one or two of the best poultry magazines, and some good poultry books, or take a good correspondence course in poultry husbandry. Secure the bulletins from your state experimental station or agricultural college and absorb all of the suggestions and results of experiments. Don't try to read everything about chickens, because you won't have time. Make each reading hour count.

Attend your local poultry show and exhibit a few birds, even if only in the so-called "utility" or "farm flock" classes. Get acquainted, and see what the other folks are doing, and learn from them.

If you need the services of a poultry expert to get you started right, don't be afraid to pay his price. He may save you hundreds of dollars, and perhaps give you enough suggestions and real help to jump your business a year ahead.

When you get ready to breed, don't fail to know what you are really doing with your stock. Here so many people make mistakes. If you aren't sure—and most of us aren't the first season or so—get someone who knows how to help you. You can spoil the best strain by improper breeding methods.

After you have read all of these suggestions, and have gone over the various questions asked and answered, and considered the cost of entering the poultry business, both from a financial and personal application standpoint, ask yourself the question, "Am I really fitted for the poultry business, can I see it through to a successful conclusion, and will I like it well enough to stick through thick and thin?" If you can answer these in the affirmative, you have an excellent opportunity—never better—for engaging in one of the most interesting, healthful and substantially profitable agricultural pursuits the world has to offer.

Now is Your Chance to Get Started with PURITAS SPRINGS LEGHORNS

that have been acknowledged by every one of our satisfied customers from all over the UNITED STATES as the world's greatest Winter layers, and a strain that cannot be equalled in quality as well as beauty.

As I cannot devote all my time to the Poultry Business I have DISSOLVED PARTNERSHIP. Now offering my entire half of trap-nested, pedigreed stock of COCKERELS, PULLETS, and HENS, with high egg records at prices that cannot be equalled anywhere.

PURITAS SPRINGS LEGHORNS have been trap-nested for ten years without missing one day with scientific line breeding combined, this has made them reign SUPREME in Egg production of today.

**If you want FIRST CHOICE of these great egg producers
order at once, your wants from this ad.**

Like "STERLING" on Silver.

Wouldn't It Tickle YOU?

Suppose you were to take a practically unknown breed, work over them day and night for year after year, and watch them fight their way to leadership. And then suppose that after you had spent thousands of dollars making your Trade-Mark popular, wouldn't it tickle you if one of your customers were to "come through" with this?

*The name "Sheppard"
to Anconas is like
"Sterling" on Silver
to me.*

Well, It Pleases Me Too!

I know though that my "Famous" Anconas deserve it. They have a consistent record over a long period of years of Big Wins at Madison Square Gardens and other leading shows. Another "Famous" characteristic is the ability to lay large white eggs the YEAR AROUND. And their brilliant black and white plumage, set off by the snappy red of their combs, makes them real beauties.

In Fact, SHEPPARD'S "Famous" ANCONAS

are an all-around breed. They have the beauty, they lay the eggs, they win the prizes!

You send me your name—I'll send you my fine big catalog. By the time you've put in a few extra nests, I'll try to have the birds you've ordered on the job—ready to lay eggs all winter long!

Judging Purebred Poultry in the Shows.

(Continued on page 817)

the respect of both management and exhibitor. Exhibitors and judges should be cordial, if not friendly in their relations. Most exhibitors appreciate a judge's opinions expressed to them after he has placed his awards. It satisfies and pleases them, and incidentally adds greatly to the judge's popularity. This is especially noticeable when, after the judging is over, some enthusiastic young exhibitor who has made his first winning in fast company, eagerly listens to the judge's comments on his exhibit. Even a sorely disappointed exhibitor will calm down and hob-nob with the judge, when the decisions have been properly explained to him.

Exhibitors are Good Sportsmen.

Exhibitors at poultry shows are usually divided into three classes, namely: fanciers who breed and exhibit for pleasure and recreation; commercial poultry fanciers who depend on their winnings in the show room to sell their stock and eggs; dealers who buy and sell but seldom breed the birds they exhibit, caring only for the money they bring to their pockets.

The true fancier, whether a big commercial breeder or a small man who exhibits for the honors only, knows when he is beaten fairly, and seldom if ever will dispute a decision made by a competent judge. He may want to know something of the comparative merits of the winning specimens as well as of those he has entered, and no judge will fail to answer all reasonable questions put to him. In the poultry show we will find among exhibitors both good winners and good losers. The good losers are the real good fellows, win or lose. Being such, they are good fanciers and true sportsmen. They live up to the words of Oliver Wendell Holmes:

"To brag little, to show well,
To crow gently if in luck—to
Pay up, to own up, and to
Shut up, if beaten, are the
Virtues of a sporting man."

Judges and Judging.

There are so-called "born judges" who possess the eye for selecting winners not only among poultry, but among most all classes of live stock. Others again acquire the art of judging by hard study and thorough experience. Both may pass muster, but the man with an inborn talent for spotting winners at a glance has a great asset to begin with, although it may lead him astray through overconfidence and snap judgment should he depart from the Standard ideals and follow so-called advanced types of his own.

The judge who, by careful study and observance of Standard requirements, becomes an all-round adjudicator of poultry, is usually a safe man to entrust with any class, as he rarely, if ever, cultivates any fads or allows the Standard type to escape his judgment.

But whether a judge is a born or made one, quick yet accurate judgment and first yet full impressions when examining competing specimens will govern him as a rule. First impressions are usually the best, provided all other points are equal. But not until the judge has had long experience by continual handling and examination of the shape and color characteristics of the breeds and varieties in his yards and in the show room, will he acquire the faculty of spotting a winner with any certainty or rapidity. He must keep in touch with the birds, so to speak, at all times. What is more, he should make most of the good qualities of whatever specimens he handles. True judgment dictates that we should see the fine points first, in order that possible defects, especially minor ones, may not be unduly valued and warp our judgment of the specimen as a whole.

Judges differ in temperament, the same as other human bipeds. That is where the feathered biped in the show is "up against it." Grand type and superior surface color will catch the eye of one judge and make such a lasting impression on his mind that he will discount hidden defects to the point of minimizing them, and the chances are a bird possessing these two most valuable visible assets will capture the coveted blue ribbon. Another judge will begin picking a specimen to pieces hunting for defects before he has a true picture of the outstanding cock, hen, cockerel or pullet in his mind, with the chances of such a specimen losing a high place in the awards due to magnifying minor defects.

It is true that our Standard is rather severe in its color restrictions as applied to many varieties, but this should not unduly influence a judge. The bird in doubt should invariably be given the benefit of the doubt in regard to such defects, which too often apply more

to a breeding male or female than to exhibition specimens.

Well Balanced Judging.

As an example of this tendency to magnify a fault in one section and at the same time fail to size up the rest of the bird properly, I may cite a case of when I judged and placed four S. C. Rhode Island Red cockerels belonging to one exhibitor at a show down South last fall. The exhibitor thought his fourth prize bird should have beaten the second prize cockerel. On being asked why, he replied: "The fourth is sounder in color and the second has white in his neck." In comparing the two cockerels again, a little white was found at the base of one hackle feather only, while in surface color there was but little choice, albeit the fourth was more even in top color, but failed utterly in shape. All the breeder and exhibitor could see was that minor defect in undercolor of the neck in the second and the top and under color of the fourth cockerel, losing sight completely of the shape, which was more pronounced in typical breed type in the former than in the latter.

At another show—a leading one in the East—several years ago a Rhode Island Red cockerel was placed second, although conceded to be the star male of the class by breeders and exhibitors present. He lost the blue ribbon because of a little black ticking in the neck hackle, a minor defect when viewed from either a breeding or exhibition standpoint, considering his many other superior properties in shape and color. Here was a cockerel that was almost ideal in Standard shape and color, and he was sought by other breeders, but not for sale at any price. The owner knew his priceless value as a breeder and exhibition specimen, which had been proven by the cockerels sired by him during the past two years.

The perfect Standard male or female does not exist. Defects will be found in the best specimen ever bred or produced. But such defects cannot be allowed to overtop all other good qualities, which will lead only to prejudicial judgment on the part of exhibitor and judge.

The American Standard of Perfection lays down the rules for cutting for defects, and these must be reasonably interpreted and followed if we are to do justice to both the birds and the exhibitors when passing judgment in the show room. As one old fancier once remarked: "A judge who really likes a good bird will not spend all his time looking for submarine cuts."

A confirmed defect hunter, however, is a mild proposition when compared with a disqualification sleuth. The latter is in his element when digging down in the poor little bird's body and legs, endeavoring to find foreign color—natural or artificial—a measly bit of down or incipient stub, even going so far as to use a magnifying glass when his own peepers fail to convince him of the presence of any or all of such disqualifying properties. Many a fine specimen has lost a prize in the show room because of an exhibitor's oversight in not removing a disqualifying feather, stub, bit of down or even a pinhead size of a side spri!

Technical Disqualifications.

But the august adjudicator who specializes as a disqualification expert is the monarch of all he surveys, for the American Standard of Perfection hands him the club to do business with. Until some of these disqualifications are dropped or greatly modified in the Standard, this questionable practice of discarding many of the choicest exhibition and breeding specimens for trivial color faults, especially in the under sections of a fowl, or for down or stubs located above the shank proper, we will find instances of grave injustice done to superior specimens of many varieties.

Standard laws on disqualifications, like all other arbitrary laws, invite violation. In the poultry world they are directly responsible for faking. The experienced exhibitor knows how to get around such laws but the amateur breeder does not. Every judge knows and regrets that such is the case.

To see an outstanding White Orpington, White Wyandotte, or any other surpassingly beautiful male or female of any clean-legged breed or variety, disqualified for a speck of down between the toes or on the shank, is enough to make the red blood of every good fancier run up to fever heat. It is, in my opinion, the greatest mistake, if not crime, ever made by our Standard makers. I violate no confidence, when I state, that experienced all round judges, with very few exceptions, as well as many of our best fancier-breeders and exhibitors believe the disqualifying clause applied to down and stubs should either be changed into defects or modified considerably in order to prevent the useless slaughter of the unfortunate feathered bipeds that will

There isn't a person in the country, anxious to have *better* success with poultry but who will find this book, "DOLLARS AND SENSE IN THE POULTRY BUSINESS" a sure guide to real success and bigger profits.

Contains 96 Pages; Fully Illustrated

This splendid book was compiled under the personal supervision of Prof. T. E. Quisenberry, who is intimately known throughout the Poultry Industry as one of America's Foremost Poultry Authorities and Expert in Poultry Culture. He is the originator of simple, easy-to-follow methods that have been applied by thousands with astounding success. Every method, every short-cut outlined in this book, has been tested and tried by Prof. Quisenberry in his official work as Director of the American Poultry Experiment Station, and as Manager of the American Egg-Laying Contest, which represented 25 States and 6 Foreign Countries. These

READ THIS PROOF!

HAD 28 HENS TO BEGIN WITH.

"I have up to now sold about \$400 worth of stock and had only about 28 hens to begin with and have all of the old and best pullets left and also about 30 cockerels. Your method speaks for this."—Henry Simmel (Texas).

DIDN'T MAKE EXPENSES BEFORE.

"I will care considerable money on my chickens. I had 20 hens when I began this spring. Before I started studying your methods I didn't make expenses. I have Buff Orpingtons."—Fred Summerlott (Iowa).

THESE METHODS ARE BEST.

"After years of breeding poultry and reading the best obtainable poultry literature, I will say conscientiously the books 'alone' in your Poultry Course are by all odds the best I have ever read and are cheap at any price."—Harry Richards (Illinois).

Keep This Hen—

Don't Kill the Laying Hen! Market the Loafers and Non-Producers; Save Feed

Do you know how to select the good layers and how to cull out non-producers? Do you know how to save feed? The Quisenberry Method of Culling is fully outlined in the book referred to in this announcement—and it is **FREE**. Use the coupon below and mail at once for your copy.

Send at Once: You need the information given in this valuable book—and you need it NOW. Don't delay getting this book into your hands and knowing all about the simple, practical course outlined that is positively guaranteed to turn failure into success; eliminates loss and piles up biggest profits. Simply use the Coupon.

valuable secrets were first offered to a limited number to be tried under every-day conditions, without previous experience. Their success was immediate! Then Prof. Quisenberry was urged to prepare his practical methods for general use so that many thousands throughout the land could enjoy the same success heretofore confined to experts only.

Remember, every plan outlined in this book is **practical** and easy to apply. There are no theories—no fanciful ideas—no "freak stunts." There isn't a single method outlined that is not worth a lot of real money to you.

Culled Out 207 of One Flock

"After studying your simple methods, I culled out 207 non-profitable fowls from a flock of 447 hens belonging to Mr. King. The 240 hens layed 396 eggs, while the 207, or almost half the flock, layed only 13 eggs."—J. M. Grant (Indiana).

For the Experienced as Well as Beginners!

No matter how much experience you have had—no matter how little you may know, you can use the secrets outlined to remarkable and profitable advantage. And you can master these secrets during your spare time. Join the 30,000 in the United States, Canada and 18 Foreign Lands who are applying the "Quisenberry Way" day after day, every month in the year, regardless of conditions.

hibitor's yard to the show room.

Standard Exhibition Versus Production Classes.

The fact that the American Standard of
Perfection is now undergoing a complete re-
vision, should prove to be the time for paying
more heed to the real functions of exhibitors,
and judges in the show room. Exhibiting and
judging poultry is of too great importance in
the American poultry world to be handicapped
with impracticable laws and provisions in the
Standard. The more rational the laws are the
more practical will be their application.

The Standard is the guide for the exhibitor
and judge, if not for the breeder. It can
only set up the ideals in shape and color of
the breeds and their varieties, which the ex-
hibitor strives to approximate as closely, as
possible, and which the judge should have in
mind when passing judgment in the classes
assigned to him. That is as much as the
Standard can demand of both, as long as ex-
hibitors and judges follow and obey its rules
and do not violate its laws.

To add other provisions to the Standard
involving the breeding or laying qualities of
exhibits is getting away from the fundamental
principles of the American Poultry Associa-
tion and the real purpose of the American
Standard of Perfection. The breed type must
remain inviolate if any race of fowl is to
endure as a thoroughbred. The color of a
breed or sub-variety is equally inviolate in
this respect. That is why exhibition classes
at our shows must measure up to a fixed
Standard in shape and color.

To add so-called production classes to the
Standard will create dual Standards and result
in confusion. It will only serve to widen
the gaps between the fancier and the utili-
tarian, retard the progress of the standard-
bred fowl and flood the country with alleged
utility strains of Standard breeds or varieties
that in many instances are a libel on the
breed or variety they resemble in name only.

No man living can have a greater respect
for utility than I have had in the past and
still have. But it is utility that goes with
a Standardbred fowl I refer to. It was my
business years ago when engaged in dairy and
poultry farming in Orange county, New York,
to produce, buy and sell eggs. The class of
trade I sold to demanded the best only. That
best could only be produced by the best
breeds for laying and by proper selection and
breeding for egg production. The best rec-
ords were made by Light Brahmas and Silver
Wyandottes in the brown egg class. They
laid well and paid well, even at the low
prices ruling for eggs over 30 years ago
in New York City.

Being a fancier and admirer of all purebred
live stock, I could not have a cock or hen
on the farm that would not measure up to a
high standard in both shape and color. Be-
lieving in the old adage, "Handsome is as
handsome does," I found ways and means of
making the Standardbred hens and pullets
shell out eggs that were of marketable size
and high grade quality. The breed, together
with careful selection of breeding stock and
eggs for hatching, with proper handling and
feeding were the factors that built up prolific
laying strains.

Some of the finest white shelled eggs pur-
chased came from a small White Leghorn
poultry yard kept by a woman who bred up
a strain of layers from an original stock noted
in New England years ago for its Standard
type and color, which, added to its vigor,
made it a sound foundation for the develop-
ment of an egg laying strain and at the same
time maintained its Standard requirements in
shape and color. The eggs laid by this flock
of Leghorns were sizable ones that would
not rattle in a 30 dozen egg crate as some of
the Leghorn eggs produced by present-day
utility Leghorns kept under modern high pres-
sure methods of production will do today.

To exhibit hens and pullets in so-called
production classes at poultry shows in early
fall, does not appear to be practicable, to say
the least. Condition is the most vital factor
in an exhibition specimen. As every expe-
rienced breeder and fancier knows, a pullet
is at her peak in form and color just before
she lays her first egg. Exhibiting the same
pullet when laying results in loss of form or
condition, which would lessen her chances in
the show room of winning a prize if the
class were judged by existing Standards.

To enter laying hens in old feather in such
production classes would be very similar to
exhibiting sows in breeding condition just
prior to or about the time of their having a
litter of pigs. What is more impracticable
is the shipping of such laying hens to a
poultry show. It cannot be done with safety
to the sow in breeding condition while with
the laying hen broken eggs and egg eating
may be the result.

The following question has been asked in
all seriousness by an earnest fancier and

breeder of Standardbred poultry, one who has been a close observer and keen student of conditions in the poultry industry: "What is to become of exhibitors who make a business of exhibiting at fall fairs, if a productive chapter in the Standard is to include a statement in substantiation of the claim that only late molters are heavy layers? If such a standard is issued every hen in new feather at every fall show will be put down by the judicial production-class examiner as a poor layer on the authority of the American Poultry Association. The ultimate result will be that only hens in old feather (with faded shanks) will receive the approval of the public, and the friends of fair boards," is the way our correspondent sizes up this "Production Class" folly or incubus—take your choice.

Utility is a most valuable and practical asset of the Standard hen—in the laying pen or breeding yard. To transplant it, hen, bag and baggage, to the show room can only result in making the exhibiting and judging of poultry a farce in this country. It would change and riddle the Standard to a frazzle. Two conflicting Standards would do the work that can only be safely and authoritatively done by one Standard. As Editor Frank L. Platt in a recent letter remarked:

"The Standard ought to be as hard to change as the Constitution of the United States. It must not be whipped around by every passing breeze."

Editor Platt, in July American Poultry Journal, has clearly pointed out the possible dangers resulting from the "breeding in" of "Production Classes" into a book that is consecrated to the advancement of the Standard-bred fowl, a Standard of authority to protect the birthright and breed type of every race of fowl recognized by the American Poultry Association. Such a Standard ought to be hard to change, as Mr. Platt states, and the representative organization of breeders of Standard varieties of poultry in the United States and Canada, the American Poultry Association has not the power to depart from its fundamental principles to change the Standard without the consent of the majority of its members. That consent will never be given, as long as poultry shows exist and exhibiting and judging is done "according to Hoyle" or in other words, done with due regard for the Standard as a fixed and inflexible guide for exhibitor and judge.

Neither will managers of our successful poultry exhibitions consent to allow such production classes in the competitive Standard varieties. Neither will any accredited A. P. A. poultry judge—licensed or unlicensed—consent to pass upon classes demanding dual standards.

That utility deserves recognition by every breeder of Standardbred poultry cannot be disputed.

And utility or production classes will find their proper sphere at agricultural experiment stations and at laying contests, where their qualities of meat and egg producers will undergo practical tests and the hens will be judged by the "fruits of their labor" instead of by more or less unstable, theoretical standards for judging production.

That, as far as I know, is the opinion of experienced and conservative breeders and fanciers of Standardbred poultry, men who have the best interests of the American Poultry Association at heart, and who fully realize the importance of utility as an invaluable asset to many of our dual purpose varieties bred and recognized by the Standard.

That utility can be made to reach high profitable limits in the Standardbred hen without appreciable loss in breed type is a well-established fact. That ultra-utilitarian propagandists and utility poultry breeders have not always kept this fact in mind is not to be denied. That is the crux of the whole situation.

Standard for Growth.

At this season of the year everyone is anxious to know whether his chickens are making the proper growth. It is extremely difficult to determine by merely looking at a flock whether they are as large as they should be for their age or for the time of year. The only accurate method of knowing whether ones birds are making the proper gain is to weigh them at different intervals, then their weights at any age may be compared with a table of normal or standard weights. The following table shows the age at which Leghorns should attain the weights indicated, according to the Connecticut Agricultural College:

Chickens	1 pound	8 weeks
Pullets, only	2 pounds	14 weeks
Pullets, only	2½ pounds	17 weeks
Pullets, only	3 pounds	21 weeks

DR. HESS INSTANT LOUSE KILLER

Sift Dr. Hess Instant Louse Killer on the fowls, into the nests, on roosts, about pens, coops and yards. Be sure to keep it in the dust bath all the year 'round. Fowls will work it into the feathers. That means louse prevention. It comes in handy, sifting-top cans—very convenient to use.

For lousy horses, cattle, colts and calves, stroke the hair the wrong way and sift in the Louse Killer. Sold on a money-back guarantee.

Rapid Development of Young Stock.

By Henry Turck.

In the October issue of American Poultry Journal, last year, there was a little comment on a Black Java cockerel that I had raised. This bird at 10 weeks of age weighed $3\frac{1}{2}$ lbs. and two of his sisters 2 lbs. 15 oz. and 3 lbs. each. Unfortunately the cockerel had red eyes and yellow legs, precluding the use of him as a breeder, for Javas to suit me must have coal black eyes, shanks with bottoms of feet deep orange yellow.

After trying in vain to sell this cockerel to some of the Black Jersey Giant breeders in the East. I sent him to a sister living in Indiana who has a nice flock of Rhode Island Reds; by no means of exhibition class, but still above the average utility kind.

Some time ago she wrote me that from a setting of eggs she raised eight black beauties, with not a trace of red in their plumage and all with deep red eyes and yellow legs.

This showed the prepotency of the Black Java male and will give me foundation stock to raise Rhode Island Blacks. I should add that if Black Giant breeders would accept yellow shanks they would not infringe to such a great extent on the true Black Java.

In Frank Platt's book on American Breeds reference is made to some of the reasons why a Black fowl was preferred for a city bird where the smoke and grime would discolor a white or light colored bird; also the fact that

pinfeathers on a black plumaged fowl were so plainly visible that it was a guarantee the pinfeathers would not be eaten, for they were more easily seen and removed than the pinfeathers of a white, red, buff or mixed colored bird.

At the last Coliseum show a breeder of Rhode Island Reds made a remark to me about the black pinfeathers of Javas showing up too prominently on the deep yellow skin of the fowl when dressed for table use. I offered to bet him \$25 that if he dressed one of his Reds and I one of my Javas that the Java carcass would present a better appearance than his Red the decision to be left to any disinterested party and whoever lost the argument was to pay \$10 for the bird killed and have both carcasses for his own use. But the man with the "red to burn" strain backed out.

Javas are quick growers, mature early and lay all through the coldest weather, in consequence of which some 35 years ago I adopted the slogan, "King of Winter Layers."

There's a reason as to the "whyness" of Javas being such excellent winter layers and this reason applies with equal force to all black fowls. A black fowl, being in the open where sunshine hits it part of the day, absorbs considerable heat, by reason of its black color, from the rays of the sun. Black absorbs heat, also radiates heat. A black asphalt street is made white so that it will not absorb so much heat as to become soft. A black plumaged fowl likewise keeps warmer during the winter and not requiring all the fuel of the feed to maintain the animal heat neces-

sary for life, it is enabled to convert more feed into eggs.

In Dixie land for many years I raised White Leghorns for market purposes as there is no better eating broiler than a White Leghorn cockerel weighing from 1 lb. to $1\frac{3}{4}$ lbs. Fed in the right way they will attain a weight of $1\frac{1}{2}$ lbs. quicker than any other variety of chicken. But, when a Leghorn goes beyond $1\frac{3}{4}$ lbs. he loses his value as a broiler because he then becomes an aeroplane chicken—all machinery and wings with no flesh on him.

Leghorn breeders who boast of the large number of eggs laid by some strains overlook the fact that it is not the number of eggs a hen lays in a year's time but the season when she lays that matters. In spring and early summer even a feather duster might lay eggs. But in actual cash receipts for eggs give me Black Java in preference to any living variety of fowls because they will lay eggs in winter when eggs fetch close to the dollar mark per dozen, instead of spring prices when the egg factories are working time and a half.

I am getting away from a comparison I want to make with my $3\frac{1}{2}$ lb. cockerel raised last year.

This year I have grown a few chickens on my little city back lot that promise to eclipse last year's performance. Some April hatched pullets attained a weight of 2 lbs. and over on June 1.

How did I do it? Well in the first place I never give my baby chickens any grit of any kind as I do not consider grit at all necessary. It is not a food

CHICKS by THOUSANDS FROM THE NEW IDEAL MAMMOTH

This latest Mammoth, hatching from 1360 to 27,200 eggs, represents the highest development in artificial incubation. Designed by men who have made a lifetime study of incubation, built for permanency of select Red Oak and California Redwood, with an approved heating equipment controlled by a specially designed vapor thermostat—no unreliable float valve—with a simple turner that turns every egg in an instant and does away with the antiquated, space-consuming rollers, an automatic, electric signalling device that guards the temperature of the egg chamber, this 1922 Ideal embodies.

All the Latest Improvements in Artificial Incubation

Heated by either a Special Blue-Flame Kerosene Stove, or a Specially-Designed Coal Burner. Capacity of incubator can be increased by adding one or more sections or by double-decking. Guaranteed to hatch a Big, Vigorous Chick from every Hatchable Egg.

Send name for Free Hatching Guide and get posted on how to start a profitable day-old-chick business. We also manufacture 660-egg and 1320-egg Community Hatchers heated by the same Blue-Flame Oil Stove as the Mammoth. Write TODAY for Free Hatching Guide to

but is the cause of so-called bowel trouble by causing an irritation of the tender intestines. I feed bread soaked in milk squeezed almost dry for the first day or two and then give them dry mash and chick feed (gritless) containing a large part of pinhead oatmeal or hulled "oats."

The two greatest known oat eaters—Scotchmen and horses are strong boned, heavy framed animals! Now I go the sprouted oats cranks one better. I soak the oats intended for sprouting purposes in sweet skimmed milk and use milk in wetting the oats down until they are big enough to feed.

By so doing I put the animal matter right into the feed in such a manner as to assure each bird its share of the animal protein which cannot be secured in any other manner as successfully.

Feeding beef or meat scraps in the mash is all right in its way, but unless the mash blends well the stronger chicks will get all the pie while the weaklings will have to take the leavings.

Some 10 years ago William Osborn, Goos: Lake Farms, Illinois, had me visit his place and show him that my practice was correct. He afterward said my no grit system had saved him dollars and chicks.

After a week's feeding on bread, milk and chick feed I begin feeding boiled beef shredded fine as possible through a meat chopper. And I never let them go a day after that without some meat. It must be boiled, however, as when raw meat is fed there is always danger of tainted meat and intestinal worms. Of course there is also danger in feeding too much meat, causing looseness of the bowels, but anyone to become a dyed-in-the-wool poultryman must be a close observer and watch the cause and effect. Droppings will indicate by color and smell if you are feeding too much.

Parties have remarked to me, "You put in too much time babying your chicks, no wonder you can raise them so fine and fast." Now if you don't like to baby or "fool" with your chicks you are not a real fancier!

Looking back, way back, I recall my

first exhibit of Black Javas at Cincinnati, Ohio, Music Hall Show, about 1883.

Before taking up Javas I bred White Faced Black Spanish but found the large combs and wattles were too easily frosted to suit me; so I got some Java eggs from an acquaintance. From these I had a fairly good hatch and showed one pair of birds which I named "Romeo" and "Juliet." I had made regular pets of the chicks and babied them all I could. Juliet grew to be a remarkably large bird and at the show the late Beriah N. Pierce—the "boys" all knew him as "B.N."—disqualified Juliet. She weighed $8\frac{1}{2}$ lbs. He marked her score card "Improper entry—should be entered as a hen," but later on when I produced sufficient evidence as to her age, he scored her again, cutting awfully for overweight as prescribed in the then Standard of Excellence. Result, Juliet was placed second; the first prize pullet looking like a bantam by comparison.

Next year I showed 20 Black Javas with an average score of 95.95, winning great admiration and honors at the show. I was then made president of the Ohio Valley Fanciers' Association which held a real fanciers' show in Music Hall, Cincinnati.

I recall exhibits of T. F. McGrew, I think he showed White Cochins then, Sid Conger of Flat Rock, Ind., Dan Christian of Roanoke, Ind., and Frank Marshall, originator of Black Wyandottes, were exhibitors. Conger and Christian were leaders in Barred Rocks. In those days Javas were more popular than now and I had some hot competition.

About this time I got several white sports from my Black Javas and bred them for several years with results as stated in Platt's new book, "American Breeds of Poultry."

Incubators were then coming into favor and the Prairie State machines, in operation and hatching well at the show, attracted a good deal of attention and comment.

I then made up my mind that at the next show I would be there with natural incubators and brooders. I hatched 13 black chicks under a White Java hen and an equal number of White chicks with a black mother.

I had a large sign painted: "Mother Eve—Pioneer Incubator and Brooder. First and best on earth. Patent not applied for."

This feature was quite a novelty and drew crowds around the coops at all hours.

Old files of the American Poultry Journal show where I won at all the leading shows and international fairs, such as Detroit, Buffalo, etc. At Buffalo, J. Y. Bicknell scored one of my pullets 98 points; later she was sold to an Eastern fancier who won a gold medal on her at Boston. She was, I believe, the highest scoring bird in the American class there.

All my life I have enjoyed breeding and showing good birds. As an old man I may have some rather set notions, but I really believe that you must follow certain laws of nature and be a "chicken crank" enough to spend many hours, if not days, of close observation.

Just simply putting together a male with six, eight or a dozen females does not constitute a mating.

When a female submits to the service of a male only after being chased all over the lot and finally run down don't expect her to be mated in the same sense as is the female that courts the attention of the cock.

It took me quite a few years before I was able to perpetuate into my Royal Strain of Javas such features as coal black eyes and legs, and small rigid combs, nicely and evenly serrated, as most of my males had regular beef-steak combs, as large as one's hand and with a tendency to "lop"

Now after all these long years I've got back to my old love on a small city back lot; but, believe me, boys, I strive for quality, not quantity. If I had had in 1883 five such high class birds as I now own, Javas would not have gone

GREEN SHEEN STRAIN

Silver Campines

Elegant young stock, well grown, now ready for sale at fair prices. A wonderful selection of cockerels, pullets, cocks and hens at your command. I am especially prepared to furnish exhibition birds that will win for you and prove to be sound breeders. My birds are single mated and exhibition birds are mated together. No trick back of these birds.

Campines are fast growers, plump at all ages, heavy layers of large, white shelled eggs and eat less food than Leghorns.

I have the largest plant devoted to the raising of exhibition and high egg-record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 62 males placed under ribbons at the Coliseum Show in last nine years. During the same period, I have had 147 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

Write me for information. Your absolute satisfaction is guaranteed.

back. But they are coming to the front again as there are quite a few interested in the oldest American breed, one from which many of our new breeds have originated.

If in addition to Black Javas, I take up Rhode Island Blacks, I will know just exactly what I want, whereas in the old days those authoritative judges, Pierce, McClave, Bridge, Brown, Bicknell, Marshall and others each had ideas of their own and interpreted the Standard to suit their individual notions. There has been a world of progress since then. Breeders are more careful, judging is more uniform; but most surprising of all the A. P. A. is less interested in the fancier today than in the old times.

I have had some correspondence with a few of the old timers and if the American Poultry Association is going to be the tool of a lot of theoretical breeders who have actually never bred birds but bought them from someone who is what Platt calls a constructive breeder; if the A. P. A. is to listen to men who in reality have not grown enough birds to know what they are talking and writing about, I may yet live to see the day when men whose ideals are above the dollar get together and form a breeders' association or club and make a Standard of their own. I know several breeders who would join such a club.

A Black Java pullet hatched March 17, 1921, laid her first egg for me Aug. 17, 1921. Of course, I would rather she should not lay so early. I had hoped to exhibit her and, like other fanciers at this season of the year, I am put to my wit's end to hold back laying. A pullet that lays too early never attains sufficient size; she usually goes into a fall molt, but if she does not, and lays all fall and winter, she is not worth a fig for breeding in the spring. That bunch of reformers who proposed "production classes" in which to exhibit laying pullets at our poultry shows, are men who, in large part, never show birds. Shipping laying pullets to poultry exhibitions is the height of folly. A pullet is at her best just before laying, it is then that bloom comes into her plumage, and her comb and eyes are brightest, and her general set up most fascinating. It is hard to explain this fact to beginners, and the danger is that new men will be lead astray by reformers who make their living not out of chickens but out of chicken breeders.

I have never had much use for the A. P. A. because it did me a great injury when White Javas were practically killed, putting me out of business, but there was at that time a close coterie of judges who virtually "pulled my leg" for advertising, donations, etc., and who, when I called a halt on this system, did all they could to reject the White Javas from the Standard.

At one meeting of the A. P. A. at which I was a visitor, I remember the fight that one of the members made against the admission of "games"; a breed worthy of recognition.

Am sorry to hear that Dr. H. P. Clarke has quit breeding. He did a world of good in bringing out the Cornish.

The American Breeds of Poultry

By FRANK L. PLATT

This new book, published 1921. Up-to-date in all particulars. 256 pages. 100 illustrations. Printed on enameled paper. Bound in brown cloth. The most elaborate and costly book we have ever published.

This is the only exclusive work ever offered to the public on the great dual-purpose breeds that have been made in America by the genius of American breeders. An entirely new text, in which the author goes back to original sources, and starting at the beginning writes a history of the American breeds, tells of their origin and traces each step in their development. Every detail on the proper mating of each variety is given in a plain, practical way.

M. L. Chapman, manager of the great Wilbartha Poultry Farm, writes: "I think this book is away ahead of any similar work I ever read and intensely interesting. If I could have had some such similar book twenty-five years ago, I would have been winning at the Madison Square Garden Show a great many years earlier."

All you want to know about Barred Plymouth Rocks, White Plymouth Rocks, Buff Plymouth Rocks, Partridge Plymouth Rocks, Silver Penciled Plymouth Rocks, Columbian Plymouth Rocks, Blue Plymouth Rocks, Black Javas, Mottled Javas, Black Giants, Buckeyes, Missouri Fluffs, Silver Wyandottes, Golden Wyandottes, White Wyandottes, Buff Wyandottes, Black Wyandottes, Partridge Wyandottes, Silver Penciled Wyandottes, Columbian Wyandottes, S. C. Rhode Island Reds, R. C. Rhode Island Reds, Rhode Island Whites, Dominiques. Full details on breeding for meat and eggs as well as all Standard points.

Only a few of the general subjects are:

Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualifications of a breeder; Work of the breeder; Building a strain; Inbreeding; Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting.

No matter what breed of chicks you raise, whether English, Mediterranean, or American, you will learn much to your advantage.

The Beautiful Silver Penciled

(Continued from page 819.)

one whose beauty is of such fine contrasts in black and white that its admirers have been numerous, although its breeders have been few.

The variety was originated by Ezra Cornell, namesake of Ezra Cornell, who founded Cornell University on the hills, at the foot of the beautiful inland Cayuga Lake, and who then built the Lehigh Railroad from New York City to Buffalo in order to provide direct transportation to Ithaca, N. Y., and the institution which perpetuates his name.

The first matings were made in 1894 by Ezra Cornell, nephew (it we recall correctly) of the founder of Cornell University, Ithaca, N. Y., and he was helped in his work by George H. Brackenbury, who lived near Auburn, N. Y. Both of these men were keen students and accomplished breeders, which accounts for the rapid progress made in blending Silver Laced Wyandottes, Dark Brahmas and Silver Penciled Hamburgs into a new and dependable variety of the Wyandotte breed. Partridge or Golden Penciled Wyandotte blood has since been introduced into the Silver Penciled variety with excellent results. It strengthens the black markings and the red color is easily bred out. The early results of the cross may, however, be detected by buff colored feathers on the face or the top of the head of the Silver pullets.

Mating Silver Penciled Wyandottes.

Ezra Cornell desired to produce the pure white and pure black of the Silver Penciled Hamburg. This is the goal to aim for. But a penciling so clean, so distinct on the female, leads to a weakness in the black colored sections of the male. The simpler way, therefore, to produce what is most desired is by the double mating system.

There is a tendency for the sound-colored exhibition males to contribute too much color to their female progeny; but such dark, heavily penciled hens make good cockerel breeders. They often are stippled with black as well as penciled; their hackles are striped with black; and their wing primaries are black edged slightly with white on the lower edges. Such hens, if bred from a high-class exhibition male, will produce in their cockerels solid black throats, breasts and bodies, solid black wing coverts which form the wing bar, and solid black tails, heavily hung about with rich black tail coverts free from white splashing; and solid black striping in neck and back, free from white quills or "shafting." The pullets from such a mating will be strictly "cockerel-bird," lacking the distinct penciling desired in exhibition pullets and having tails that are black to the roots of the feathers. They should also have wing primaries that are solid black except for a slight edging of white on the narrow side of the primary feathers.

The beautiful combination of clean steel-gray, penciled with distinct bands of soft black, which is the real beauty of a Silver Penciled Wyandotte pullet at her best, can be most easily reproduced by mating a well penciled female to a male whose dam was a high-class exhibition female. It will be found that this male carries striping in hackle and saddle, but the stripe may have a white quill in it, and the entire top plumage presents a silvery white appearance. The breast and fluff of this male will carry some white and the tail coverts may show some white. The throat, however, should be reasonably black, for weak throats in pullets are a common fault. The undercolor of such a bird will be light, and if he carries some white at the base of tail, it should not be deemed objectionable. His wing primaries should be correctly colored. Yellow shanks and beak will come naturally to such a bird. Now, if his ancestry on the female side is right, you can produce some wonderful pullets when such a male is mated to high-class exhibition females. The pullets will be of the desired steel-gray color, cleanly and distinctly penciled. They may in their early plumage appear weak in penciling on throat and upper breast, and if the show is an early one, these light colored feathers may be plucked and the mature penciled throat and breast plumage will then grow in.

Conditioning Birds for the Poultry Show.

(Continued from page 818.)

in attendance; when you are ready to ship, provide a roomy shipping coop for each bird; this is important. Take a cloth and brush out the inside of every shipping coop before putting birds in. Also see that no tacks or nail points show inside the coop because if they do a bird will easily tear his comb and arrive at show room with a mass of blood soaked feathers. Upon arriving at the show, wipe out every cage before putting your birds up. Have a lock on every cage when you are not present, as inexperienced people sometimes bother and hurt the birds by taking them out of the coop. See that your birds do not eat and drink too much, as birds that have been in transit are generally very hungry, and as the feed cups usually contain twice as much as a bird should have at one meal, they are liable to gorge themselves and then be "dopey" for the rest of the week. Be on hand

early the morning the birds are to be judged and see if all your charges are looking their best. A little cleaning up at this eleventh hour will sometimes save a ribbon for you.

It is a good plan to take a large string, as you are much more apt to hit the judge's eye, and it gives you a better chance at the sweepstakes and specials. It also makes a better impression on the buying public, and gives you more birds to sell at the show if you are in the market to sell. Birds usually bring their best prices in the show room where the enthusiasm runs high.

You will probably think this a lot of trouble, but some one has said: "He who stops to count the cost of success, never succeeds." Any one who can breed, grow and prepare a string of birds of any prominent variety that will win out at New York, Boston or Chicago has the foundation for profitable business established right then and there. Thorough preparation often enables a man in moderate circumstances to break even with a man who has lots of money to buy show birds but who

trusts the preparation of the birds to an employe. This may also give you the reason why breeders ask so large a sum for a bird that is ready and in shape to win. Hard work and intelligent attention to details are the key-notes of success in the Standardbred poultry business as in everything else.

Rose Comb Anconas.

The Rose Comb Ancona is a Mediterranean breed of fowl and gets its name from the town of Ancona, which is on the east coast of Italy. From Italy they were imported into England and then brought from that country to the United States. A few years later they were admitted into the American Standard of Perfection.

At that time the single comb variety was more numerous and popular but now the rose combs are forging ahead by leaps and bounds, probably because of the fact that they are such good layers, so very neat and trim and their combs do not freeze so easily in the winter time as do those of the Single Comb variety. Rose Comb Anconas are distinctively an egg breed. Their eggs are generally large and white, although some times they will lay an egg of tinted color.

Rose Comb Anconas are very hardy and vigorous, thrive and do well in most any climate. The little chicks grow and develop

Educated as well as Pedigreed Poultry on the range of the Pennsylvania Poultry Farm, Lancaster, Pa.

faster than other breeds and pullets begin to lay at 5 and 6 months old, sometimes earlier. Hens are profitable layers when 3 and 4 years old and the hens lay larger eggs than the pullets.

The cockerels make good broilers and they grow so rapidly and mature so early, that they can be put on the market sooner than those of other breeds. They make fine eating as they are plump, have a nice skin and their flesh has a very fine flavor, so that while Anconas are especially an egg breed, they are also a good table fowl. Being of medium size, they are first the thing for private use. Standard weight for Anconas are: pullets, $3\frac{1}{2}$ lbs.; hens, $4\frac{1}{2}$ lbs.; cockerels, $4\frac{1}{2}$ lbs., and cocks $5\frac{1}{2}$ lbs.

Look at the pictures of Anconas that appear from time to time in American Poultry Journal and you will readily see that they are a very handsome and neat fowl.

Ancona chicks when hatched are canary color with black backs. As they grow older the mottling begins to appear and they are soon in full feather and present a very striking and beautiful appearance. When they are full grown the feathers are black and about one feather in every five (sometimes more) is mottled at the end with a small v-shaped white tip which surely gives them a very pretty mottled appearance, like snow flakes that have fallen on a piece of black velvet.

The black feathers have a green tinge, or sheen, as it is called, and this is especially more noticeable in the male birds. Legs are yellow or yellow mottled with black. Ear lobes are white or sometimes cream color.

Rose Comb Anconas are very lively, alert and active and have a proud carriage and are a delight to the eye of the fancier. They generally present a clean, well groomed appearance and this makes them very desirable for those who live in towns or cities, as they do not show the dirt, like some other fowls.

An Ancona pullet holds the record of laying 331 eggs in 365 consecutive days, which is certainly an achievement worth while and not to be sniffed at. How many hens of any other breeds have anything like that to their credit? At the Missouri State experiment station at Mountain Grove in an egg laying contest of twenty leading breeds

of poultry, it was found that the Anconas produced 300 eggs from 100 lbs. of feed, which was 32 more eggs than the nearest competitor. Besides this the Ancona eggs weighed more per dozen than those of any other breed and the Anconas laid the largest percent of eggs during the winter months, when eggs are highest in price.

This shows them to be the profitable breed to keep and also plainly proves the claim that has been made by Ancona breeders, that Anconas produce eggs at the least cost per dozen of any breed. A pen of Anconas also won the egg laying contest at Victoria, B. C., which puts them in a high and creditable position as the egg producers of today.

Anconas attract a lot of attention in the show room, and in some of the largest shows they are one of the leading and largest classes. Just walk down the aisles of any large show room and strike the "Ancona alley," and see, lingering near the coops, the lively and enthusiastic bunch of breeders and fanciers who are interested in this great breed. How can you get a start in breeding this grand breed, the rose comb Ancona, you may ask. I will tell you. While there are different ways of getting started such as buying stock or hatching eggs, one of the best ways to start is to buy good stock. You can send and get a good pair, trio or pen of fowls, and then hatch the eggs you get from them and raise your own chicks and thus get a nice start.

If you cannot do this on account of not having room or because you do not want to buy stock at this time, then buy some good hatching eggs. This is a good and economical way to begin.

With an investment of a few dollars in setting eggs you can hatch well bred chicks and if you get a good hatch and then take good care of the little chicks after they are hatched, you will have a nice start.

Each year select out the best ones and keep them and do this every year and you will soon have a nice flock of these beauties. One or two good chicks hatched and raised from a good setting of eggs, would be worth as much or more than the price you paid for the whole setting of eggs. No matter where you live you need not hesitate to place your order with a good breeder who lives a long distance from you because in these days

breeders can get the best kinds of packages in which to ship settings of eggs, and if they are carefully packed and cared for, they should reach you in good condition, no matter where you live.

With all of these good qualities to recommend them, it is no wonder that the Rose Comb Ancona has become so popular and that the number of breeders is increasing and the demand for stock and eggs is very great. Anyone who wants to get a start in this breed this season, had better get busy and place their order. Now is the time to take up this most excellent breed and those who are wise will do so, if they have not already, for this breed is a winner.

I will say as a last word to you that those in search of a handsome and useful fowl, would do well to take up the Rose Comb Anconas. G. W. Simms.

New York.

A Paint for Poultry Houses.

I wonder if any of your readers have had any experience with using cement paint on their poultry buildings, and if so, will they give their fellow poultrymen the benefit of this experience through your columns.

Several years ago the writer read in some publication an article about some one who used a paint made of powdered cement and sour milk. Several days ago he experimented with this and to all appearances it is a success.

The paint was applied to the unpainted and weather beaten boards of an old dog house. It seems to adhere firmly, and will not rub or wash off. It covers the surface completely and fills all pores. The question is, how long will it last? Will frost and cold weather affect it?

I mixed thoroughly the cement with the sour milk to the consistency of paint and applied it immediately. It must be stirred very frequently, as naturally the cement will not stay in suspension as paint will in oil. I tried one side of the house with about 30 per cent of hydrated lime mixed with the cement. It gave a much more pleasing and lighter color than the pure cement mixture. To all appearances it was just as good.

Ill. A. D. Fashett.

CANDEE—Your First Big Step Toward Success

The CANDEE Incubator with its exclusive patented, double automatic heat control and correct ventilating system gives double protection against chilling and overheating and is the closest imitation of setting hen conditions that has been perfected.

An automatic regulator at the coal burning heater maintains the correct temperature in the hot water supply pipes. And each egg compartment has its own automatic regulator that controls the amount of hot water admitted into that compartment. Thus each compartment's temperature is certain to be correct throughout the entire hatching period. Hatches can be started in any compartment at any time without interfering with others.

CANDEE hatches, consequently, are most satisfactory and assure sturdy, vigorous chicks full of vitality. Such chicks grow rapidly and develop into healthy birds that make profitable layers.

Our Big FREE Catalog Gives All the Facts. Send for it TODAY

Our elaborate catalog explains the superior features of CANDEE incubators and contains pictures of many poultry plants in every section of the country. Send for your copy today.

Breeds of Geese.

By Chas. T. Cornman.

Considerable interest is being shown in the breeding of geese, and it is our desire to do what we can to influence the breeding of more geese and better geese. We find comparatively few Standardbred birds and we are being constantly asked for goose information. Six breeds of geese have been admitted to the American Standard of Perfection, namely: Toulouse, Embden, Chinese, African, Wild or Canadian, and Egyptian.

In addition to the Standard breeds there is the so-called mongrel goose, which is a hybrid made by crossing one of these varieties or the common goose with wild geese. Crosses of the varieties of geese, especially of the Toulouse and the Embden, are occasionally made, but without any apparent gain. The Toulouse, Embden, Chinese, and African are easily the most popular breeds of geese in this country, the first two greatly leading the other breeds. All economic breeds of geese are kept primarily for the production of flesh and feathers, and although their eggs are occasionally used for culinary purposes on the farm there is no demand for them for food purposes in the markets.

The Toulouse, the largest of the Standard breeds of geese, is a good layer, producing from 20 to 35 eggs a year, is docile, grows rapidly, and makes a good market bird. However, its dark pinfeathers make it a slightly less attractive market goose than the Embden.

The Embden, a large white goose, slightly smaller and with somewhat longer legs than the Toulouse, is only a fair layer, and is usually less prolific than the Toulouse. This breed has white pinfeathers, is a rapid grower, and matures early.

There are two Standard varieties of Chinese geese, the brown and the white. Both varieties mature early and are said to be prolific layers and rapid growers, but shy and rather difficult to handle.

The wild goose is bred to some extent in captivity, and the young are sold to hunters to use as decoys. The wild gander is used to cross with either the common or the purebred goose, producing the so-called mongrel goose. This mongrel goose is highly prized as a market goose, but is sterile and cannot be bred.

The Egyptian goose is a small, brightly colored goose kept for ornamental purposes and rarely seen in this country. It resembles the wild goose in shape and weighs 2 pounds less in each class.

Head Lice.

I have been reading articles for years on the Summer care of fowls and chicks. Some are good but in many cases the writers advise the use of lard or other grease to rid small chicks of head lice. This is downright cruelty at any season especially in the cool months of April and May or when chicks cannot get under the hens. Did you ever try it? As a result of this barbaric treatment the down on the chicks is separated by the grease and the skins of the chicks are visible from head to rump. This makes them cold at all times; worse yet, they accumulate all the dust and dirt the grease will hold which adds more misery. This delightful condition will continue a week or two and in this time the grease will have done more harm to the chicks than the lice could have done.

To get rid of lice give the chicks a roll in a small pan of good insect powder or touch the infected spots with the end of the finger after dipping it into headlight oil, then by morning the oil will have done its work on the lice and evaporated, leaving the chicks in good condition and comfortable.

There is nothing that requires more horse sense and attention than is needed in handling chicks. The man who wants to use lard to kill lice has outlived his usefulness.

W. N. WATSON.

Market Your Eggs in Neat, Compact and Safe Self-Locking Egg Cartons

A big help in getting highest prices for your good eggs. Note—how large—how good—the eggs appear.

Suitable for supplying your local customers or for freight, express or parcel post shipment.

Try a sample lot. Send \$1.25 (postage extra) for 100 stock printed cartons labeled "Extra Selected Eggs" or "Quality Breakfast Eggs." Shipping weight per 100 cartons, 14 lbs. If you do not find the cartons the best you have ever used, we will return your money.

Write for prices on quantities of 1,000 or more with your farm name or brand name.

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

The Beginner With Poultry.

First Prize Article.

Did you begin to raise poultry at a time when you knew absolutely nothing about it? Well, I did. It was a little over two years ago, and I regret to say that in all my search, and all my reading, I failed to find a book or an article that told me all that I needed to know.

Beginning with housing, I found large numbers of coops that perhaps would be well suited to farm poultry raising, but few that suited my back lot, or my idea of what I wanted there. It was not until I had my coop completed that I sent for a catalog of ready-built coops. In that catalog I found more good coop ideas for the back lot poultry man than I had ever seen before. I would have given a great deal had I received that catalog before I built, not that I might have purchased a ready-built coop, but because it would have given me far better ideas of the sort of building I should build. The result is I have been making changes in my back yard house ever since I erected it, and I do not feel that I am through yet.

When it came to feeding, just as in the case of housing, I knew not the first essential. I had everything to learn. I talked to everyone I met who knew anything of poultry, and read all I could find. From Government bulletins and various books it did not seem essential to do any cooking of feed for the birds I hoped to own, yet from some other books it seemed as though the authors would have you get up nights to prepare a warm breakfast for your flock. From the same sources it appeared that I was going to have to mix a lot of different kinds of feeds I knew nothing about. The recommended mashes and scratch feeds were as numerous and bewildering as a volume of court decisions.

Finally, a feed manufacturers' leaflet came to hand, and light appeared. I found I could buy ready mixed feeds that would serve my purpose. In poultry books and government bulletins, in their effort not to boost some particular brand of feeds, the authors lost sight of the fact that a large number of their readers would be beginners, who, like myself, had always lived in a city and knew not the first thing about poultry or feeds. Had they printed in bold type: "Mr. Beginner, you can buy ready prepared scratch and mash feeds, the products of different millers, at any feed store, which may cost you a little more than the feeds we recommend on the following pages, but which will serve you well," they would have removed nine-tenths of the discouragement I encountered. Not booting a particular brand of feed, but giving several recommended home mixtures is truly laudable, but it is little short of bewildering to the beginner who intends to keep only a few hens to supply the family table.

Equally bewildering is "the riddle of the breeds." On this subject no elaboration is required. We all have had

the fever to change from the breed we started with, but in my case I found I had started right.

From my various readings I was impressed with the thought that keeping an egg record, as well as a set of books (simple to be sure), of income and expense, would, at least, be interesting. So from the day I bought the first lumber for my coop I have kept account of my expenses, and from the day I received my first hens I have kept an egg record. For the eggs and poultry used on our own table I charge current retail prices. I charge myself with interest and depreciation on the money invested. This little trouble of keeping an account has repaid me for the information is both interesting and valuable. It has shown conclusively that the money and labor has given far greater returns than my garden ever did, and it has convinced me that the breed with which I started, which was the Rhode Island Red, serves my purpose better than the Leghorns which I raised from chicks a year ago. It has showed me that I had good birds from the first, that their average production was nothing to be ashamed of; with the result that this year I purchased a good cockerel and raised my chicks from five of the first ten hens I purchased.

The Leghorns have been good producers, but are too nervous to suit my conditions, and when killed do not furnish the nice carcass the Reds do. Moreover, the Reds are practically as good producers; my records show that. Between what was recorded in egg yield and what was not in larger carcasses and more quiet temperament, I reached a decision as to the most suitable breed.

My records showed me I was not wasting my time and money. I was not feeding a flock of slackers, and, judging by the returns, my methods must have been pretty good. Counting my labor nothing for it was so little it was really more of a pleasure—only three months out of the twenty-four have failed to show a profit.

I sincerely hope I shall never be so situated that I cannot keep at least a backyard flock. It has proved to be both a pleasure and a profitable use of my spare time. Never until I had my own hens did I enjoy eating eggs. Now I could not be without them.

Iowa.

H. Y. Carpenter.

Winter Eggs.

Second Prize Article.

There are many things about poultry keeping that I do not know, but I have learned some things from poultry magazines and some things from experience. When I first purchased a few fine Orpington hens and turned them out in the back yard, I thought the egg problem was solved—all I would have to do would be to throw a little corn to them two or three times a day and go out in the evening and gather in the eggs. Why was this not good reason-

ing? Had I not bought the finest and best bred specimens in the yards of an old experienced fancier? Why, those hens all had nice metal bands on their legs, and their eyes and combs and feathers answered just about perfectly to what a nice big book called for—a book full of fine pictures a fancier friend called the "Standard." And besides all this, every hen had been in a show room and had won a prize, and I had the score cards to prove it.

But hens were made to lay eggs, and why were my pets not laying? Surely they had all that heart could wish for. Corn? Yes, all they could eat, and my, how fat they got! Day after day passed by and day after day the hens ate corn, but no eggs.

Finally spring came, and with it the grass and bugs, and, oh, glory of glories! one fine day a hen layed a real honest-to-goodness egg. That was a starter, and it started me to thinking, and by the time the summer was over I had it all thought out—*hens must have the proper feed or they cannot lay eggs.* How simple! I was learning. I had been as ignorant as the young college fellow who decided he would go into the poultry business. He purchased a fine hen and a brood of Standardbred chicks and turned them out in the barn lot. The next day one chick died. The following day two gave up the ghost. The third day several chicks staggered around a while and turned up their toes. Soon all were gone. In a rage the young would-be poultryman went to the original owner and demanded a reckoning. "What did you feed them?" the man of experience queried. "Feed them?" cried the berieved man, "Why, I thought they sucked."

I read somewhere that an egg is composed of 65.7 per cent water, 11.4 per cent protein, 12.2 per cent ash, and 8.9 per cent fat. I learned that this combination is the same everywhere and with all hens.

Biddy cannot change the composition of an egg, neither can she manufacture something out of nothing. Therefore, by what little logic I had heard the professor expound, I concluded that if my hens layed eggs in the winter they must have something from which to manufacture them. Corn and other common grains abound in fats but do not supply the protein. The hens must have protein in even larger quantities than fats. By studying my hens I learned that if given a chance they would help themselves to what nature demands, but in the winter time I must make this provision myself or go without eggs.

What is a good winter feed? In the first place, the hen must have grain. Feed whole grain always in deep litter, for the layer must be kept exercising. Feed equal parts of wheat and oats in the morning and feed whole corn at night. In the second place, keep a good dry mash before the hens at all times. Any good commercial mash will do, but if you prefer to make it yourself, mix thoroughly 25 pounds of bran, 20 pounds of middlings, 20 pounds of corn meal, 20 pounds of alfalfa meal, 20 pounds of ground oats, and 20 pounds of meat scrap. Add a little salt, about $\frac{1}{2}$ lb. to 100 lbs. of mash. Feed mash in hopper and keep it before the fowls all the time.

Besides grain and mash, green feed of some kind is necessary for good

UNCLE SAM

Milk Albumen

**Did You Read
What Experts Advised
About Milk Last Month?**

One Poultry Expert in writing about the care of Chicks said: "Early in my life, I accidentally discovered the greatest food in the world for chickens. Later on I experimented to find some other ration that would produce as good results, but I have eventually come to the conclusion that nothing will take the place of milk in some form for growing chickens."

The cheapest and most convenient form of pure milk for feeding poultry is
UNCLE SAM MILK ALBUMEN

It is rich in protein, builds muscles, blood supply and hastens molt and maturity. Chicks relish it more than feeds containing meat scraps. It is pure. Now is the time to try it.

GIVE IT A TEST: You can ask your dealer for it, get a mixed feed containing it—or let us send you enough **UNCLE SAM ALBUMEN** to feed 25 hens 30 days. This generous sample with pamphlet about **UNCLE SAM MILK ALBUMEN** we will send postpaid for \$1.00. Send today for your test sample.

Write Good Ads—Make Sales—Increase Profits

Graves Home Study Reading Course in Poultry Advertising and Sales Will Teach You How

Don't follow the crowd—be a leader. It's up to you whether you succeed or fail—don't let this chance pass by. I will point out to you the road to opportunity and success. Fan the spark of personal power through knowledge—an unquenchable desire—which burns away all barriers to success. Fan it in the undimable light of enthusiasm. For all accomplishment waits upon enthusiasm.

Every poultryman who would succeed must have this information on Advertising and Sales. He must either acquire it through long tedious years of costly experience or by the short cut offered you here. Read on—you risk nothing if not satisfied.

I WILL HELP YOU!

In my new Complete Home Study Reading Course in Poultry Advertising and Sales including the famous Graves Ad-Chart System, I have gathered together the best advertising knowledge for the poultryman after seventeen years of study and experience and poultry breeding. It is the same kind of knowledge that has taken the big breeders years of experience and many costly mistakes to find out—it is now offered to you at the price of an ordinary pullet.

I want to make my life-work WORK FOR YOU!

The ideas and knowledge of how to write advertisements and make sales are ripe with golden dividends for you if you will put them into practice in YOUR WORK.

Every Forward Looking Poultryman

Every Breeder, be he beginner, student, or with years of experience, should own this work. You be the Judge; examine the complete course without risking a penny. This Course tells you how to build your poultry business—how to advertise and make sales—how to write classified ads that pull—how to write convincing sales letters, how to make more money whether a back-lotter or on the farm. Sixteen great lessons neatly bound and the Ad-Charts endorsed by students, breeders and poultry journals the country over. I am so confident that I can help you that I am willing to send it to you on approval.

Build Knowledge and Power to Achieve

The pages of this inspiring course bristle with hints, and suggestions and knowledge of lasting use and value to the man of brains and ambition. A casual glance through it reveals such topics as Opportunities to build profitable trade in

pure bred Poultry and Eggs for hatching—What the ad must do—Who is a born advertiser—The human element in advertising, and sales—Analysis of advertising—How to write classified ads—How to write your catalog and sales literature—How to write sales letters that produce the orders—How to estimate advertising cost—Contracting for space—How to make sales at poultry shows—Market poultry sales, etc.

This Is But a Mere Suggestion

Of the hundreds of valuable subjects covered in this vital work. It is by no means an attempt to brief out the scope of the course. The few suggestive titles just presented are merely the result of hastily glancing over a number of pages of the course, and besides there are the Ad-charts—tools for the ad writer.

Only \$2 Down—Money Back If You Wish

Only \$2 down and \$2 a month until \$6 in all has been paid (or \$5 in cash), and this great work is yours. Sign and send me the coupon below with \$2 and I will send you the complete Home Study Reading Course for five days' examination. If at the end of that time, the work is not satisfactory, you may return it at my expense—The complete Course consists of sixteen lessons with illustrations, substantially bound and sold for \$17.50 cash. The four ad charts (\$2 each) included. I offer it now for a limited time for only \$5 cash or \$6 on time. By signing and sending the special application from below you may now obtain this complete course at the special price and on the easy terms outlined.

Special Installment Privilege Coupon

C. D. GRAVES, Mng. Dir., Springfield, Illinois.

Dear Sir:—Send me "GRAVES COMPLETE HOME STUDY READING COURSE INCLUDING GRAVES AD-CHART SYSTEM." I enclose \$2 and will send you \$2 a month until I have paid \$6 in all if the course is satisfactory. If it is not satisfactory, I may return it at your expense within five days after receipt. You refund money paid and I owe you nothing.

LADY PURITAS

MOVED

Every Nest on
My Farm Is a
Trapnest same
as usual.

LADY DID
Laid 317 Egg in Year

S. J. Schenk and his wonderful heavy laying PURITAS SPRINGS LEGHORNS

which he originated, many years ago, moved to Avon Center Road, Avon Lake, Ohio, 13 miles west of Cleveland. The increasing demand for Puritas Springs Leghorns compelled me to buy a better located farm. I now have one of the finest 30 acres in the U. S. A. for my great layers. Visitors are welcome. In the past several years we could not supply half the demand for hatching eggs, baby chicks and stock; and this year the demand has been greater than ever. We have a grand lot

of breeding stock, ready to lay Pullets, early March and April hatched, pedigreed, beautiful Cockerels at reduced prices. S. J. Schenk gives all orders personal attention, and you will get stock that you can be proud of. Send for our reduced price list. Puritas Springs Poultry Farm, Box 111, Avon Lake, Ohio. S. J. Schenk, Owner & Mgr.

Homestead Silver Campines

The vigorous strain—dominate in the world of Campines. The wonderful BELGIAN fowl—noted for their heavy egg production—"THE EVERYDAY LAYER" unequalled as BROILERS. These birds are not alone FAMOUS for their UTILITY, but are BEAUTIFUL and MOST interesting. Some wonderful breeding stock for sale directly after the breeding season closes but now is the time to book your order that you may not be disappointed.

Eggs Half Price Balance of Season.
HOMESTEAD CAMPINE FARM, Box A, WAYLAND, MASS.

WYANDOTTES-SILVER, GOLDEN AND WHITES
Winners at New York, Chicago and Boston. Eggs from fine matings reduced to \$3 and \$8 per setting. Utility eggs \$2 per setting; \$9 per 100. Breeding stock at one-half price, consisting of fine show, high-class stock birds. Also Golden Sebrights. Circular.
IRA C. KELLER, BROOKSIDE FARMS, Box 75, PROSPECT, OHIO

Wilson's S. C. White Leghorns

YEARLING HENS and MATED PENS FOR SALE
Glenn A. Wilson Box 10 Sandwich, Ill.

egg production. Feed sprouted oats, cabbage, mangels, or beats. I prefer sprouted oats. Make eight boxes of uniform size, 12x24 inches, and four inches deep. Cover bottom of boxes with oats, moisten well, and lay wet burlap sack over oats. Stack boxed in warm place in basement or furnace room, and keep oats moist. In eight days the nice green succulent feed will be ready for the hens—and they are always ready for it. As one box is emptied, fill again, thus using the boxes in rotation.

To the grain, mash, and green feed, add pure beef scraps, cut bone, milk, or blood meal. Feed this with caution. And don't forget the grit, and oyster shell.

Does anyone say all this is too much bother and expense? Then do not expect eggs in the winter time; but after all it is not "too much bother," for whatever brings results is worth while, and if the hens are cared for and fed right, they will surely treat you right, and you may always expect to have to carry out the biggest basket on the place when you gather the eggs. Try it and be convinced.
D. Dee Rees.

1½ to 2 quarts of the scratch grain in the morning in six to eight inches of dry litter, with the mash in open hoppers before them at all times. Then feed six to eight quarts about one and a half hours before roosting time. The morning scratch will not be all that they will want and will make them scratch for more grain. Feed for 100 hens.

S. J. Schenk, proprietor, Puritas Springs Poultry Farm. Mr. Schenk has moved from Berea, Ohio, to Avon Lake, Ohio. A thirty acre farm which he has bought will be devoted entirely to his S. C. White Leghorns. During the past several years the old farm could not supply half the demand for eggs for hatching, baby chicks and stock, and 1921 has been the best year of all. As the land was hilly there was no more room for buildings. The new farm is better suited for poultry and more ideally located, and will allow for greater expansion of the business. It is 18 miles from Cleveland and an equal distance from Berea, Ohio. Visitors are welcome.

The partnership heretofore existing between Minnie Wershing and Sylvester Schenk, under the firm name of Puritas Springs Poultry Farm, was dissolved by mutual consent August 3rd.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

What do you think of Florida grown sweet corn and pea seed to sow in northern Illinois for an early crop? The address of one or two Florida seedmen would be appreciated.

Fred J. Kline.

Do not plan. Florida grown sweet corn and peas in Illinois. Secure your sweet corn and pea seed from a point north of your location. The Harris Seed Co., Jacksonville, Fla., is a reliable firm.

* * *

Will you please advise me whether the following apples will do well in this part of the country: Black Ben, Golden Delicious, Delicious, Stayman's Winesap, King David.

E. N. Johnson.

The varieties you name are especially adopted to your conditions. You cannot improve on this list.

* * *

Having read with interest some of your articles in the American Poultry Journal, would like your opinion on the venture of buying about 80 acres within a radius of ten miles of Battle Creek, for the purpose of a small dairy farm, also some poultry. Do you know about the land in that district? Do you think a man 52 years of age with two boys, one 14 and another 12 years of age, could make it go?

William Williams.

Iowa.

The land in the vicinity of Battle Creek is very productive. It is capable of raising profitable crops.

Yes, I think you and your boys "could make it go" on such a farm there. Why, a man 52 years old and two good, willing boys can make anything "go" anywhere.

* * *

I bought a place in Geneva, Ill., last summer. Soil is very rich and I must be able to raise good garden stuff; but I want to plant a few fruit trees. Apples and pears will grow here, also peaches and plums. The neighbors tell me the ground is too rich and that the trees will grow too much wood and not fruit. Is there anyway I can put sand or ashes in the soil when I plant the trees and thus make the land poorer. What peaches and plums are best for me to plant?

Illinois. Carl Hagnusen.

Pay no attention to what your good neighbors tell you about trees growing too rapidly, and do not put any sand or ashes in the soil when you plant the fruit trees. You can control the wood growth by proper pruning. Advise you to plant Delicious, Wealthy, King David and Henry Clay apple trees. Do not plant many peach trees. You are not in a peach country. Plant just a few Early Elberta, Elberta, J. H. Hale and Krummel peach trees. Plant Omaha, Terry and Surprise plums.

* * *

I have been thinking of buying some land in Florida and would like to hear from you in regard to your belief of such a proposition. I want to raise chickens on a small scale, and also citrus fruits and vegetables. To what section of the state would you advise me to go and about how much land would you think would be necessary to start on?

West Virginia.

M. W. Schobs.

I believe that such a proposition is feasible, because I know there are many such farms in Florida which are profitable. For 17 years I have spent six months of each year in Florida, and know conditions there. The best citrus sections are well down into the middle of the state, on the east coast. Miami is the center of a wonderfully produc-

tive section so far as poultry and fruit growing is concerned. Then there is the Orlando section with De Land and Orlando as the centers. The poultry business is fairly booming there. Last winter I found many successful fruit and poultry farms in that section. Over on the west coast the Fort Meyer district is a splendid citrus section. Go down and make a thorough investigation. I know you will find it to your liking.

* * *

What kind of a country is it around Morristown, Tenn.? I am a young man 19 desirous of learning the poultry business. I thought I would go to Morristown as I understand it is a center for White Leghorn egg farms. I have a common high school education and am intelligent. Do you think I would have any trouble getting employment on a plant there? I have read in the poultry journals that Petaluma, Cal., and Vineland, N. J., were big centers for White Leghorns.

Texas. M. A. Green.

Morristown, Tenn., is in the eastern part of the state, in Humble County. The county is mountainous. The population of the city is about 20,000. You could, no doubt, secure employment on a poultry ranch there or upon a poultry farm in California or New Jersey were you to apply in person for a position. The poultry business is not as highly specialized in Tennessee as in New Jersey and California.

* * *

Will you please tell me where I can secure maps and descriptions of the Michigan fruit belt? I should like to have maps and charts of the general topography, climate and soil. Also information about the price of land both planted and unplanted (with orchard).

Which is the best portion of the Michigan fruit belt to locate in if one intends to raise poultry for eggs, market and hatching egg sale? I should like to get in touch with some one who has land for rent, preferably a fruit farm, and get acquainted with the peculiarities of the climate and soil, after which I propose to buy a place. In view of this fact I want to go there this Fall and work with some man who needs help on his place and study the situation on the ground, thus enabling me to make a better decision and choice. Is this all right? Please tell me how I can get in touch with some good fruit grower who can use a good man who is not afraid of work and wishes to learn all he can about fruit growing and marketing. I am a supervisor of Manual Training, employed in the local High School system, but want to work in God's great outdoors.

J. Alex Roling.

Minnesota.

You can secure maps of Michigan and other desired information by writing to the State Agricultural College at Lansing, Mich. The best fruit section of the state is along the shores of Lake Michigan. I strongly advise you to make a trip through the fruit belt. By so doing you can secure the information you desire and thus get in touch with the growers. You can then, no doubt, make such a connection as you seem to desire.

* * *

I am thinking of starting a poultry and dairy farm. Would like to locate around Paragould or Nettleton, Ark. Can you tell me about what price the land sells for an acre and if I could find cutover land, and at what price. How are market conditions? Or what market could I ship dairy produce to?

Ohio. F. Jones.

There is a great amount of cut-over land in the section to which you refer.

WILLIAMS DURABILT POULTRY HOUSES

Cut Tire Expense

Learn the Money-Saving in a RELIABLY Reconstructed Tire

WE buy—direct from factories of nationally-known, standard tire makers—large quantities of carefully selected cord and fabric “seconds” and tires returned for claim adjustments. In our own factory, an expert takes them apart and discards all imperfect material. Then, highly skilled workmen re-assemble the tires—using only strong, perfect, flawless parts in place of the rejected material.

The Mileage Our Tires Give and Our Binding Guarantee

The Keeps-Tire Guarantee is for actual replacement, instead of adjustment. Our signed statement, sent with every tire, guarantees you 1000 miles service—or another tire. But we believe all our many, steady customers, would tell you that the Keeps-Tire—for long-wear and riding-qualities—compares creditably with first-grade standard tires that cost many dollars more. Often cuts down customers' former yearly tire expense at least half! Order by these prices:

Size	Tires	Tubes	Size	Tires	Tubes
30x3	\$5.50	\$1.65	34x4	\$9.25	\$2.60
30x3½	6.50	1.80	34x4½	10.75	2.85
32x3½	7.50	2.00	35x4½	11.00	2.90
31x4	8.50	2.40	36x4½	11.25	3.00
32x4	8.75	2.45	35x5	12.00	3.20
33x4	9.00	2.50	37x5	13.75	3.35

Simply state whether you want straight side or clincher, plain or non-skid. Send \$2 deposit for each tire ordered; \$1 deposit on tubes;—balance C.O.D., subject to your examination and approval of the goods. (Express rate—postpaid outside New York City zone, as is customary—amounts to little.) 5 per cent discount if full payment is sent with order.

Healthy Trees—Sound Fruit

FRUIT should be a profitable sideline on every poultry farm. But to have healthy trees and sound fruit, thorough spraying with right materials is necessary.

SCALECIDE

THE COMPLETE DORMANT SPRAY

"Makes a Tree Outgrow Its Troubles"

controls scale of all kinds as well as Leaf Curl, Apple Canker, Collar Rot, and even Blight Canker. It kills the eggs and larvae of insects such as Bud Moth, Case Bearer, Leaf Roller, also Pear Psylla. It "Makes a Tree Outgrow Its Troubles."

For a summer spray use "Sulfocide" with Calarsenate. Write today for folders. Address Dept. 21 B. G. PRATT CO., MFG. CHEMISTS 50 CHURCH ST. NEW YORK CITY

TO THE LARGE POULTRY FARMS IN THE EAST

Have you an opening for an experienced man as Assistant Manager or in an executive capacity or will you have such an opening within a year or so?

I have six years practical experience with Leghorns on a commercial scale; familiar with most branches of the business and offer the advantages of a good education and a thorough business experience. I am successfully running my own farm but for reasons beyond my control, may be forced to relocate. A personal interview can be arranged. A location within reach of New York or Philadelphia would be preferred. Please address E. F. B., care American Poultry Journal, 523 Plymouth court, Chicago, Ill.

SCOTCH COLLIES

Pure white and sable and white. RUS-SIAN WOLFHOUNDS and Hunting Dogs; first-class stock. Rhode Island Reds, White Leghorns, White Wyandottes and Anconas Stock and Chicks. EDGEWOOD POULTRY FARM, R. F. D., Plantsville, Conn.

It can be bought from \$25 to \$50 an acre. Kansas City would be the best market for wholesale shipping. There are good local markets nearer.

* * *

Your horticulture for poultry keepers prompted me to plant about 40 peach (mostly J. H. Hale) and apple trees (mostly Delicious) several years ago. Had a fine crop of peaches from several trees last year and now the apple trees are coming into bearing. Here is where my trouble begins. Two trees, a Golden Winesap and a Stayman Winesap, both set some fruit this year, but the twigs with most of the blossoms dried up as though they had been burnt, leaves and blossoms turning black before fruit formed. The Golden Winesap has made a very rapid and luxuriant growth and from what I can find in books I have the disease resembles twig blight. Will you kindly advise what the trouble is and also the best remedy. I hesitate to remove the trees now that they are starting to bear, but would do so rather than infect the rest of them.

Indiana. John Rheinhardt.

The trees are affected with blight. You cannot now spray them with good effect. Trees sprayed with scalecide in Fall and Spring, when dormant, rarely ever blight. Cut off all blighted parts, and be sure to spray with scalecide this Fall and next Spring.

* * *

I always wanted to go into the poultry business but am limited in capital. Would you advise buying just a few acres providing just enough space for fowls, getting good equipment and buying all your feed, or to buy large enough place to have some land to cultivate even if you did not have much money left to invest in poultry and equipment?

I have between \$4,000 and \$5,000. I like to get a good location for a poultry farm that is neither a prairie or mountain district, just between the two. Do you think the State of New York or Missouri near Ozark Mountains suitable? I might say I have farmed the larger part of my life.

Please give me your advice how much of my capital you would invest in land and if possible where I could find location I spoke of.

W. A. Higgins.

Pennsylvania.

You will make a serious mistake to establish a poultry plant, I mean a commercial poultry plant, on ground sufficiently large to accommodate the fowls. By all means purchase considerable acreage. Make your farm a general purpose one, poultry, fruit, dairy. You will find such a farm profitable. New York has all possible advantages. You can secure good farming land there at reasonable price. The Ozark Mountain land in Missouri is good fruit land. The first bottoms are good farm lands. Prices are lower than in New York.

You should reserve some capital. You cannot equip a farm and pay very much on purchase price with the amount of money you have.

* * *

I expect to put out a small family orchard next Spring and would appreciate your advice as to best varieties. Ground is warm, loose, limestone soil, sloping gently toward southwest and fairly high for this location. Wish to have a few apples, peaches, blue freestone plums, cherries, also blackberries and black raspberries and some grapes. Was planning to put apples toward the top and berries at bottom with the other trees in between. Do you know of any nursery where the ox-heart cherry can be secured? We had these at home in southern Indiana and they made fine shade and produced wonderful crops.

Kentucky.

George E. Gill.

Advise you to make your plantings as follows:

Apples—Delicious, Golden Delicious, Stayman and Senator.

Cherries—Montgomery, Royal Duke, Lambert and the Oxheart, of which you speak. Any prominent nursery can supply you with trees of this last named cherry.

Peaches—Early Elberta, Elberta, J. H. Hale, Krummel.

WINTER LAYERS and CHOICE BREEDERS

Two hundred S. C. White Leghorn yearling hens waiting to build a foundation for someone. These birds are now on free range and will be fit and ready for winter laying and early breeding. Prices greatly reduced. Write your wants. Circular free.—Vinewood Farm, Highland Park, Ill.

Grapes—Moore's Early, Eclipse, Luta, Diamond, Niagara, Worden and Concord.

Raspberries—Royal Purple, Cuthbert and Cumberland.

Blackberries—McDuval and Blowers. Your plan of planting is a good one.

* * *

I come asking for some advice. Will say that I am getting old with just myself and wife, both 69. Our children having left us we want to go where the climate is mild, both Summer and Winter, where the water is good and plentiful, with good health conditions—no chills or malaria; and want to buy a small place, say 40 acres, well improved near a good market for eggs and milk products. I want to keep a few cows, 300 to 400 hens, where I can have plenty of fruit for home use. Am not hunting rich valley or bottom land for general farming but more of a health resort as I have quit general farming. Can pay cash for the right place at the right price.

Now, I have been thinking of looking up southwest Arkansas. Can I find what I am looking for there? If so, what particular location would you prefer? I want this to be my last move. What do you think of the country that I have mentioned?

We have a very healthy country here but the gnats and flies are almost unbearable for man or beast. J. H. McNabie.

Oklahoma.

I wish I could wisely advise this man. A man nearly 70 years of age should not be looking forward to operating a farm. It is almost a tragedy, a case like this.

My correspondent will find land suited for his purpose in the section of Arkansas to which he refers. I know of no such perfect climate as he demands. The nearest approach to such a climate is that of western North Carolina.

* * *

In answer to B. F. Wallace, Florida: The Avocado pear is grown to perfection in the section of which Miami is the center. The production of this fruit is very profitable.

The King orange is very profitably grown in this same section. It commands a high price. The tree is not a heavy bearer and the fruit is a poor shipper. However, it pays well and I certainly would plant at least one-quarter of the grove to this variety.

The fruit land is not, as a rule good truck land.

* * *

In reply to Mrs. H. O. Blakely, Illinois: Spray your fruit trees with arsenate of lead. This will kill the worms which are eating the foliage.

* * *

I would like to have your advice on the kinds of fruit to raise for home use on a small place. Want some apples, peaches, pears, plums and cherries, also some small fruits, raspberries, strawberries, gooseberries, and currants. We are located in south West Virginia, in Wise County. I want to know what varieties of fruit are best for our locality. We raise poultry on a small scale, keeping Black Langshans. I have found these to be the best all round breed.

Virginia. E. E. Horne.

You will find the following plantings suitable to your section:

Apples—Delicious, Stayman, King David, York and Golden Delicious.

Peaches—Early Elberta, Elberta, Red Bird, J. H. Hale, Krummel.

Pears—Keifer, Seekel, Bartlett.

Plums—Red June, America, Surprise, Perry and Hawkeye.

Cherries—Montgomery and Suda Hardy.

Raspberries—Royal Purple, Cuthbert and Cumberland.

Grapes—Morris Early, Diamond, Niagara, Worden and Concord.

Strawberries—Senator, Haveland, Gibson and Sample.

Gooseberries—Oregon Champion.

American Poultry Association at Seattle.

(Continued from page 814)

included. It is not plain whether this illustration is to be of a meat type, or egg type or a dual-purpose type.

Mr. Lewis, who is to prepare this market part of the Standard, is not to attend all committee meetings where breed characteristics are discussed; but is to be subject to the call of the committee. The recommendation that would have put Light and Dark Brown Leghorns back into the same class was tabled.

The Committee of Forty recommended that, in order to increase the revenue of

The Knoxville meeting will be of tremendous importance to every purebred breeder in America. The Standard Revision Committee will render its report at that time. There was a feeling at Seattle that the Seattle meeting was only preliminary; that Standard matters could not be definitely settled at that time; and about the biggest thing that could be done was the employing of a Field Secretary.

The financial statement submitted at Seattle showed receipts for the year ending June 30, 1921, to have been \$25,809.29. The treasurer reported a balance of \$9,182.37. The Standard fund is low. Although 20 per cent of all

monies received from the sale of Standards must go into a Standard reserve fund, the new breed books have been considered as Standards and the Standard reserve fund appears to have been drawn on to finance their publication, with the result that the Standard Revision Committee is faced with a Standard Reserve Fund of only \$1,195.35.

The eastern men who attended the Seattle convention had a trip of a life-time.

Notwithstanding the preponderance of Pacific

Coast egg farmers in the convention, the only thing adopted on the production phase of the report of the Committee of Forty for insertion into the Standard of Perfection, was something on scoring and judging eggs in shell and dressed poultry. Geo. Hackett made a strong speech against production classes of laying hens in old feathers, and pullets in the lay.

Exhibitions will be conducted in the future as in the past and breeders should hue to the line that half a century of progress has proved to be correct.

E. C. Branch, Lee's Summit, Mo., will serve as chairman of Standard committee.

Officers of the A. P. A.. Seated from left to right, front row: Collier, Hayes, Burton, Adams, De Lancy. Back row: Martin, Mrs. Forbes, Hackett, Rigg, Mrs. Campbell, Cooper, Fishel, Nourse, Delano, Pape.

the association the poultry show associations should be charged a fee of \$10 to \$100 each for the privilege of using the A. P. A. show rules and the Standard of Perfection. Some objections were raised by officers of poultry show associations and by judges, who maintained that this charge would work a hardship on a great many shows. The plan was adopted by the convention.

Although the A. P. A. show rules provide that only special prizes can be awarded to Light Barred Rock males and Dark Barred Rock females, one judge, judging a southern fair, allowed birds in both of these special classes to compete for the sweepstakes prize. The judges' section of the convention instructed its secretary to write to the fair association, that the judge in question was in error when he made that decision.

The judges voted to have uniform contract blanks for poultry show engagements, same to be published by and purchased from the A. P. A.

Appropriate resolutions were adopted by the convention on the death of Worthy Past President E. E. Richards and Walter Hogan, who is remembered for the study he gave to the correlation of body conformation to egg production.

The next meeting will be held at Knoxville, Tenn., second week in August, 1922. As a rule the annual meeting is not announced this early, but the directors got together at Seattle and settled this matter. One of the greatest conventions the Association ever held was at Nashville, Tenn., in 1912, and Knoxville will have an entire year in which to arrange an equally splendid program.

A winning Everlay Strain Brown Leghorn male. Owned by H. V. Tormohlen, Box 2, Portland, Ind.

Poultry Census.

Washington, D. C.—The Bureau of the Census, of the Department of Commerce, announces, subject to correction, the following preliminary figures from the 1920 census of agriculture for the United States, with comparative figures for 1910:

Chickens on farms, eggs produced, and chickens raised—United States totals.

Chickens on farms:	
Jan. 1, 1920.....number	359,537,385
April 15, 1910.....number	280,340,959
Chickens eggs produced, estimated total:	
1919.....dozens	1,656,267,200
1909.....dozens	1,574,979,416
Chickens raised, estimated total:	
Increase.....dozens	81,287,784
Per cent of increase.....	5.2
Chickens raised, estimated total:	
1919.....number	473,923,935
1909.....number	460,605,709
Increase.....number	13,318,226
Per cent of increase.....	2.9

In making any comparisons, however, the change in the date of enumeration, from April 15 in 1910 to January 1 in 1920, must be taken into consideration. Since many chickens are slaughtered or marketed every year between January 1 and April 15, an enumeration on the latter date would show a smaller number of chickens on farms than one made in January of the same year. The number of chickens shown for 1910 is therefore too small for a fair comparison with the 1920 figure. The effect of the change in the date of enumeration would be most marked in those states where many chickens are marketed during the first 3½ months of the year, and less important in those states where most of the surplus stock is disposed of before January 1.

The number of chickens on farms, as reported for 1920, exceeds the number reported for 1910 by 79,196,426, or 28.3 per cent. The actual increase, after making allowance for the change in the date of enumeration, would doubtless be considerable less than this, and might even be about as low as the increase in the production of eggs, 5.2 per cent.

The states reporting the largest numbers of chickens on hand in 1920 were as follows: Iowa, 27,746,510; Illinois, 25,120,643; Missouri, 24,883,985; Ohio, 20,232,637; and Texas, 18,062,662.

The production of chicken eggs on farms in the United States in 1919 was 1,656,267,200 dozen, as compared with 1,574,979,416 dozens in 1909, representing an increase of 81,287,784 dozen, or 5.2 per cent. The figures for eggs produced and chickens raised in 1919 and 1909 afford a fair basis for comparison, since they relate in each case to the production for a calendar year.

The number of chickens raised in 1919 was 473,923,935, as compared with 460,605,709 in 1909. This represents an increase of 13,318,226, or 2.9 per cent. Chickens raised do not include those hatched and sold as "baby chicks," but do include "baby chicks" purchased and raised, as well as all other chickens hatched and raised, even though they may have been consumed or sold before the end of the year. Estimates for incomplete reports have been made for chickens raised in the same way as for eggs produced.

Over-Crowding Arrests Development.

On most farms the amount of range for poultry is unlimited, yet a great many farm poultry keepers persist in growing their chicks year after year on the same small plot of ground, in many cases no provision being made for separating the young birds from the old stock.

As a result of this crowding the proportion of crow-headed, knocked-kneed, poorly developed birds on many farms is a sure warning of impending disaster for the flock owner unless different brooding methods are employed.

On many farms intestinal parasites have already become a serious problem and in many other places tuberculosis is gaining a foothold which threatens the prosperity of the poultry keeper. The foundations for both of these troubles are laid when the chickens are kept year after year on the same ground and particularly when the growing stock is not kept separated from the laying hens. On one farm visited recently the main group of the young stock has been raised in an orchard where chickens have been kept for the last two generations of the family. These birds showed particularly poor development with a large number of crow-headed culls.

On the same farm a small group of chicks hatched from the same eggs but raised by a poultry club member on a plot of ground away from the regular poultry yard showed a third

Mating and Breeding of Poultry

By HARRY M. LAMON and ROBT. SLOCUM

SENIOR POULTRYMAN
U. S. Department of Agriculture.

Ability Is Inherited, Breeding from an Untrapped Flock, Breeding from Trapped Stock, How to Mate Every Variety of Plymouth Rocks, How to Mate Rhode Island Reds, How to Mate Each Variety of Wyandottes, How to Mate All Leghorns and Orpingtons, How to Mate Every Variety in the Standard.

Successful Breeders Endorse This Great Book.

E. B. Thompson says: "The best on the mating and breeding of poultry that has ever been published and will prove to be invaluable to thousands of people."

H. C. Sheppard: "A remarkable work as it covers the ground thoroughly and efficiently."

H. B. Hark: "It will put the beginner on his feet from the very start and he will not have to breed poultry four or five years to find out whether he is right or wrong."

This is an entirely new and original work, ready for distribution. PRICE, \$2.50 PER COPY. 340 pages of heavy book paper, cloth bound, profusely illustrated.

C. S. Byers: "A revelation in Standard fowl breeding with a key to the Standard."

F. H. Davey: "It should be in the hands of every person in America who breeds poultry."

W. H. Card: "Its accuracy recommends its contents to every expert."

John S. Martin: "It covers thoroughly the perplexing points that are continually coming up in breeding."

Every breeder should have a copy. Now ready for distribution. PRICE, \$2.50 PER COPY. 340 pages of heavy book paper, cloth bound, profusely illustrated.

more size than other chicks of the same age in the regular brooding yard, and instead of showing a large per cent of culls these club chicks were vigorous, well feathered, broad backed, fine looking young chicks.

One lesson that many farm poultry keepers need to learn is the necessity for rotation of the poultry crop. This can easily be accomplished where moveable brooder houses are used and the location of the brooding yard is changed each year.

Sprouted Oats as a Green Feed.

After many years of close study many breeders in all parts of the country have come to the conclusion that nothing contributes more to the egg yield and puts the birds in better physical condition than a plentiful supply of sweet, tender blades of grass or succulent foods.

Did you ever notice how eagerly the young grass is devoured by fowls during the spring months, when the grass is of the finest quality; and how quickly the egg yield increases?

The nearest we can come to imitating nature in this respect is in supplying sprouted grain, especially sprouted oats, which can be so easily and cheaply produced in a modern sprouter.

Observation during past seasons with sprouted grain in hot weather when the grass is tough and fibrous shows that too little attention is often given to succulents in the ration. Of course one cannot do without grain or mash which contains animal protein, but one can waste a lot of money feeding concentrates alone without succulents in the ration to provide bulk.

If a portion of the grain fed is given in a sprouted form to growing stock they mature much quicker and at less expense. The older birds pass through the molt more quickly and in better condition when kept supplied with an ample quantity of succulent sprouted grain. The result is that the hens come back into laying condition earlier in the winter and lay more consistently through the cold winter months. Fertility also runs higher the next spring if the birds are given sprouted oats during the winter and are not strictly grain fed.

Dark Cornish—A Man's Fowl.

Down in Kentucky the men are partial to stock of great vigor, ruggedness and gameness. It is that trait in them that has produced their wonderful race horses like Man O' War and hundreds of other famous horses and cattle. It is that same trait that made them fall easy victims to the sturdy Cornish fowls. As one lean mountaineer put it: "These are a regular man's fowl," after handling a 12½-lb. yearling Cornish male.

Has it ever struck you that the Cornish are a man's fowl? They have the weight, sturdiness and activity.

Big of bone, powerful of muscle, quick and dangerous in battle, they are at times as much as a red blooded man wants to handle, but there is a certain reward in knowing you own a fowl that can be as docile as a lamb when handled right, yet as fearless and bold as a tiger when need be, for its own or its family's protection.

Cornish have a bold eye, a sleek, close coat of feathers, with muscle and sinews standing out like whip cords. They respond readily to gentleness, but never overlook mistreatment.

Cornish, you know, are part Aseel game of India, and were made in Cornwall, England, by fanciers of that country. The breed is to England what the turkey is to us Americans. English breeders often cross Cornish with Parking or other fine-boned breeds like the Faveralles for instance, to produce the finest table poultry. The Cornish is heavily meaty, but also heavy in bone. It stands strong and wide on powerful boned legs like a bull dog.

from the ravages of cunning hawks, just drop a few Cornish down on your farm. First at a very short distance overhead they are hard to discern, and again they are more than a tartar in a hawk's claws. I have never had a hawk make away with a Cornish hen or cock, and he must work lightning fast to get away with one of biddy's chicks if she is loose. Rats, snakes, foxes and other prowlers are all alike to her. She will give her life in protection of her young. And say, sonny, it will not be given without some fur flying either.

It is this characteristic along with their hardiness, which permits their roosting in trees, weathering the winds and cold storms and living a long and useful life. For the table they yield a tremendous carcass of rare gamey pheasant-like flavor of flesh, tender from the massive skull down to the mighty drum sticks. That makes the Cornish a real mean's fowl.

Ky. Frank R. Willis.

September Chicks in Southwest.

Have you ever tried out September chicks? Our beginning was by accident. We were away from home in August, 1918, and a hen stole her nest. On September 3, she hatched one chick, which grew into a fine young pullet. This pullet began to lay January 31, 1919. We still have her and she has never been broody and has been a continual layer—only taking about five or six weeks vacation at molting time. We think this is a record for a R. I. Red.

After studying over the matter we decided to try a small hatch the next September. On the 28th of that month, 1919, a hen brought off 15 fine chicks. Later from these chicks we selected and kept six big, fine pullets. By the 1st of March, 1920, all of these pullets were laying and of this bunch only one became broody that summer.

We tried again in September, 1920, but set them so they would hatch on the 5th of the month. We had 25 fine chicks and selected later 10 nice pullets from the bunch. These repeated our former successful experience, for all of them were laying by the 5th of February, 1921. They are still laying August 1, and none of them have shown any signs of broodiness.

We are quite enthusiastic over our experience with September chicks so far. The broilers come on the Thanksgiving market, when the price is usually very good and the pullets mature very quickly and begin laying at the time when our winter layers are beginning to slacken.

We have only a small "back yard," and never try to keep more than thirty hens. From this flock of thoroughbred Reds we have sold, since January 1, 1921, \$112.50 of setting hens, broilers and baby chicks, and \$94.15 of eggs. Besides this we have had eggs and chickens for table use.

Okla. Mrs. G. M. Walsh.

Feeding the Layers.

After the flush laying season is passed the hens begin to drop off in egg production. This decrease begins about the middle of June or the first of July, but can be held up considerably by

changing your feed somewhat. A great many breeders barely pay their expenses during late summer and early fall, because they do not understand how to feed their laying hens to keep them producing until late in the fall.

The method used in the laying contest at this station has given good results. We feed the regular laying ration, which consists of two parts of whole wheat and one part of cracked corn for the scratch ration, and equal parts by weight of the following ground feeds for the dry mash: wheat bran, wheat shorts, ground oats, corn meal, and 10 to 20 per cent of beef scraps or tankage, until the hens show a tendency to fall off in egg production.

When the decrease in production starts the ration is changed a very little. The composition of the ration is not changed but it is fed in a little different form. The morning scratch feed is discontinued and about 10 o'clock in the morning the hens are fed a moist mash made by mixing just enough water or milk, milk preferred, to the dry mash to make it crumbly. Just feed what the hens will clear up in twenty or twenty-five minutes. This has a tendency to stimulate the birds' appetites and therefore keep up egg production by getting the birds to consume a greater amount of the mash, which is the egg making part of the ration.

The following is the feeding program for the day: In the morning the birds are given enough buttermilk to last during the morning. At 10 o'clock they are fed all the moist mash they will clean up in twenty minutes. At 1 o'clock they are given water. The grain ration is fed at 4:30 when the eggs are gathered. The dry mash is before the hens in dry mash hoppers at all times.—Arkansas College of Agriculture.

SMOKE EM

CANNED SMOKE

REG. U. S. PAT. OFF.

THE GUARANTEE ROUP CURE was discovered on our breeding estate, where we breed registered Holstein Cattle, Spahr's Giant Epochal Berkshire Hogs, and our world's famous NONESUCH, Ferris White 300-egg strain leghorns. After losing several thousand dollars' worth of our valuable birds, we were determined to discover a cure for Roup, Colds, Canker, Diphtheria, Chicken-Pox, etc. After discovering and using "SMOKE EM" (canned smoke) we have not lost a bird. WE POSITIVELY GUARANTEE "SMOKE EM" (canned smoke) to effect a complete cure or every cent of your money back. Read what Mr. Jos. W. Smith of Burbank, Calif. says: I have tried "SMOKE EM" (canned smoke) and I know it does the work." Mr. Chas. Brantner, Polo, Ill., R. No. 7, writes: "SMOKE EM" surely is the best thing we have ever tried for Roup, Colds, Canker, etc. It is an absolute cure." Ex-Judge A. W. Ecker, of Woodsboro, Md., says: "I have used "SMOKE EM" GUARANTEE ROUP CURE, and find it a very excellent remedy for Roup. I used several remedies but "SMOKE EM" was the only one that produced an absolute cure." Thousands of unsolicited testimonials on file at our office.

Use Less Feed, Less Labor, And Get More Eggs

Don't worry about high feed bills. Use Norwich Automatic Appliances. These machines prevent all waste, supply feed when the birds need it, increase the efficiency of the ration, provide exercise, increase the egg-yield, and practically eliminate the labor of feeding. Official laying competitions have proven that Norwich-fed layers regularly average 20 eggs more than hand-fed stock. To make and save money, secure greater results with less effort, adopt the Norwich plan of feeding.

Make the test on one pen and compare results. Buy one or more Apaco Poultry Feeders from your dealer—or order direct from us if necessary—and let your birds prove that the Norwich way is right. Now is just the time.

The Apaco Feeder is sold under our guarantee of complete satisfaction. It holds 9 quarts and costs but \$2 delivered east of the Mississippi River—\$2.60 beyond. Order today. We will ship immediately.

The Poultry Fountain That Never Freezes

provides a constant supply of fresh, clean water regardless of temperature. Operated last winter in the extreme north at 32, 47 and 69 degrees below zero. Recent official investigations have shown water to be as essential to winter egg production as feed. The Norwich Automatic Air-Lock Fountain supplies water at just the right temperature, and eliminates the worry, annoyance and labor of frozen water.

Five gallon capacity. Price \$6.00, F. O. B. New London, Conn.

TRY THE NEW WAY TO KILL LICE

**NO DUSTING
NO DIPPING**

**NO PAINTING
HANG UP THE BOTTLE**

A hen worried to death with lice can't lay if she wants to, but she eats just the same. You might as well "throw money to the birds," as feed high priced food to lousy chickens. It's a dead loss—don't do it.

Licecil

Kills Lice

Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

READ THE EVIDENCE

IF YOU have never used Licecil and are inclined to doubt the claims made for it, just consider the letters which appear on this page. These testimonials are but a few of the hundreds that are continually coming in from satisfied customers from all parts of the U. S.

KEEPS ON USING LICECIL

Please find check for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.
J. D. ALLEN, Lynchburg, Va.

IT DOES THE WORK

I have used the three bottles of Licecil according to directions. It did the work all right.
OSCAR THOMPSON,
Long Beach, California.

WANTS MORE

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.
JOHN HOLTRAP,
Lynden, Washington.

VERY EFFECTIVE

Received shipment of Licecil, which I have divided with some of my friends. We have found it very effective.
HANS EYERSEN, Silver Creek, N. J.

PLEASED WITH RESULTS

Received Licecil sometime ago and am well pleased with results. Expect to use it continually hereafter.
FRED S. WILLIS,
Wyandotte, Michigan.

LARGER ORDERS

Enclosed find \$5 for six bottles of Licecil. Kindly rush this along and oblige. One of your satisfied customers.
EDWARD LEHR, Escanaba, Michigan.

REORDERS

I enclose \$2.50 for which please send me Licecil. I found Licecil very much better than anything I ever tried.
MRS. JOHN ANDERSON, Buford, Wyo.

KEEPS ON USING IT

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.
J. E. PLATT, Maywood, Ill.

THE BEST

I bot a bottle of Licecil from you some time ago and found it the best thing of the kind I ever used. Please send me another bottle for the enclosed.
MRS. L. M. JOHNSON,
Plumville, Pennsylvania.

LITTLE WORRY OR WORK

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.
BERNARD F. OSTERFIELD, Dayton Ohio.

SEND MORE

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.
L. G. STAYNOS,
Sherman, Texas.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

HOW TO USE LICECIL

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in a mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

MONEY BACK IF IT FAILS.

1 Bottle \$1.00; 3 Bottles \$2.50; 12 Bottles \$9.00—All Prepaid.

For More Eggs Next Winter

Ever since we first offered Ful-O-Pep Dry Mash to poultry raisers and drove home the truth that "Ful-O-Pep Dry Mash, not Scratch Grains, make eggs," thousands of poultrymen have proven the truth of our claim and profited by it.

In keeping with the recommendation of our helpful service department which we maintain for promoting the welfare of the poultry industry, we earnestly urge every raiser of poultry, large or small, to begin laying their plans right now for more eggs this winter when egg prices will be high. No better plan to follow can be found than the famous Ful-O-Pep Way. It consists of keeping

FUL-O-PEP DRY MASH

the great egg producing feed before your young pullets and laying hens *all the time*. Right now is the time to begin feeding Ful-O-Pep Dry Mash, to laying stock. It will bring your pullets to early maturity and put them in shape to "shell out the eggs" in large numbers next winter. Don't make the mistake of thinking your hens won't lay in winter—they will if fed the Ful-O-Pep Way. The success of the Ful-O-Pep Way is no longer questioned—it is the acknowledged way to greater poultry profits. Thousands of the most successful poultry raisers in the country have adopted it with results far exceeding their expectations.

Write for New 1922 Poultry Calendar

Our new 1922 Pul-O-Pep Poultry Calendar will soon be ready for mailing—write for your copy *now*. This book written by Albert Angell, Jr., our poultry expert, is one of the best aids to poultry success ever published. It covers every phase of the poultry industry—tells what to do—and what not to do—written by a man who knows and told in a simple, "easy-to-understand" way. Write for free copy today—

INTERNATIONAL HEADQUARTERS

"Aristocrat" Barred Rocks**The World's Greatest Strain of Poultry**

**The
Great
Money Makers**

Supreme as

—Showbirds

Supreme as

—Layers

Supreme as

—Market Fowl**AS SHOWBIRDS**

The famous Aristocrat Barred Rocks have created a new **WORLD'S RECORD** by their sensational sweep of victories in thousands of showrooms, including the largest and biggest Barred Rock shows of the entire world. The **NATIONAL B. R. CLUB SHOW** (the greatest of all the great ones) **CHICAGO**, "HEART-OF-AMERICA," **BOSTON**, **N. Y. PALACE**, **GUELPH**, **DALLAS**, **LOS ANGELES**, "TRI-STATE," **BROOKLYN**, **CLEVELAND**, **NEW ORLEANS**, **ST. LOUIS**, **WINNIPEG**, **PITTSBURGH**, **INDIANAPOLIS**, **MINNEAPOLIS**, **SAN FRANCISCO**, **DETROIT**, etc., etc., hail the Aristocrats as winners! **MY CUSTOMERS ARE WINNING OUT WITH "ARISTOCRATS" ALL OVER THE WORLD.**

AS LAYERS

The same magnificent showbirds are equally supreme as layers. **THREE HUNDRED SIXTY-ONE (361) EGGS FROM ONE MOULT TO THE NEXT BY AN "ARISTOCRAT" HEN IS UNDOUBTEDLY THE LAYING RECORD OF THE WORLD.** Equally matchless is the record of 260 eggs in 270 consecutive days by another "Aristocrat" hen. Many "Aristocrat" cockerels from my great laying record hens have been sold to State Agricultural Colleges. (Only yesterday I received a report from one of these colleges giving a record of 79 eggs in 79 days.) Can better evidence of their value be given?—From all over the civilized world "Aristocrat" customers are sending in glowing reports and laying records.

THE IDEAL MONEY-MAKING COMBINATION

EVERY WISE, PRUDENT BREEDER WILL DO WELL RIGHT NOW TO LOOK FOR THE GREATEST MONEY-MAKING COMBINATION IN POULTRY THAT HE CAN POSSIBLY GET. Let every breeder who reads this give some serious thought to this vital subject—**WHY NOT BREED THE GREATEST SHOW-BIRDS, THE GREATEST LAYERS, THE GREATEST MARKET FOWL—ALL COMBINED IN ONE?** This is the combination which will give you **MORE profit, MORE honor, MORE pleasure, MORE satisfaction** than any other. This you get in "Aristocrats."

Mr. M. L. Chapman talks about JERSEY BLACK GIANTS

I HAVE been breeding good poultry for many years. You know my record with White Rocks and White Leghorns. It is written in prize-lists of America's leading shows and laying competition records. So, after a quarter-century of earnest work in the poultry field I feel competent to express an opinion regarding the merits of a new breed. For years I have known the big, black birds that are now named Jersey Black Giants. For some time I have bred them. We first exhibited them at the last Trenton Show, Madison Square Garden Show and N. Y. State Fair, winning many leading prizes. I have found the Jersey Black Giants wonderfully satisfactory in every way. The largest of the real business fowls, they are good layers of big, brown eggs and make unusually fine table birds, particularly heavy roasters and capons. They are particularly strong, vigorous and rugged, able to stand up and deliver the goods under the most adverse conditions. Their eggs hatch well, the chicks grow like weeds and refuse to die. The early history of the Jersey Black Giants is much like that of the Rhode Island Reds. Bred for many

years by the farmers of central New Jersey, they have not been pampered or specially fed or housed. Under such conditions the weak ones died off, leaving only the strong and husky for breeding purposes. Further, they have been almost exclusively hen-hatched and brooded.

Selected specimens breed fairly true to type, but there is still work for the careful fancier and breeder in the way of smoothing them up and putting on a few finishing touches. This can be done quickly. Then we will have a breed that is at once very large, beautiful and highly productive.

The public demand has been created. It looks as though these Black Giants are due for a boom. This is your opportunity. Get in line now. Establish your flocks and cash in. I will supply you with foundation stock, pairs, pens or flocks, all birds carefully selected by me personally—all sure to please you. We grew a wonderful bunch of chicks this year and I admit they are good.

Write me today, state how many birds you want, and I'll quote bed-rock prices.

M. L. CHAPMAN, General Manager.

257 S. C. Rhode Island Reds at the New York State Fair

*They were the largest and strongest
class at this the greatest of
all Fall Fairs.*

Owen Farms Reds

won First Cock, First and Second Hen, Second and Fourth Cockerel, First and Second Pullet, First Old Pen, Second and Third Young Pen, and First Collection.

A Crashing Victory in the strongest Fall Class ever brought together.

More than 3,000 Owen Farms Youngsters are rapidly growing under free range conditions. Among them are exactly the birds you need to Win, Lay, and Pay.

They have demonstrated their winning qualities year after year at Madison Square Garden, New York; Boston, Kansas City, Chicago, and all other leading shows of the Country.

They have demonstrated their laying qualities in the trap-nests of customers and in laying competitions all over this Country and abroad.

They have demonstrated their paying qualities in nearly every civilized Country on the Globe. Flocks that average over 250 eggs each and individuals that pass the 300 egg mark in 365 consecutive days pay and pay well.

Co-Operation

with customers has been a very large factor in the success of Owen Farms. Come and visit my Farms if you can. See and handle this largest and best flock of S. C. Reds in existence. Have never known a visitor to be disappointed with what he found at Owen Farms.

If you cannot make the trip in person, make it on paper. Write me fully and frankly your exact requirements and I will talk with you and advise you on paper exactly as I would were you sitting beside me at my desk.

Owen Farms Buff Orpingtons are the best flock of all time, and of equal quality with the Reds.

You will find here on Owen Farms Cocks, Hens, Cockerels, Pullets, and Pens for showing or breeding to meet your exact requirements. Line-bred birds with long generations of perfect health, size, bone, and vigor, rich color, and a line that is prepotent and will stamp these characteristics on other flocks.

Owen Farms prices are never high and are based absolutely on the individual merit of the bird or birds, Star utility birds; Star breeding birds, Star show birds, all at prices you will gladly pay.

Remember—your absolute satisfaction is guaranteed and backed by my more than twenty years of Golden Rule treatment of customers. Owen Farms mating list is free for the asking.

CARE OF THE MATURING PULLETS

**Well Grown Pullets Are Now Starting to Lay—Liberal Feeding Required—
Thin Pullets Are in Poor Condition to Lay Steadily Through the Winter—
Provide Ample Roosting Space.**

By Otto E. Hackman

WE NOW find the early pullets laying or showing indications of commencing egg production. Their singing, the reddening of the combs and the frequent explorations of the nest boxes are all indications of getting down to business. But these indications alone are not sufficient to insure a full egg basket the coming winter. The maturing pullets must be carefully handled lest they be given a setback. One can make or mar a good winter layer or promising pullet at this time. Too many are too prone to neglect them now, when attaining good size and apparently able to look out for themselves. The good feed and care that was given them when small is lacking now—the early enthusiasm is gone. This is where the gravest mistake is made. Good care now is essential.

The pullets should be put in their winter quarters not later than the latter part of October or the first of November. The pullets should be in their winter home and settled down before they commence laying. Changing them from one coop to another or from one pen to another after they have commenced producing will tend to cause a check in egg production for a time. And not infrequently laying is not again resumed until spring. Fowls get accustomed to their home and do not take kindly to being moved around. The excitement incidental to moving, and the strange surroundings makes them nervous and flighty.

The Pullets Still Require Good Care.

One must exercise care in feeding the maturing pullets. When taking them from the range and putting them in their permanent winter quarters some are likely to put them at once on a heavy winter laying ration. Now, I am not in favor of making such an abrupt change. Rather, I want to make the change gradually and prevent the fowls from getting out of condition. It is advisable to stick to the usual rations for a time and then gradually work over to the heavy winter laying ration. Many fail to get eggs because they are not liberal enough in feeding the maturing pullets. They fail to realize that the pullets require lots of feed at this time—in fact all they will consume. They are, or should be, hearty eaters. It is when their appetite fails and they appear to not care whether they eat or not that trouble may

be looked for. They should be given all the feed they want and should be encouraged to exercise. At night, especially, they should have all they want. If any food remains uneaten, it does not matter, as it will be picked up in the morning.

Some contend that liberal feeding will get the pullets in an overfat condition. I have yet to find this true with growing pullets. In my opinion, no matter how much food they get, they will not take on excessive flesh. All the food they consume will tend to develop muscle and frame. It is only when the pullets have attained their growth, and egg production has not yet commenced, that we expect the surplus food to produce fat.

Give the pullets comfortable quarters, with ample roosting room, keep them free from vermin, give them plenty of good, wholesome food and pure water and they will show you the stuff they are made of.

Pullets on the Range, Petaluma, California.

The "laying feed" should be of two kinds. One is composed primarily of equal parts of cracked corn, wheat and oats. This should be fed in a 8 inch straw litter on the floor, and induce exercise. It is called the scratch feed. The other should be fed dry in open hoppers, and may consist primarily of equal parts of ground corn meal, ground oats, bran and middlings. Fifteen per cent of meat

scraps and 5 per cent of alfalfa or ground clover should be added to this mash. The birds should eat about twice as much mash feed as scratch feed. In order to obtain this result, limit the quantity of scratch.

If the birds have been grown on dry mash they will have big crop and intestinal capacity, and that is good, for a heavy layer must be a good consumer of raw material, feed.

One advantage of commercial mashes is the fine blend of all the mill feed and meat products, so that the hens take a mouthful of mash and do not sort around in it. Mash is easily digested and produces a large egg. It contains the animal protein necessary to make a balanced ration.

Sprouts of oats make a splendid green food; aiding digestion and providing bulk. A succulent, juicy, easily digested bulky food of this kind is very desirable in poultry feeding. In addition to these feeds the layers should be provided with grit, crushed oyster shell and plenty of fresh water.

Big Poultry Show at New York State Fair

Larger Entry Than Last Year—Quality the Best Ever Seen at an Early Fall Show in America—Fair Attendance—Judging Gave General Satisfaction—Awards and Comments on Classes.

By F. L. Platt

THE eighty-first annual New York State Fair was held at Syracuse, September 12 to 17. In the poultry department there were 550 exhibitors from 28 states. Rabbits and pet stock, which come under the head of the "poultry department," fell off from 1,300 last year to 748 head this year. Poultry made an increase of about 1,500 specimens over last year, there being a big increase in bantams, an increase in farm flocks from 63 to 78 flocks, and an increase of about 100 exhibition pens which is equivalent to 500 individual chickens. Pigeons held their own.

The show as a whole crowded 8,000 specimens, of which 5,100 were Standardbred poultry in the exhibition classes. It was a breeders' show, no string men coming together and swelling the entry.

Breeders put down the birds, and the quality in the classes was the nearest approach possible in September, to winter show quality.

John Martin, who was showing for the sixteenth consecutive year, told some of his friends one evening of the evolution of this great fall poultry exhibition. He spoke vividly of how the show was patronized by string men in the old days, of the rough condition in which the birds were shown, and how the breeders used to pan him for advertising Syracuse winnings. Times have changed. Some eight years ago W. H. Manning was made superintendent of poultry. He built the finest exclusive poultry show building in the world, at a cost of a hundred thousand dollars. He secured Madison Square Garden and Boston judges, and year by year Madison Square Garden and Boston exhibitors have come to Syracuse in increasing numbers.

Mr. Manning's dream has been realized. Today the show is national in character and breeders are mating and hatching and rearing their birds with Syracuse as their objective; they do not make their entries and exhibit as a second thought; they plan early and work long.

The heavy classes this year were Single Comb Rhode Island Reds, 255 birds; Barred Plymouth Rocks, 237 birds; Single Comb White Leghorns, 233 birds. In several varieties the quality was the best ever put down at an early show in America.

The old cock class still remains hard to fill. As a rule some of the best cocks are either in old feather that is dropping or in new feather that is not quite finished. Here and there you find a very late or very early hatched chicken that is betwixt cockerel and cock, and while these birds have a certain freshness about them, they lack the masculinity that commands the respect of student breeders.

Hens to win in the fast classes are in new neather and rapidly approaching winter show condition. For a time it looked as if the uninitiated public was going to become absolutely convinced that only hens in old feather at fall show time were of any value as production birds. Fortunately practical experience drives home the fact that hens in a hot, dry year like 1921 molt early, and that time of molting is governed by feed and conditions.

Heard and Seen.

Cockerels and pullets at Syracuse are a revelation to many. Said Theo. Hewes: "I never saw so much size in young birds—and finish of feather! There is a veritable sumptuousness of covering." Of course, here and there is a young bird, sometimes winning low, sometimes not even placed that gives promise of beating the winner with more age. Sometimes, as in White Orpingtons, the judge will place such a cockerel first; or, as in White Wyandottes, fourth. We would not criticize him either way.

Some judges have a definite policy. For instance, J. H. Drevenstedt said: "I quite agree that the second Black Minorca pullet will make the greatest bird. She has so much type and range that she needs a little more time to develop.

I must judge on present condition, not what the bird will be in two weeks, but what she is now in the competition of the hour; and give full credit to the exhibitor who puts down the bird that is fit right now." On the other hand is the argument that in young bird classes at an early show the specimen that is sure to make the "real one" with a little more age should be given the preference. Take your choice.

Judges should perhaps always be granted some leeway; but in one matter some of our best judges are growing careless, particularly since the talk of good utility hens fading their shanks. We refer to the common spectacle of pale shanks on many of the fowls that are winning. In those breeds in which yellow shanks are a breed character, the color of the legs should not be minimized. If breeders had not established yellow shanks as a breed character, "faded shanks" would not be a salient point in culling practice; there would be nothing to fade. Moreover, what would you do with the following White Leghorn hen that we saw on the poultry plant of the U. S. Department of Agriculture at Beltsville, Md., on our way to the New York State Fair: She had laid over 1,000 eggs in her life time, was the dam or granddam of several 200-egg pullets, yet on September 12 she was completely in new feather and had real yellow shanks. To cull her would mean the elimination of one of the best birds in the whole government flock.

Faded shanks have no place in white birds in our shows, yet a golden yellow shank almost scares some poultry judges. It would be hard to find in the White Leghorn classes a single bird with shanks heavily pigmented with yellow; most of the shanks are whitish yellow. At the present rate Black Leghorns are going to have the best yellow shanks in the show. This is not a figure of speech; it is a truth; yet the only breeding problem that compares with putting actual yellow legs on Black Leghorns is Harry Lamon's problem of getting pure white eggs out of his red-lobed Lamonas. Both are being done.

The English may not know how to wash and fit plumage, but they do know leg color and leg condition. Birds in an English show are put down with legs and toes true to color and in immaculate condition. In America the white shanks of the English breeds are appraised at their true value by judges. At Syracuse this year a wonderful Buff Orpington pullet was set out for a tinge of blue in her toes. The first White Orpington cock, shown by Greenshields of Canada, had shanks like one sees in an English show, both as to purity of color and condition. How about our American breeds? Yellow skin is their birthright. The early framers of the Standard, in many cases, decreed that shanks other than yellow should disqualify. There is already a serious question as to whether hens that exhaust their body fat and thereby fade their shanks produce as good hatching power in their eggs and growing qualities in their chicks. The time has not come when breeders or judges should minimize or overlook yellowness in shanks.

There was a fine aggregation of breeders at Syracuse. They appeared to form an important element of patronage at the city's best hotel. When the luncheon in honor of Hon. Nathan L. Miller, governor of New York, was tendered by the New York State Fair Commission at the Club House on the state fair ground, a large number of poultrymen were present by invitation. Mr. Manning has not only run a great show, with the capable assistance of W. M. Anderson and the other boys who get on the job early and stay late, but his wide acquaintance and high standing has been used to elevate the poultry exhibitors at Syracuse to a prominent and respectful position. The hog men, the horse men, the cattle men, do not cut a bigger swath. That is as it should be, for what class of live stock has a greater economic value than poultry and eggs?

Longer Days Through Use of Artificial Light

Artificial Illumination Increases Production in Short Winter Days When Egg Prices Are Highest—Lights Are Also Used to Hasten the Maturity of Late Hatched Pullets—How to Use Lights.

By H. G. Forster

THE point has been reached on the subject of artificial illumination for fowls to secure a heavier winter egg yield, where it is no longer necessary to convince poultrymen that such a thing is possible—it is accepted as a fact. I recall very plainly when this idea first began to be seriously discussed. It was then usually scouted by poultrymen, and even by those at the head of their profession. It is amusing to see some of these gentlemen now among our most enthusiastic devotees of the theory of "more light, more eggs." We all get on to the wagon of progress sooner or later, or are left hopelessly behind.

In the first flush of enthusiasm regarding the use of artificial lights on fowls to increase winter egg production, it was predicted, and often positively asserted, that this method was revolutionary—that lights solved every vexing problem concerning the securing of eggs during the cold months when hens had been in the habit of taking a long siesta. Perhaps no one could be blamed in those first years for feeling that they "had the world by the tail," so to speak, and that, defying Mother Nature, we had the elements, the seasons, and the hens at our mercy. As their first enthusiasm began to cool, and clear-headed poultrymen saw that lights, far from being an open sesame to the riches of bushels of eggs at \$1 per dozen, could turn and bite the hand that used them, gradually the idea began to take form that perhaps the use of an electric light bulb in a hen house in the middle of the night did not solve all poultry problems, nor that there were no attendant risks.

Experimental stations, as well as commercial poultrymen, have come to a number of definite conclusions concerning the use of artificial lights in connection with poultry. They may be classed roughly as follows:

That their use may be the cause of a direct loss rather than a gain in the production of winter eggs.

That there are wrong and right ways of using lights.

That their use and proper application must be thoroughly understood before definite and permanently successful results may be obtained.

That lights may either strengthen or weaken the stamina of a flock.

That hens under lights must be fed in a definite way before a satisfactory egg can be secured.

That the heavy winter production has a tendency to lower the spring yield, but not in all cases.

That lights have the tendency to increase the yearly egg yield, but not in all cases by any means.

That lights may be used in connection with other classes of poultry, besides layers, with satisfactory results.

Let us review each of the foregoing statements a little more fully, avoiding, for lack of space, any discussion regarding the manner in which these facts have been brought to light.

If lights are used over too long a period each day they have a tendency to weaken a flock. For a time, due to the excessive amount of extra feed hens are able to consume in a working day, they will lay quite heavily. But the reproductive organs, working overtime, and at too high a pressure, become overtaxed, and the inevitable reaction sets in. I have seen splendid flocks laying their heads off between Thanksgiving and Christmas, only to go all to pieces after the first of the year. Too much work, and not enough rest was the story. So, if you run your lights too long, you will lose far more in the end than you may have gained in the beginning. Once your flock is thrown off its track of production—and this applies particularly in winter—it takes weeks before it recovers, with a consequent heavy loss of eggs, and often loss of hens, both as layers and future breeders. So,

beware of the 16 to 18 hour a day winter schedule. A bit later we will give definite recommendations regarding the proper length of time, so reserve your opinions until then.

I think there are more wrong ways of using lights than right ones. One of the great troubles I have found in visiting poultrymen in this connection is the careless manner in which they use them. Thinking that a certain number of "light hours" per day, no matter how applied, did the trick, otherwise sensible poultrymen turned on their lights at six some mornings, at seven others, at four some others, and perhaps skipped a day once in a while, because they either forgot or did not get up in time. Beware of irregularity—it is worse, far worse, than no lights at all. A laying hen is finely attuned, and the matter of a half hour's difference in the use of lights for a day or so, will usually show in the egg yield. Be regular, more regular, most regular—let nothing interfere with your schedule. When you shut off your light supply in the spring, make the change very gradually—at the rate of ten minutes per day will be safe. Gradually merge your method into that of Nature's, and no bad after effects will be experienced. But if some fine morning you just decide to stop using lights, your hens are liable to do a number of things—and they won't consult you about it, either. They will usually stop laying at once, and then for extra measure go into a freak spring molt, which will certainly throw considerable sand in your plans for spring hatching, etc. So beware of irregularity with lights.

Before attempting to use lights at all, study the matter from every angle. Secure authoritative information from sources known to be the best. Consult your local experimental station or your agricultural college, or talk with some poultryman who has been successful in using lights. In New Jersey we find that the experimental station has done and is doing notable work along these lines. Cornell University at Ithaca, N. Y., is also responsible for much valuable propaganda. We find the West Coast possessed of much first-hand, practical experience and data upon this subject. Do not rest until you are sure of your information and method. Then go ahead and stick to it. Allow no local poultry "expert" to discourage you because, perhaps, your hens are not increasing their production quite so fast as somebody's chickens you never saw. Stick to your system, and your hens will yield a satisfactory profit, and remain in good health, which is, after all, one of the main things to consider.

Lights may strengthen your flock in this way: By allowing them the fowls some extra exercise each day and supplying them with an extra feeding of grain, their bodily heat and weight are maintained. Thus their systems are fortified against the winter's cold, and especially against the long, cold nights of that time of the year. The well-fed, well-lighted hen will withstand changes of temperature more easily than one who has spent 16 hours on a cold perch thinking of the warm spring days to come. On the other hand, lights may weaken your hens when you use them too long, or when your method of feeding does not nourish the birds properly.

I think the matter of properly feeding lighted hens has been the stumbling block for many poultrymen, and men who otherwise have had plenty of experience. Tests have now proven to us that the lighted hen requires an extra feeding of grains rather than extra mash. One of the functions of grains is to maintain bodily heat and weight, and if a hen is pushed for a heavy egg yield in winter, she must be supplied with this extra staying power to carry her safely into spring. The extra mash-fed, lighted hen goes to pieces quickly and easily. An extra feeding of soft mash does not sustain her sufficiently. The extra grain-fed, lighted hen will go through a hard winter with (Continued on page 900)

THE ROSE COMB WHITE LEGHORNS

Pullets Mature in Five to Seven Months—It Costs 15c Monthly to Feed a Growing Pullet—Advantages of a Rose Comb in Cold Weather—The Variety Presents Good Opportunities for Breeders.

By J. M. Chase

AMONG the one hundred or more varieties of domesticated fowls, it is very natural that some should achieve popularity to a greater extent than others, due in some cases to intrinsic merit in the variety itself and in other cases to the ability and foresight of the breeders supporting the variety.

A short study of the poultry and farm publications of the present day will immediately lead to the conclusion that, as a breed, the Leghorn family is far and away the favorite egg producing breed. Laying contests have established the superiority of Leghorns not only as layers but as economical consumers of feed, which combines to make Leghorns profitable producers. As a result, the Leghorn is almost universally used on egg farms throughout the world.

Of the several varieties of Leghorns, two or three have become most popular for one reason or another, because they excel in some one or more small particulars. Of the different varieties, the White Leghorn is especially dependable as a producer of all white shelled eggs; it is especially tame and intelligent and not pugnacious, although equally as active as other Leghorn varieties; and the whites can be very successfully run in large flocks because their plumage is not so thin or brittle that it breaks easily with the result that the birds take to feather eating.

To the eye of the great majority of fanciers, a white fowl in proper condition is most beautiful of all and to the butcher who dresses fowls, a white pin feather is least objectionable. These two facts automatically give the White Leghorn a dominant position, and make of them what some are pleased to call "the world's most popular fowl," with the popularity well deserved.

The two varieties of White Leghorns—Rose and Single Comb—are identical with the single exception of the comb—that is, they are of the same type, size, color and produce the same type, size and color of egg.

It must be admitted that the single comb variety is more popular in some sections, due chiefly, the writer believes, to the fact that they have fallen into the hands of breeders who realize the necessity and value of publicity, and as a result they have been ever present at poultry exhibitions, egg laying contests and their merits have been forcibly presented in the advertising columns of the poultry press.

On the other hand, Rose Comb White Leghorns are very widely bred, much more so, in fact, than the numbers exhibited or advertised would indicate, and they are gaining in popularity with increasing rapidity each year. For those not familiar with this variety the following general description will serve to identify them.

When properly bred the males range in weight from four to six pounds, depending upon age and care. The weight of the females ranges from three to five pounds. As a whole, the variety inclines to rather close feathering and for that reason the fowls are rather heavier than they appear to be.

Like all the Leghorn family, they are fowls of ceaseless activity, erect in carriage of head, but with the body long and carried rather horizontally. The ear lobes are white and the beak yellow, while all other head points are a brilliant red in color. The shanks and toes are yellow and the

skin of the same color, while the feathers are snowy white. The color scheme as a whole is the most beautiful yet devised in the poultry world.

Commercial Value of White Leghorns.

Like all members of the Leghorn family the variety produces eggs that hatch very well, and the chicks are especially hardy and mature rapidly. It is admitted that Leghorn chicks will reach a weight of $1\frac{1}{2}$ pounds as quickly as those of any variety and with rather less food. There is also another point of excellence which the Leghorn has and that is, at the broiler stage, they furnish more meat per pound of gross weight than the heavier varieties owing to the finer bones which they possess.

Rose Comb White Leghorn pullets mature in from five to seven months depending upon the food and care which they receive. It is safe to say that about six months is the average time required for maturity if the pullets are well grown. Those which mature at five or five and one-half months in any variety seldom attain full size.

The amount of food required to mature a Leghorn pullet is considerably less than that consumed by the other prominent breeds, and at present prices does not exceed an average of 15 cents monthly per pullet under average conditions.

When the pullet reaches the laying stage the investment period is over for Rose Comb White Leghorns, as they are most persistent layers and furnish a steady income practically the year around. In common with the other varieties of the Leghorn breed, they consume a minimum amount of food—lay a nice large egg, weighing 2 ounces each and upward. Needless to say the white shelled egg brings a maximum price in practically all eastern markets and a premium above the market price in many instances is not unusual.

The Rose Comb Is Practical.

At this point we reach the one fact which contributes so largely to the popularity of the Rose Comb White Leghorn. As extreme cold weather comes on the females lay steadily with little regard to weather changes. Their close feathering amply protects them while the low broad comb is practically frostproof under any reasonable conditions. In fact it is very noticeable that even on the coldest of days, with temperatures below zero, the egg yield runs very steadily and is highly satisfactory. In fact, reports last winter from points in Canada where the temperature ran from 20 to 30 degrees below zero for days, and weeks at a time, indicated that this wonderful variety made many new friends by steadily producing eggs with little regard to the extreme weather.

It is generally admitted that the hen with a frosted comb does not lay but there is another fact not yet so universally recognized which is well worth consideration. There is a condition of weather when the cold is of a very dry nature and even the single comb females do not appear to frost the comb but the egg yield does drop off without any corresponding drop in the food consumption. The explanation lies in the fact that the thin, wide blade of the single comb, filled as it is with warm blood, is radiating heat very rapidly indeed, and the fowl requires more food (Continued on page 906)

Good type in Rose Comb White Leghorns. The pullet won 2nd prize at the Madison Square Garden, New York, January, 1921.

FARM HENS THAT SCRATCH FOR A LIVING

Poultry Practice on the Farm is Changing—Efficiency Rather than Mere Low-Cost of Production is Bringing About Improved Methods—Modern Systems of Handling Farm Flocks.

By T. S. Townsley

A CERTAIN amount of scratching probably promotes good health, but most poultry keepers will agree that the poultryman should use some judgment about when and where this scratching should be done. Scratching in deep straw litter to dig out the rich morsels of grain is fine exercise for the hen and is a pleasant sight to her owner, but when the scratching instinct asserts itself while the hen is in the region of the garden or flower bed, the hen may enjoy her activities to the fullest extent, but the reaction on her owner is likely to be somewhat unpleasant.

The ability of the prehistoric hen to survive the rigors of nature was largely dependent upon her ability to scratch for a living; and through the ages grim necessity has caused the scratching instinct to become firmly fixed, and whenever any need for food is felt, the fowl, no matter whether hen, chick, or rooster, is likely to start digging in the most favorable appearing place. If this happens to be the petunia bed or the potato patch, so much the worse for the petunias and potatoes.

The idea of letting the hen scratch for a living is not entirely a prehistoric notion, but often expresses itself in modern times, especially during the spring and summer months. A good many owners of fowls have a notion that hens do not need to be fed during the summer time and are inclined to follow the line of least resistance by letting the birds scratch where they will instead of trying to furnish them enough substantial feed to satisfy their appetites and curb their desire to scratch. Nothing will make the hen scratch faster or dig deeper than the gnawing pangs of hunger, and where the flock is not being fed there is small wonder that a good bit of scratching is done at the wrong time and place. Thus, when a chicken stops to scratch directly in front of an oncoming automobile, it does this not so much to exhibit its foolhardiness but with the hope that it may be able to unearth another grain of corn before the car arrives. In some cases its recklessness may be due to a notion that quick death under the automobile wheel would be preferable to slow starvation which confronts the birds in many flocks.

A common fallacy which has done much to make poultry unpopular and unprofitable for many flock owners is the belief that hens will prove profitable where they are not fed. The uninitiated talk glibly about the profits from farm poultry, where the hens pick up a living and never have to be fed except when the ground is covered with snow, but the wideawake farmer, who is keeping track of his operations, will tell you that the hen is no miracle worker and that merely keeping a few of them will not enable anyone to get something for nothing. The hen cannot make eggs nor produce meat without food, and if she is not given her raw material in a legitimate manner, her conscientious scruples do not prevent her from taking whatever food stuff is available, whether it is intended for her or not.

Farm Hens Should Not Be Mere Scavengers.

On many farms where the hens live on the so-called waste products, they overrun the hog pens and feed troughs to snatch every possible bite of grain, while in other cases they stand around the back door of the kitchen or make a rush for the crib every time the door is open in an effort to secure a few bites of feed. In other cases the flocks that are not fed destroy several acres of growing wheat or oats and take up the corn for a considerable area near the chicken house. Then when the grain is ripe, the old hens will tear down the wheat shocks or eat all of the outside ears from the corn shocks as a part of their free feed bill. A small flock of hungry hens can quickly destroy several acres of crops when these crops are getting started, and only a little calculation

will show that this is an expensive method of keeping the poultry flock. The average hen will eat only about 75 pounds of feed in a year, so that the product of two or three acres if allowed to mature normally will make feed enough to feed 100 hens for the entire year, while if feed is withheld during a couple of months at planting time or during the early growing season, a hundred hens may destroy several times this acreage of crops.

The best way to keep the chickens out of the road from in front of automobiles, or to keep them away from the garden and flower beds, is to see that they have plenty of grain and mash regularly available.

A complaint sometimes registered against Leghorns and other fowls of the egg type is that these lighter birds are greater foragers than the heavier types and will therefore destroy more crops.

A farmer who keeps 500 Leghorn hens on free range on a twenty-acre plot was asked whether or not his hens were inclined to bother the neighbors. He pointed to a straw stack in a neighbor's field, less than 100 yards from his chicken houses and separated from them by only a dirt road and a barb-wire fence, and stated that he had never seen one of his chickens at the straw stack. An examination of the straw stack showed that the straw had not been scratched, though there was considerable grain lying around on the ground that the thresher men had not picked up. A peep inside this man's chicken houses showed that his large dry mash hoppers were full of feed which was always available to the hens. An inquiry brought forth the fact that though the month was August he was feeding a bushel of corn a day to his flock. This man had a fine garden and nice lawn, protected only by ordinary woven wire fence about forty-eight inches high. Trees in his orchard, which partly surrounds his chicken houses, were full of apples, and these showed no signs of damage from the chickens.

Modern Farm Poultry Keeping.

A marked contrast to this picture is the view of another farm where about 200 hens of a general purpose breed were kept. On this farm the owner tried to save money by not feeding the chickens during the summer months. Approaching his farm chickens were to be seen scattered in all directions from the house to a distance of at least a quarter of a mile. About five acres of the corner of the wheat field next to the house had been entirely eaten up by the hens. A considerable section of the corn field on the other side had also been destroyed. The yard was entirely devoid of grass. The garden had disappeared early in the season and was simply a mass of weeds. The apple trees were full of fruit, but as soon as an apple dropped from the tree it was pounced upon by the chickens, and all that could be reached by the birds had been pecked. An arbor of grapes on one side of the house was ripening, but the hens were jumping as high as they could reach from the ground and picking them off and the more active ones were on top of the rack and eating all they could reach from there.

On the first farm definite records of feed cost were being kept and the profits from the sale of eggs showed a return more than double the feed cost.

On the second farm no records were kept, but the owner stated that the hens had not laid to amount to anything since the first of July. He had been to no expense for feed for the birds, but the acres of corn and wheat destroyed were worth figuring on and would require a good many eggs to pay for their loss.

One of the labor-saving methods which has gained considerable popularity during recent years (Continued on page 921)

Strive to Improve Your Flock This Year

It Does Not Pay to Winter a Poor Pullet—The Best Quality of Stock Is Necessary for Successful Poultry Operations—How to Put Pullets in Good Laying Condition.

By Willard C. Thompson

EVERY year poultry raising in our Country is climbing steadily upward as a sound, profitable business venture for those people who are engaged in it. There are many reasons for this, among which undoubtedly are to be found an increased demand for poultry products of all kinds and an enlarged knowledge of how when, where, and why to do things connected with chickens. But, the poultry industry, made up as it is of great commercial poultry plants, farm flocks, and back-yard flocks, has not reached the point yet where those interested in it can afford to feel that perfection has been reached. In fact, some of us who are actually engaged in raising chickens bump up against many a problem that has not yet been solved, and reach many a point on which we would like further enlightenment. We're on the climb! We find out something new every day we feed the hens.

The beautiful days of autumn are here. Many of us really believe that October is the best month of the year. For the poultryman there is scarcely a more interesting one. For during this fall month the selection and finishing of the pullets is well under way, the weeding out of the good breeding stock is commencing to shape up, and the poultry houses are beginning to get all dolled up for the laying flocks that have rented the houses for the winter season. October is a month that is going to see many a new hand commence the work of raising poultry for pleasure or profit or both. It further is seeing many a heretofore established chicken man start all over again, this time to do things nearer right.

The writer has had several opportunities during the past few weeks to talk with prospective poultry keepers in a section of the country where the poultry industry is developed to a high degree, and these men and women have asked repeatedly what are some of the most essential things to consider when October rolled around. As repeatedly the writer has enumerated one factor after the other, but in every instance has he tried to leave the indelible impression that the man or woman who was going to make the real money out of investing in chickens was that man or woman who made a special effort to breed and produce the highest quality possible in their poultry. What does doing this mean?

Pure Bred and Standard Bred.

We are fortunate in this country to have breeds and varieties of poultry developed wonderfully well, from which we can choose. The writer can not believe there is an instance where or when it would not be advisable to start with pure-bred poultry, or for that matter to change over to after having disposed of the mongrels or cross-bred fowls theretofore kept. Pure bred fowls are those that have been bred through a sufficient number of generations to have in common certain characteristics that have become established and are transmitted at least with some degree of regularity from generation to generation. A breed of fowls is a race of fowls that have common characteristics as to form, shape, etc. A variety of fowls within any breed has well established characteristics as to color of plumage or comb shape, etc. A Standard-bred bird is a pure-bred bird that has been bred and developed according to a Standard or ideal. In

this country we have the American Poultry Association to thank for the Standard we now universally use.

There are reasons why pure-bred fowls or Standard-bred, as you choose, should be kept, if we would improve the quality, and incidentally the possibilities of profit, of our poultry flocks.

Pure bred fowls produce eggs and meat of more nearly uniform quality and size than mongrels.

One can breed pure-bred fowls and have a certain degree of assurance as to the chicks and poultry products he will get. They breed true.

Pure-bred fowls command higher prices.

The growing demand is for pure-bred poultry.

The raiser of pure, Standard-bred poultry can offer breeding stock, hatching eggs, baby chicks, pullets, cockerels, etc., and demand good prices.

It means a greater range of poultry products can be sold and a higher average price received.

Raising pure-bred poultry is lots more fun than raising a mixed up mess. That is, there is more pleasure in it.

Pure-bred poultry makes better and more efficient use of feeds than do the mongrels.

They will cost slightly more to get a start in than mongrels, but the argument is slight, for they will return far more on the investment than the others. And that is what counts.

After Having Selected Pure Breds.

Many of us, possibly most of us that read this magazine, are already converts to the pure-bred fowl. There is many another method whereby we can still aim to improve the quality of our poultry products this coming year. It is possible for even pure-bred birds to be off color, poor shaped, not true to type. They need a certain care and attention if they are to produce eggs or meat economically and well.

There is no more important poultry product than the table egg. Quality in it is absolutely necessary, if we are to retain our trade and get the highest of prices. The quality of the egg is measured by the bird and her feed and environment. We depend pretty largely upon the pullets for the bulk of our table eggs this coming winter. Rarely do we use the pullets for breeders, so their purpose in life should be to lay eggs and lots of them. They will do this if they are grown right and finished right. October is the month in which to do this finishing. It doesn't matter whether you have thousands or just a few, the same thing holds true.

During the summer growing pullets have been receiving a dry mash, composed of some such mixture as three parts of wheat bran, and one part each of wheat middlings, cornmeal, ground oats, and meat scrap. This should have been before them all the time, and supplemented with night and morning feedings of equal parts of wheat and cracked corn. Now as October comes it will be noticed that the pullets, particularly those of the lighter breeds, as the Leghorns, will show budding combs and signs of coming into laying maturity. In most sections of the country better results will be obtained if these pullets are held back in their rapid development just at this time, by closing off the dry (Continued on page 906)

Poultry Raising Combines Both Profit and Pleasure. Quality in These Columbian Plymouth Rock Pullets Have Made Owning Them Both a Pleasure and a Successful Business. Their Average Yield was 168 Eggs.

\$14,000 Last Year From White Wyandottes

Practical Points on the Care and Management of the Flock—Finishing the Late Chickens—Correct Wyandotte Type—How to Produce Yellow Legs and Pure White Plumage.

By F. L. Platt

AS THE visitor approaches the poultry plant of Chas. V. Keeler in northern Indiana, he notices the sign "Chickens—Drive Slow." Here on the banks of the Tippecanoe river are the growing youngsters of Mr. Keeler's strain of White Wyandottes; a strain that he has bred for 25 years; and in the last 15 years he has not introduced any new blood. Last year his sales from this flock amounted to \$14,073.50, and the year before they ran over \$11,000. "I didn't know myself what the business actually amounted to until I got to figuring up my income tax," said Mr. Keeler. Birds and eggs for hatching are shipped to nearly every state in the Union and many foreign countries.

This year Mr. Keeler's son, Kenneth B., age 20, has taken an active interest in the poultry. His father has started him on \$2.00 a day in money, besides his home and own Ford car, and ten years from now the young man will be stepping into his father's shoes, assuming the responsibilities and opportunities of an established breeding business. That looks pretty good to the other boys around town.

"Is there anything in the poultry business," is what a lot of people ask. "Well," said Mr. Keeler, "here is our home and farm. When Mrs. Keeler and I were married I had \$5 and she had \$10. We didn't have money enough to buy furniture. We started to breed White Wyandottes the year we were married.

The Start in Poultry.

"To tell what got me started in chickens you have to go back of that. I was raised in an orphan's home, where every boy had to do a certain piece of work. It fell to my lot to take care of the chickens. That was where my interest started. As soon as we were married I had to have some chickens. My first purchase was three pullets from a local breeder, and then I sent to Illinois for a cockerel; but I discarded all that stock after I went to a poultry show and found that what I had was not of good Standard quality.

"My first real chickens came as eggs from New Hampshire. I raised a wonderful cockerel out of those eggs, which I showed at Indianapolis in 1899. That bird was white and was the only white White Wyandotte that had been shown in the West up to that time. B. N. Pierce, the great Western judge of the day, was showing, but his birds were not of the pure white quill. I also won first pullet at that show and she was awarded championship for the best female in the entire show. I hatched 29 chicks out of those New Hampshire eggs and raised 26 chicks; they were grown just like babies; and were a sensation at the Indianapolis show of December, 1899.

"That exhibit put me on my feet as a breeder. I made enough money the next year to tear down the old house and build my present home. Now, I have purchased 10 acres additional land and am building eight new colony houses."

These buildings are 10 ft. wide and 16 ft. deep. There is a permanent open front to these coops. On the west there is a window 2½ ft. by 4 ft., and a window of equal size on the east side. These windows allow the out-door air to blow over the birds roosting in the coop in hot summer weather. As fall comes on the west window is closed, and when the temperature is freezing the east window is closed, but the open front to the south continues to provide fresh air. Mr. Keeler

is a strong believer in plenty of out-door air, especially for growing chickens. "Years ago, when I didn't know the value of fresh air, I built a tight house," said he, "and whenever I found a sick bird, full of cold with puffed eyes, I took him out and put him in an old cow shed, of which the whole south front was open. The birds usually got well in that old shed, and that is what converted me to the open-front type of houses.

"I haven't had a case of roup in five years, and then my birds brought it home from a show. I quarantined those birds for 14 days, yet was afraid to turn them out, for I was suspicious. In a few days the trouble broke out and it was lucky I still had the birds confined. Mrs. Keeler took care of those birds, and put on rubbers every time she went in the house in which they were, and took off the rubbers as soon as she came out, so as not to track the germs over the place. That is one advantage of colony houses. You can keep anything confined to one house.

"I like the colony house system, am something of a crank on fresh air for chickens, and believe in full feeding. The chickens are fed just as regularly as I eat. I rarely ever have a hen that goes light. That is nothing less than tuberculosis, and right housing, ventilation and feeding will absolutely control it.

Overcomes Fall Colds.

"A poultryman came up here last fall and asked me where were the fall colds in my young birds. I do not have any. The later chickens are put under artificial lights as the days begin to shorten in the fall. Chickens want to be fed early in the morning, and the youngsters should not go to roost early and then run over night and along into the morning with nothing more than an afternoon's feeding. That accounts for many young birds standing

still in the fall, and as their vitality runs down they are liable to catch cold."

"By putting chickens that are still growing under lights we lengthen the day and they have more time for feeding and growth.

Evening lights, will not work on young birds. So we set the lights for 4 a. m. Grain is scattered in the litter at night; dry mash in hoppers and water is before them. Those growing chickens never know that winter has come.

"It is the short day of winter that affects chickens. The cold does not bother them if they are hardened to it. Chickens will grow faster in cold weather than in hot weather, for they will consume more feed if you will make the winter nights as short as summer nights. Feeding at 4 p. m. and again at 8 a. m. means that the chickens' crops get empty along early in the cool mornings and they get chilled through as a result of lack of feed. The birds are under nourished and therefore slow to finish and easily catch cold."

While it was a dry summer, and it is always hard to get continuously rapid growth in hot, dry weather when the grass gets burned and tough, Mr. Keeler has kept his yards green by sowing them in oats. "I didn't think it was possible to get a solid mass of green in a yard 60 ft. square and keep 20 hens running in it all the time," he said. "But by scattering oats thickly on the ground and plowing them in with a five shovel cultivator, we have produced (Continued on page 896)

One of the new 10x16 ft. colony houses being built by Mr. Keeler. No. 3 Shiplap is used which costs \$30 a thousand feet. The best boards are picked out for the floor. The lumber in the sides and roof is covered with roofing paper. The material for such a house costs approximately \$30.

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

The Fall Poultry Shows Have Started

A record entry was reported by the poultry department of the Missouri Centennial Exposition and State Fair, which commemorated Missouri's one hundredth year of statehood. This event was staged the middle of August, and poultrymen were handicapped because their fowls were in old feather or molting, and their young birds were not mature. Indeed, a growing cockerel that is shipped from the range and cooped for a week in a hot summer show is often irreparably injured. Yet, Missouri, in spite of her dates, had "a record entry," to be followed at Columbus, Ohio, by the largest class of birds in the history of the Ohio State fair. The week following the Michigan State Fair was confronted with an overflow entry, the biggest in its history, and as the season advanced and the circuit reached the Indiana State Fair, the first week in September, the poultry exhibit was swelled to 1,200 more birds than were cooped on the fair grounds at Indianapolis last year.

A few of the classes at the Indiana event would have proven to be eye-openers to some of the easterners who believe that, while size may be attained in the corn fields of the west, one must not expect to see at a western September show that furnish of feather which serves to round out and complete a young male.

From Indianapolis we traveled on to Syracuse and a detailed report of the New York State Fair appears in this issue. If not always the largest in numbers, the great New York state exhibition is at least unsurpassed as a breeder's show; it is unequalled as a place to see the progressive models of the year, as they serve to indicate the tendencies of eastern fanciers; and the event serves as a get-together occasion for prominent men in the fraternity of breeders.

Here we meet exhibitors and judges whose names are household words in the purebred poultry industry. D. Lincoln Orr, J. H. Drevestadt, Maurice F. Delano, John Martin, M. L. Chapman, Theo. Hewes, Harry Lamon are there. They are not all showing, but they may be found in the poultry building talking a little, but observing, listening, thinking a lot.

The public little knows the complex problems that confront the breeder of purebred stock. His problem is not merely one of multiplication, of increase in numbers; it is a problem of bringing forth an improved generation from stock already existing. That requires skill which arises from close study and the cultivation of accurate observation and judgment.

Fine specimens from the yards of foremost breeders, well bred and well grown and properly conditioned, as they stand for inspection in the show, are always a stimulus to visiting poultrymen. The opportunity of seeing the perfection to which the breeders' work may attain is in itself a reason why the purebred business should involve considerable travel to the shows. It is doubtful if it is profitable for a fancier-breeder to be so industrious and conservation that he prefers to always remain at home, tending so closely to his own charges that he passes up a great poultry exhibition within access. It is true that he who turns out high class specimens must necessarily do much living with his birds. When he is not with them, they must still be very completely and vividly in his thoughts, for only from such concentration may "his eye become trained, and his whole being delicately adjusted to slight hints of progress, or the lack of it, in his flock." However, no breeder can afford to become a slave to routine work. He should occasionally seek the company of other breeders, and view their birds, drawing new inspiration from their best efforts. His own efforts should reward him with the leisure to do so.

Poultry shows are an inspirational and educational agency, helping a breeder to improve and increase his knowledge of breed type and color markings. For the exhibitor who wins, the show is a great means of advertisement, increasing materially the money possibilities of his stock, by introducing and securing recognition for him through the publicity that accrues to his winning. But, apart from imparting ideas and cultivating ideals, apart from the show as a means for the promotion of trade and establishment of reputation, the poultry exhibition provides a congenial meeting place—at once a place of education, business and a social gathering. This

opportunity to meet successful breeders; make note of their personalities which contribute to their genius, and ultimately to develop their acquaintance into friendship, can hardly be stressed too much.

The early fall shows, the preliminaries of 1921, forecast an outstanding and memorable year in the history of exhibitions of Standardbred poultry. We are confident that the quality and size of the classes will be not only sustained but will increase as the winter show season comes on, making the winter shows especially worthy of the attention and interest of the public and participation of breeders.

Express rates to the shows are high, but the service is good. The manhood, the personal equation that enters into the management of the great shows and into the judging of the classes, is more than good; it is worthy of full confidence and high respect.

Let us all plan to attend one or two of the best shows that will be held within our reach this winter—and exhibit our birds.

Make a Study of Your Breed

The other day we received a letter from a breeder who had started to advertise birds for sale, and who, upon receiving an inquiry from a prospective buyer asking for prices on cockerelbred and pullebred specimens, found himself in a quandary to know just what the buyer wanted; so he wrote to us to admit his unacquaintance with the terms and ask for definitions.

We were pleased to furnish this breeder such information as the limits of a letter would convey. We tried not to be impatient, although we were surprised at the speed with which this man began to do business and the tardiness with which he began to study his breed.

If a man is to build a successful business as a breeder, he certainly must know more about his own breed than the average buyer can know, and thereby have better stock than is to be found in the average flock.

A man's chickens are never better than the man; their quality never progresses beyond the upper limits of the knowledge and skill of their owner; and the breeder who does not know the history of origin and development of his variety, who does not know the characters of diverse parentage that lie hidden in the germ cells as well as the visible characters that are on parade, who does not know the breeding tendencies in his variety, is handicapped, and he will be outdistanced in the race as soon as a real student who combines thinking with working, comes along.

Again and again we are impressed with the fact that new breeders are rushing ahead without taking the first step for preparation in the fundamental principles of breeding, with the result that they drift along for a few years, bolstered up by the purchases they make, and then becoming disappointed with the uncertainty of their progress, they at last dig down into the technical literature that is available on the subject of breeds and breeding.

We may here well cite an instance of a breeder who has at last realized that he must really begin to breed chickens. This party has been a rather successful exhibitor in his variety because of a deep purse. But last year as he stood in the aisles of the show at which he has been a successful exhibitor for some seasons, he remarked to a friend: "These fellows who are showing against me are gradually and steadily coming up on me. They have knocked me out of a couple of firsts at this show. And the devil of it is they have not only a uniformity which I haven't, but they know how their bloomin' birds are bred, and can reproduce them! I can't go out and buy birds to meet such competition as they will give me in a year or two more—and I have got to start now to give this breeding problem a whole lot more thought than I have ever given it before."

Some noteworthy birds have come from chance matings, as the history of all stock breeding proves, but the constructive work that builds a line which wins the coveted prizes for its owner and breeds on, is done by well informed, yet practical men who know the base on which their breed rests, who know the progress and errors of the past, who know the tendencies in their variety.

Few people realize the complex factors that enter into the problems of heredity and transmission. The practical breeder must know what he is doing, and why. It is no longer necessary to work by guess, and it is a mistake to waste time through a lack of information in regard to the principles that underlie successful breeding practice.

Give enough basic information to the man who is liberally endowed with the power for observation and the patience to await results, and you will make a good breeder.

To Teach Breed Type

As a visitor walks through a poultry show he cannot fail to be impressed by the different shapes, sizes and colors of the different breeds. He may not grasp the significance of the particular characters that are fastened to each breed, but he does realize that there is not a sameness about all the fowls, for the members of each breed are set apart from one another by distinct breed characteristics.

The breeders of poultry have done a marvelous piece of work in developing the breeds and varieties and bringing them to their present high state of perfection. Like all men who have made a contribution to the world, they have felt that they deserved some credit, some public applause. That homage and appreciation has been theirs for many years is forcibly demonstrated by the way purebred poultry has increased in numbers as well as by the expanding public interest which has carried purebred fowls to all parts of the country. Of late, however, signs have multiplied to indicate that the work of poultry breeders is to be elevated to a still higher plane in public estimation through the teaching of agricultural colleges. These institutions of learning, supported by state and government, wield a great power in shaping public opinion, and it would be difficult to foresee the ultimate scope and possible influence of their work in the future. It is, therefore, a matter of more than passing moment when they evince interest in and sympathy with the constructive work of the practical fancier-breeder.

The first letter to draw our attention to the interest of leading educators in the ideas and ideals of fancier-breeders came from Dr. A. J. Brundage, leader of the Boys' and Girls' clubs in the state of Connecticut. This work is carried on in connection with the Connecticut Agricultural College and in co-operation with the U. S. Department of Agriculture. Dr. Brundage wrote under date of July 21:

"We have been attempting during the last two years to give our poultry club members some worthwhile work on poultry judging. Personally I feel that it is very much worth while and I am desirous of organizing our work in such a way that they will receive a more definite type of instruction.

"In order that we may plan our poultry club work more intelligently we are desirous of knowing, if possible, how poultry judges gained their training in this art."

We feel that it is well worth while to teach poultry club members to estimate the value of a specimen on the basis of its Standard quality, thus inculcating the fundamentals of breed type.

Progress in all kinds of live stock has been made along the lines of recognizing, developing, and emphasizing particular type and breed character. When judging is put on a basis of selecting hens by faded shanks and late molting, it has as much or more to do with feeding and management as it has to do with breed qualities.

That breed type must be maintained is not merely the opinion but the experience of a rapidly increasing number of poultry raisers. At one of the agricultural colleges, the egg yield of a family of White Plymouth Rocks has gone up, but size has gone down, and the growing qualities of the chicks are not as good as they should be. It is the law of compensation that for everything you gain you lose something else. This is a practical condition which confronts the poultry raiser, and leaders are voicing the need of an understanding and appreciation of breed proportion and balanced breeding, rather than a specialization in one quality to the point of sacrifice in other qualities.

Under the date of September 6, LeRoy L. Jones of the Indiana College of Agriculture, wrote that the third annual meeting of the reorganized Indiana State Poultry Association

would be held at Purdue University, October 4, 5, and 6. Mr. Jones then added:

"Thursday afternoon we want to turn over to the poultry breeders and the one vital message needed by many who will be present, is that Standard requirements must not be forgotten in the mad scramble for high production."

The New Jersey Agricultural College, where the poultry work is under the direction of Prof. Willard C. Thompson, is giving both the four year students and the winter short-course students instructional work with special reference to types and breeds. Prof. George W. Hervey, who will teach this course, writes the following comprehensive statement:

"Every student at the outset is made familiar with the breeds. In the elementary course they are required to memorize the Standard classifications, including all varieties. Breed types are explained by diagrams and by variety recognition practicums on the station farms and in the laboratory.

"College students who specialize, as well as the short course students, learn the various breed types in their judging work. They are given instruction in using the Standard. Judging practicums on all of the common varieties are held. The students place the birds in each class and are required to write reasons for their placing. Instruction is also given in washing and preparing birds for the show room. This work is supplemented from time to time by trips to farms of New Jersey breeders. This instruction in the breeds, in the short course, culminates in the annual student poultry show. Every student prepares and exhibits a pen of birds and prizes are awarded to the winning exhibitors.

"In teaching the types and breeds it is thought that some knowledge of the history of the breed should be imparted, as well as comparisons of their different utility characteristics.

"From what I have written previously you will gather that major attention is not given to types and breeds. All phases of the work are given equal attention but before any student is taught anything else, he must learn the Standard and utility characteristics of at least the common breeds, together with

their development, without which, he cannot be an intelligent poultryman."

To make intelligent poultrymen—men of balanced judgment—is the highest aim of the teacher of poultry husbandry. Men who receive such instruction are better equipped to become leaders in practical poultry work; not merely feeders of poultry, but breeders of improved stock.

Three Silver Cups.

A large silver cup, to be known as the President Harding cup, will be awarded at the forthcoming Capital Poultry Show in Washington, D. C.

Another beautiful silver trophy is to be known as the Vice-President Coolidge cup; while a third equally elegant cup is to be offered in the name of The Honorable, the Secretary of Agriculture, Henry C. Wallace.

The President's cup is to be awarded on the best cockerel in the American class. The Vice-President's cup is to be awarded on the best pullet in the American class. The Secretary of Agriculture's cup is to be awarded on the best young pen in the American class.

In a statement of why these momentous specials have been placed on the American class, Jos. Wm. Kinghorne, Asst. Secretary of the Washington show says: "The officers and directors of the Washington Show believe that it is possible not only to combine utility with show qualities, but they equally believe that this combination has been perfected best in the birds of the American class."

Elisha Hanson, President of the Washington Poultry show, commented on the cups as follows: "It is a signal honor to poultry breeders, when the leaders in our national life, the President and Vice-President of the United States and the Secretary of the United States Department of Agriculture, allow us to offer these cups in their names in recognition of the construc-

tive work of the improvers of our established breeds of fowls. It is fitting that these men should specify that the cups should be placed on the American classes, so as to encourage the further advancement of those great breeds which were originated in America by the genius of American breeders. One thing more, these are breeders' cups. I know that some will feel that the cups should be awarded to the best birds, regardless, but we shall require the winners to make affidavit that they are not only the owners, but the breeders of their birds. The cups are not a part of 'the exhibition game.' They are to be awarded to actual breeders in recognition of breeding effort and progress in breeding. It is with the desire on the part of the high officials of our Government to recognize the work of the improvers of our domesticated races of live stock, that the cups are given.

"These trophies, like other great cups, such as the Davis Tennis Bowl, America's Cup, and the Harmsworth Trophy, will be kept in competition year after year, and a certificate of winning will be given to the fortunate breeder who is awarded the judges' decision at each show. In the event that any one breeder is successful on three different occasions, a duplicate of the trophy which he has won will be given him. I feel that these cups will go down into history, and that their winning will become more important with each passing year. As often as possible, we shall hope that the President, Vice-President and Secretary of Agriculture of the United States may personally present the cup to the winner of the year—and always the occasion will be in honor of the breeder of the year."

Such recognition of poultry breeding by high officials in American public life, should be happy news to poultry breeders, and make us, one and all, proud to be engaged in so honorable and worthy a pursuit.

CANADIAN LAYING RECORD

Made By

REGAL DORCAS WHITE WYANDOTTES

In the Hands of Thos. Lund, Esq., Stonewall, Man.

"REGAL SENSATION 1st"
Madison Square Garden, 1919

At the Manitoba Laying Contest, held under Government supervision and ending October 31, 1920, a pen of 10 White Wyandotte pullets sired by Regal Dorcas males direct from my farm made the splendid record of 1824 eggs, winning Second Prize in the Manitoba Contest, First Prize for heavy breeds and the same for all Canada as the records made in Manitoba were higher than those made in any of the six other Canadian Contests. This is only one of many records made by customers all over America and simply goes to show that while the Regals have been making their wonderful show room record, the utility qualities have kept pace and today they are universally known as the best all round fowl in existence. DO NOT HESITATE. Pin your faith to the Regals and be successful.

125 ACRES DEVOTED TO WHITE WYANDOTTES

5000—Cocks, Hens, Cockerels and Pullets for Sale—5000

FREE—Send for 20 page Catalog and Fall Bulletin telling all about my present offerings. Send 10c for a copy of the Regal White Wyandotte Book. The information it contains will be of the greatest value to you.

John S. Martin,

Box 51,

Port Dover, Ont., Canada

CURRENT NOTES AND COMMENT

A Broad Policy.

The Pittsburgh show last year paid first prize money even though there was only one entry in the class. The plan proved satisfactory and Pittsburgh will again pay first prize money whether there is one bird or a hundred in the class. This gives the odd variety exhibitor a chance to get in the prize money. It results in a better balanced show, and its continuation will result in filling the odd variety classes.

This broad policy on the part of the Pittsburgh Association raises the question of whether excellent varieties and deserving breeders are being crowded back by exploiting methods of some show managements. That matter is worth considering. At any rate, it should be pointed out that a show which extends a helping hand to all breeds and breeders is worthy not only of the highest commendation but of the entries and material support of exhibitors.

Contrast to this broad and liberal policy of the Pittsburgh Association, the announcement that local poultry show Associations shall be asked to pay \$10 to \$100 for A. P. A. patronage, which patronage consists primarily of medals and diplomas to be awarded to the best birds owned by A. P. A. members. The best bird in the show cannot win one of these special prizes unless its owner is a member of the A. P. A.

The A. P. A. might very properly be asked to pay \$10 to \$100 for offering such bait to get new members. No poultry show association would think of paying a fee to specialty clubs to get them to offer special prize ribbons to their members. Why pay a fee to have medals and diplomas awarded to members?

The A. P. A. should foster all breeds and varieties which it has recognized, and encourage the production of more birds which approach the Standard ideals it has set. It should not seek to commercialize the shows.

Commercialism will ruin any sport as well as debase the sportsmen. Take baseball, only a few years ago it was lauded as the great national pastime. The Chicago Tribune printed 4 to 6 columns of reading matter a day on professional baseball. Today it gives the shears to what it now terms "commercialized baseball," and prints a half column. The New York Mail endorses the attitude of the Chicago paper.

Amateur sport, clean, wholesome competition, a fair field and no favors are what the high minded, stout hearted, average American wants. Those interests that are set on commercializing everything they have to offer had better check up before the interested public liquidates for them.

* * *

First Prize Birds or Nothing.

A prospective buyer wrote an old established breeder and asked for his price on a cockerel guaranteed to win first at Chicago. The breeder quoted a price but specified that the bird was not guaranteed to win either first or fifth. Because of the established and generally recognized quality of the breeder's line, the buyer purchased the male; he won 1st, and afterwards wrote the seller to commend him as "an honest man." In commenting on the incident, the seller remarked: "I would have been just as honest if the bird had not won first."

Sellers are often up against rather arbitrary demands which are proposed by prospective customers as requirements that must be agreed to before a sale can be negotiated as indicated by the following exchange of letters between buyer and seller, which is a kind of preliminary correspondence based on

HILLVIEW STRAIN STANDS SUPREME and they are America's Foremost Line-bred S. C. WHITE LEGHORNS A REPUTATION WON ON QUALITY

Have made amazing records in Egg Laying Contests of National Fame—and record winnings in America's largest Show Rooms. The impressive winnings of Hillview Leghorns of almost every ribbon at the Chicago Coliseum Show of 1918, 1919, 1920, and the winning of first prize Pen in Missouri and American Egg Laying Contests, is still an unbroken record.

Guaranteed Winners for Any Show in the Country

No matter where you want to show, we have the birds that will win for you regardless of competition. The winning of Hillview birds in the hands of hundreds of customers for the past eight seasons, is your best assurance that Hillview Quality will win anywhere.

Send for our Bulletin No. 61, it is full of bargains in breeding stock. Catalog free.

**MAKES
BIG HIT
WITH
POULTRY
RAISERS**

BUYING FEEDS

The ever increasing popularity of our "direct from mill to user" plan of buying poultry feeds is proof not only of its many saving advantages but also of the fact that, poultry raisers have found Basic Feeds to be exactly what we claim for them, namely—**100% Quality Feeds.**

When such successful men as P. C. Sciarra, Hillview Farms; G. S. Beyers, Hazelrigg, Indiana; F. L. Brace, Medina, N. Y.; Fred Warren, Mt. Ephraim, N. J.; E. D. Taylor, Kalamazoo, Mich.; and hundreds of other prominent poultrymen in all parts of the country tell us that Basic Feeds and our "direct from mill" plan of selling is one of the big factors of their successes, it is pretty good evidence that you will find our feeds and our money saving plan more than satisfactory.

BASIC FEEDS

FOR POULTRY

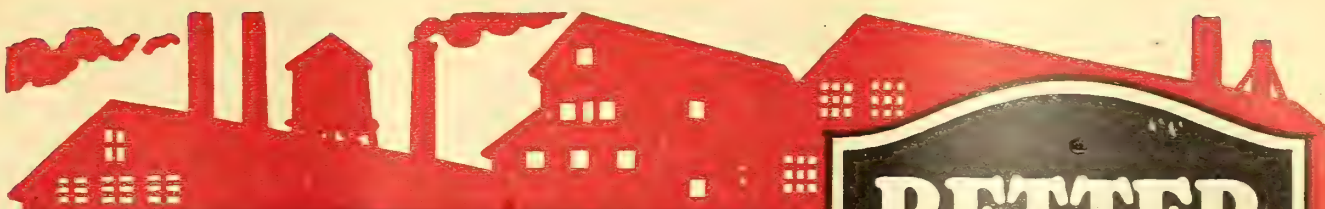

The reason Basic Feeds produce such wonderful results for poultry raisers is because they are composed of the best feeding stuffs the market affords. There is nothing

added to make bulk nor to cheapen the product so it can be sold at a price. We simply put into the feed choicest Basic Feeds, properly milled, blended and balanced according to formulas that have proven by various tests to be best for the purpose intended. The only reason Basic Feeds cost less is because we sell "direct from mill to user." The combined profits of middlemen, the heavy expense of traveling salesmen, are entirely eliminated. The retail dealer's selling expense, overhead and profit, while adding enormously to the cost of your poultry feed, do not add one cent's worth to its value. This retail selling expense and profit must be included in the retail price *you* pay for any feed or the quality must be reduced while the price remains the same.

Our plan of selling "direct from mill to user" enables us to save you this added expense and we are able to give you the finest quality feed that human skill and science produce at prices considerably less than feeds bought in the regular way.

BASIC FEEDS CO.

DIRECT FROM MILL

BETTER FEEDS FOR LESS MONEY

In the Basic Feeds line will be found every feed necessary for poultry from the day old chick to the matured fowl. The formulas used in our various feeds are standard. They are the result of many years' experience and extensive tests made by leading poultry experts. They have proven to be the best combinations of feeding stuffs that have ever been made for poultry of all ages. We maintain the formulas and high quality of the ingredients all the time—never changing or sacrificing the quality to meet a price. We would, just at this time, call particular attention of poultry keepers to our Laying Mash. As an egg producer it is unexcelled. Poultrymen who begin now to feed Basic Feeds Laying Mash will find that their young pullets and laying hens will produce eggs this fall and winter in greater quantities than they ever dreamed possible. This is because our Laying Mash is composed of just the proper ingredients to produce eggs. Keep it before your fowls where they have free access to it all the time, and you will be agreeably surprised at the eggs your flock produces.

Write for FREE Sample Descriptive Folder and Price List

Fill out and mail coupon in this advertisement—send it to us and we will send you free sample of Basic Feeds, in order that you may note its superior quality and texture as compared with other feeds on the market costing equally as much or more. We will also send you free and postpaid our catalog folder, describing the complete line of Basic Feeds and with it our money saving "direct from mill" price list.

If you are interested in securing the best possible results from your poultry—if you are interested in securing the best poultry feeds the market affords at prices exceedingly low, when considering the results they produce, then you owe it to yourself to fill out and mail the coupon and get our descriptive folder and free sample. Get the facts about poultry feeds—decide *now, today* to join the thousands of poultry raisers who are saving money by buying their feeds direct from our mill. Mail the Coupon.

*"I am just
writing the
news of
my great
70
Annual
Sale"*

Here it is, late Summer—and I am coming to the close of my biggest and best season. Undoubtedly the tremendous demand this Summer for "Famous" Anconas was accelerated by my phenomenal success at Madison Square Garden early in the year when I recorded the fourteenth great consecutive winning by capturing TEN FIRSTS from a possible twelve.

I consider that the "Famous" Anconas I have to close out at the special prices are even better than during former years—but I haven't so many of them. First come—first served.

It is good, sound advice to suggest that you write immediately for the Special 70 Sale circular—which will be ready for the mails by the time I have your letter—and post yourself on the very special prices offered on "Famous" Anconas.

Whether you are interested in Anconas from the standpoint of prolific egg production, the astounding beauty of the strain, or their amazing performance at the shows, get my special sale circular at once.

H. Cecil Sheppard

Box 387
BEREA, OHIO

the desire of the buyer to purchase first prize birds or nothing.

A prospective purchaser writes:

"Yours of the 24th, inst., received.

"I am willing to pay your price for the pen mentioned if they take the first prize at ———. My proposition is just this: If they take first prize at ——— I will pay you \$125.00 for the pen; then if they do not I may return the pen to you and have my money refunded. This is the only way I will purchase the pen. Possibly this will not suit you, but unless I can get the first prize at ——— with the best young ——— pen I do not care to purchase. If you will accept my proposition notify me at once so that I can make my entry and will mail check to you by return mail.

"Hoping to hear from you at an early date,
I am, Yours very truly,

The seller in acknowledging and answering this valued communication replied convincingly and forcibly as follows:

"I have your interesting but exceptional proposition to pay me \$125.00 for a young pen of ——— that will win first at ——— subject to return and refund of your money in case they miss first money.

"Let me analyze that idea on your part. Inasmuch as you are a public official, let us suppose you are nominated for City Collector of your city. The election date approaches and the Election Fund Committee solicits your quota. You tell them you will give \$100 with the understanding that you must receive a refund of the \$100 if you lose the election. ——— comment unnecessary.

"Again. Suppose you are in the hardware business and carry the finest British and American rifles. I am a moose hunter and I say to you: I am going to Canada again on a moose hunt and need a real rifle like this one. You advise that the price is \$125.00 adding that this is the universal price and nobody questions the value. I say, yes, I understand the worth, value and perfection of this gun but I want you to make an exception in my case and sell me the rifle at \$125 under these conditions only: I'll pay you \$125 now with the distinct understanding and your guarantee that I get the game I want on this hunt, regardless of my ability as a marksman, regardless of the supply of game, regardless of whether the train runs off the track, regardless of how much I wear the gun, etc., that you are to absolutely assume all responsibility in view of the above and refund every dollar of my money when I hand you back the gun and a statement that I failed to get the game I wanted.

"In the name of business ethics, business prudence, sportsmanship and sensible business reasoning, what would you think of me?

"Your proposition means that I would loan you the birds for a consideration; that the birds are mine and shown under a false name until they win first, and thereafter under a false name if they should be placed below first ——— a specific violation of fair rules as well as a specific violation of the American Poultry Association rules.

"The quality of this pen which I am offering you, is distinctly superior and their ability to make good as first money winners carries no doubt in my mind, and I am not guessing when I put an outstanding exhibition pen together; and be assured that I have them. Come up and I'll show you.

"If you are a business man, and our positions were reversed, your attitude would be precisely the same as mine in these premises. Otherwise you would either quit business or bust.

"Last fall I sold ——— birds that won firsts and will exceed that record this fall. Two or three of those customers proposed the same terms you propose. They were, of course, turned down. But they bought and won. So will you if you purchase.

"Yours very truly,

This argument of the seller is so fair, so logical, that it appealed to the common sense and business acumen of the buyer, and he

purchased the pen, securing excellent value for the money he paid.

* * *

Plan to Issue Club Standard.

A. F. Rolf wide-awake and progressive secretary of the National S. C. White Leghorn Club, writes:

"Was interested in your editorial relative to the Standard of Perfection, and its field of usefulness.

"I note the suggestion of President Rigg to sell the Specialty Clubs the privilege of publishing their variety standard at 50 cents per copy, but even that will not allow the Standard to serve its greatest purpose.

"You know, as well as I know, that the Single Comb White Leghorn is suffering untold injury today on account of a lack of knowledge of what constitutes a White Leghorn, and the consequent ease with which 'salesmen' are able to put over almost any white chicken.

"It has, for some time, been my purpose to plead with the members of this club, at the next annual meeting, to allow me to spend all available club funds during the ensuing year, and to devise ways and means of increasing such funds, on a single project, namely, to print the Standard for White Leghorns for free distribution among each and every interested person with whom we can get in touch.

"I realize that the American Standard of Perfection is protected by copyright. But, that doesn't worry me in the least. With the talent represented in the membership of his club, we can prepare a club Standard which will not infringe upon the A. P. A. copyright, and yet which will serve as a complete substitute for the A. P. A. Standard. In other words, all of the present Standard requirements can be presented, in sufficiently different form to avoid copyright infringement, and at the same time the presentation will accurately depict the Standard Leghorn.

"It is my hope to go even further than the present A. P. A. Standard, in that some explanatory matter will be inserted to clear up points which bother many beginners.

"But—the chief point that I want to make is that if the members of this club will support my plea (and they have not refused a single request yet) I shall make the chief project work of this club during the next year the preparation, and the widest possible distribution of a Standard of Excellence of the White Leghorn, and, such distribution will be absolutely free.

"It is my belief that such a distribution, and the consequent realization of what it takes to justify the application of the name White Leghorn to a bird, will serve as the common ground upon which we may later attempt to harmonize the various 'types' or forms of 'White Leghorns' with which we are at present afflicted.

"What do you think of such a move?"

If a man is a breeder of Holstein cattle, or is a beginner just becoming interested in Holsteins, he can write to the secretary of the Holstein-Friesian breed association and secure a standard and score card for males and females, free of charge. He can also secure gratis a number of pamphlets and booklets on Holstein cattle and Holstein milk. The Holstein-Friesian association is interested in breed expansion—in wider popularity for their breed, and more business for their breeders. Their revenue will come when new breeders register their purebred cattle.

The American Poultry Association receives no registration or transfer fees. Its one monopoly on revenue is the Standard.

When specialty clubs issue their own standards there will be danger of specialists carrying their hobbies too far. There will be danger of the Brown Leghorn Club having a different scale of points for Brown Leghorns than the White Leghorn Club has for White Leghorns, with confusion resulting, for general judges, rather than specialist judges, will always place the awards in the average show.

However, the needs of the times require that Standard ideals, which govern judges and breeders, shall be given wider distribution. The problem is one which should receive the

\$100.00 Extra Profit from 100 Hens

ONE dollar extra per hen per year, is the record of poultrymen who keep hens under electric light a few hours in the winter mornings and evenings.

Delco-Light provides the means for lighting poultry houses at little cost. An inexpensive automatic switch turns the light on and off at the right time.

Think of the extra profit Delco-Light will earn. More eggs in the winter when prices are high! And this same Delco-Light plant will furnish light for the house, the barn, and the farm yard. It will furnish the power to do the chores and pay for itself in a short time.

Mail Coupon for Booklet.

WE have prepared a booklet on the lighting of poultry houses. It is called, "The Miracle of More Eggs." It contains the reports of experiments of Cornell University, Washington State Agricultural College, and some of the largest poultry raisers in the country. It explains in detail how and when the hen houses should be lighted to secure the best results.

A copy of this booklet will be mailed to you without cost or obligation. Simply sign and mail the coupon.

serious consideration of the Standard Revision Committee.

Secretary Rolf voices the needs and gives expression to the visions of his club. He represents a reorganized organization of White Leghorn breeders. New life has been injected into the White Leghorn Club, and it is determined to get out of the rut. If it could have gotten out of the rut twenty years ago there would be more Standard White Leghorns on commercial egg farms today. Unfortunately many men who took up White Leghorns had no easy means of learning what constituted a high class specimen.

* * *

The Ground Color.

In the early days the breeders tried to cover up defects. They had mossiness in the centers of their laced varieties, so they bred the white center very small and the black edging very wide to close and cover up the defective open center, and likewise they bred the penciling in their Dark Brahmas so close as to almost cover the ground color.

That covered but it did not purify. The great progress of the last quarter century has been in cleaning up; not covering and continuing to breed a latent defect; but coming out into the open with the defects eliminated.

In Barred Plymouth Rocks, breeders have quit trying to secure greater snappiness of barring by darkening the dark bar; they have secured the stronger contrast between the bars by clearing up the light bar. E. B. Thompson has remarked "I don't know as we want the white bar as white as a white collar, but that is the end to aim for." In the matter of undercolor, the term "undercolor" is no longer in common usage among leading breeders of Barred Plymouth Rocks. A bird may have a strong undercolor because the white bar is slaty and not clean. They, therefore, speak of underbarring.

Twenty years ago Ezra Cornell spoke of silver penciled color as a contrast of black on white. In this issue of the Journal Rev. Harwood tells of a wonderful female shown at Boston that was an undefeated champion, and the secret of her color was the cleanness of the white ground on which the black bands were laid.

The Standard calls for a grayish white light bar in the Barred Rock even to this day. Nobody wants such a light bar. All modern breeders want a clear, clean light bar that approaches white, and they want the black bar to stop abruptly and not run into the white.

Rev. Harwood raises the question of whether breeders of Silver Pencils should actually want a gray ground color. This is the expected thing in pullets, but as hens, the penciling and tone of the color improves, and is not the white ground color, the end to aim for? We may never completely get it but we can get it as well as nature will permit.

The first Standard of Excellence in 1874 called for a "grayish white" ground color in the Dark Brahma. This was changed to "gray" in 1898. We believe that the tendency should be toward a cleaner ground color. The black penciling to stand out in sharp contrast, should lay against a nearly white ground. Ezra Cornell pointed this out twenty years ago. We are turning back to read again, and with new understanding, what he saw and understood so clearly at that time.

* * *

Birds that Will Breed Color.

A fancier who read the article on Silver Penciled Wyandottes which appeared in last month's issue of the Journal, remarked: "They are a beautiful fowl, but are certainly hard to breed."

A breeder of the variety remarked: "Why did you recommend double mating?" That is the issue. Double mating always seems to put a damper on the discussion of a breed. It even discourages many new men from ever hoping to master the intricacies of the successful breeding of the variety.

We suggested a line of double mating for two reasons. First, because of the mediocre quality of Silver Pencils that is being shown

by the average exhibitor. Second, because it is the easy way to breed good quality.

It is more difficult to breed both good males and good females from one mating than it is to say: since freeing both good males and good females is a compound problem, I shall break the problem into its two component parts. The females from my fine male I shall learn to admire and value for their ancestry, their pedigree, their breeding possibilities as producers of fine males. The cockerels that I mate for the production of my exhibition pullets will be from sharply penciled, clear colored females; he shall be a cockerel that was well penciled when in his first chick plumage, and I shall value and breed him regardless of his light undercolor and the occasional white ticking on his breast.

That method is complex in theory, but it is simple in practice. It is the easy way to breed. It accounts for many successful exhibitors being double maters. They have split their problem in two and have then solved each simple part. They are not better breeders than the single maters, but their problem is easier and so they go ahead faster.

Consider apart from actual practice, we do not believe in the theory of double mating. It is merely an expedient to help breeders over the hill. The truly great breeders will always be single maters; the men, like Geo. W. Mitchell, who produce their 1st prize cockerel and 1st prize pullet from the same pair. But, such men are unusual. The majority of breeders never get very far above the average unless they simplify their problems.

* * *

The East Is Not Forgotten.

On Sept. 6 President Rigg telegraphed us: "Have appointed Henry P. Schwab member of Standard Revision Committee." Public opinion will approve this appointment. It was little short of ridiculous for the Seattle convention to approve a Standard Revision Committee that did not include a single man who is prominent as a judge or breeder at the great eastern shows. The only eastern member, Mr. Schwab, was dropped. Was it any wonder that easterners began talking about the "westernizing of the A. P. A."

* * *

Breed Articles.

We are in receipt of an article on Selecting and Breeding Buff Wyandottes by Henry Trafford, and an article on Rose Comb White Leghorns by J. M. Chase. We are pleased to acknowledge these articles. We feel that they will be read with interest by readers of American Poultry Journal and that their publication will develop still more interest in the breeds discussed.

For several years there has been a shortage of breed articles. The new men in purebred poultry have not been favored with the valuable articles on origin, history of development, mating and selection of the different varieties such as beginners enjoyed in those older days when the poultry press was illuminated with such articles. It is indeed gratifying to note the resumption of writing by breeders. The plainest and simplest truths that they have to tell about their breeds and breeding operations are highly helpful to readers.

As an illustration of this kind of articles we have in mind particularly the article in our September issue on Buff Leghorn type which was written by D. E. Roberts. It was a short article and had one illustration. We would welcome other articles of that kind, and the cut necessary to illustrate the article will be made at our expense when photograph is furnished.

W. S. Crandell also contributed a breed article to the September issue which reflected to its author's credit. Too many such articles have been reserved for publication in club year books, which seldom have a circulation exceeding two thousand. We are glad to open up a large public forum for breed articles, by furnishing the white paper, printer's ink and circulation.

All we ask is your co-operation, Mr. Breeder, and we will do our part to make more and better breeders of purebred poultry. We shall be pleased to hear from you about your breed.

Purina Lowers Egg-Making Cost

Produce more eggs! That is the sure way to cut egg cost and increase profits. Every farsighted egg producer knows that the best way to get more eggs this winter is to prepare now by feeding for more eggs.

Purina Produces More Eggs

—because it supplies all needed material to make eggs. Purina Chicken Chowder contains an excess of white-making material, and Purina Hen Chow contains an excess of yolk-making material. By feeding them both, the hen receives a perfectly balanced ration, and you get every egg your hens are capable of producing.

Money-Back Guarantee

The money paid for both Chows will be refunded if hens when fed Purina Chicken Chowder and Purina Hen Chow as directed, do not lay more eggs than when fed any other ration. Catch the vision—"greater winter egg production at lower cost." See your dealer or write

(Continued from page 885)

a fine crop of sprouted oats. The grains that do not get covered up are eaten by the hens, so there is nothing lost. It has been necessary to replant the oats every three weeks in dry, hot weather, for the sprouts dry, or at least get tough. After September we sow rye instead of oats.

"It is hard to get fertility in September. Southern breeders buy some eggs in the fall and from hens running in the green yards I have eggs running about 80 per cent. Of 220 eggs I now have in the machine, 179 of them are fertile. That is 81 per cent. And at this season of the year I have only one male in each yard of twenty females.

"I do not take any stock in this talk of poor fertility in the breed. Last year a fancier of White Wyandottes told me that he had been breeding the variety for twenty years and had never been able to get what he wanted. He said that he had never succeeded in getting a male that had the right width of back in front of the tail. I told him that I could supply that kind of a bird at \$35. He bought the cock, a yearling, mated him to eight hens, hatched 208 chicks this spring and had 203 of them when I heard from him three weeks ago. I could cite case after case of 90 to 100 per cent hatches but that is too tedious.

Correct Type in Males.

"I want a White Wyandotte to be just as wide across his saddle at the base of his tail as he is at his shoulders. A bird with a naturally broad back will have a naturally well spread tail. I want the tail well covered with lesser sickles and tail coverts, and I want these feathers that cover the tail to be broad, to have good width. I want the tail to be carried high enough and covered well enough to carry out the rounded lines of the typical Wyandotte. There must absolutely be no break at the juncture of back and tail. I wouldn't have a bird on the place that had a break in front of the tail. I do hate that.

"As for the other end of the bird I want a thick neck. I detest a long, slim neck. I am very particular about the neck. A good coach horse neck, well arched, becomes a Wyandotte male.

"A long necked male always stands high in front. I want a full, round breast when the bird is viewed from the side and a broad breast when the bird is viewed from the front. You want to keep away from a V-shaped or wedge-shaped breast. The breast must be rounded. Strange to say, a great many birds that are good in back and tail are deficient in breast.

"A great many beginners only see the top line of a male, the line over neck, back and tail. But there are other considerations.

"Now take my first cock at the last Chicago National Show. Let us put a cross on the center of his wing bow and notice how well balanced he is all over from that point. This cross is practically in the center of the bird. There is good distance from the cross to front of breast. Males that have no development in front of wing bows are the pointed breasted fellows. There is nothing to them.

"Notice the depth of body from the cross to the legs. I want the legs in the middle of the chicken, not set too far back or too far forward. I want the fluff to be abundant but not the long, loose, profuse feathering of the old-time Cochins.

"The underline of the wing should be horizontal. The bird that holds the points of his wing down is a bird that stands up high in front and has a wedge shaped, deficient breast. In order to get the wings held up in good style the bird must have broad, square shoulders, and be flat across the back at shoulders.

"In the matter of length, I absolutely do not want too short of bird. If you dress one of my chickens its carcass is as long as a White Rock, but because of the different style of feathering, the living birds look broader, deeper, rounder and shorter.

"Crowning the bird is the typical Wyandotte head. A round, broad headed bird is the strong, vigorous bird. In young chickens the head and comb show up first and it is

Measuring White Wyandotte body proportions as explained in the accompanying article.

natural for beginners to attach a great deal of importance to these features. I place comb fifth. First is shape; second, size; third, color; fourth, a good red eye; fifth, comb.

"I want a good, big bird, but not too big. I used to like a 10 pound bird, but my choice is a cockerel that will weigh eight pounds, when in good flesh and fully matured. A bird that is too large is clumsy and usually does not prove to be a good fertilizer, and a hen that is too big is usually not a good layer. I prefer 6½ to 7 pound hens.

"The general conformation of the female should correspond in an effeminate way with that of the male. Let me tell you the female is more important than the male in breeding shape. A great many beginners fall down in not picking females with the right breadth of back and spread of tail and depth of body. A female lacking in these essential points is not much of a breeding bird. I always watch carefully the young pullets which broaden out and fill up in front. These birds always have great breadth and depth of body throughout life.

Color of the Variety.

"There are three kinds of feathers on a White Wyandotte. Some birds produce feathers that break, unfold or spread out from the pin feather, showing a chalk whiteness at the very outset. This kind of feather will mature white, but later when exposed to air, rain and sun, which apparently dry out the oil in it, it becomes brassy. True, all such birds do not become brassy, but those that do not are the exception and not the rule.

"Some birds have feathers which when they break and unfold, show a pinkish-white color. This kind of feather will turn brilliant white and will stay white after the oil has entirely dried out of the feather. Nevertheless I never like to use too many birds of this color, for the reason that as cocks and hens, the leg and toe color as well as color of beak, will fade almost entirely away.

"The bird whose feathers come out of the horny covering, or pin feather, and show creamy will continue to bleach out as the air and weather dry the sap and oil, until finally the plumage is a bright snow white. This kind of feather will never grow brassy and this is the kind of birds, especially females, used by me in my breeding pens. They not only become white but they stay white and they breed white; in fact, they are the only kind I have ever found that will breed genuine stay-white birds with yellow shanks.

"I used to find that one drawback to this creamy color was the difficulty of getting a pullet ready for an early show as her coat of plumage as a rule had not matured sufficiently so that the oil or sap had dried out of it and it had become clear white. Now, I feed differently. I give the young birds yellow pigment feeds, such as yellow corn, gluten feed, etc., which establishes the rich yellow leg and beak color; and after the pullets are four months old, at which time

Lay
\$100

The **COLLINS AUTOMATIC FEEDER and EXERCISER** supplies scratch-feed as needed. Keeps hens properly fed whether you're home or away. An absolute necessity to the side line poultry keeper. Simple—strongly built—always on the job. Prevents waste of feed—rat and sparrow proof—saves labor. Hens must exercise to lay—this keeps them busy—increases the egg-yield. Complete, with 8-quart feed bag—\$1.00 delivered. Feeder alone—without bag—75c delivered. Attach to bottom of grain bag, pail, keg, box or old trouser leg and you have a perfect feeder at practically no cost.

When buying sprouters or feeders from your dealer demand the **COLLINS**. Or order direct from this ad. We will ship immediately, with full directions. Don't delay—make your hens lay *now*—no risk under our guarantee. Use the goods 10 days—then get your money back if you want it.

White Feather Egg Farm

You'll Make Most Money With A Wishbone!

You save money when you buy it! You save space when you install it! You save an unbelievable amount of labor and fuel when you run it! That's why Wishbone operators made most profits last season—and will make most profits next season.

The Wishbone gives you the greatest capacity. It will hatch more chicks for you in any given space.

The Wishbone uses less fuel than any incubator made. The Wishbone Heater cuts your fuel bill in half. Burns coal, or gas, or oil.

The Wishbone requires less labor and less attention. Turning device enables you to turn 100,000 eggs in two minutes. Ventilating system keeps each compartment absolutely right and automatically cools the eggs. You put in the eggs and you never touch them until the eggs are hatched.

The Wishbone hatches the greatest percentage of *livable chicks* with the least cost in the least space with the least labor. The Wishbone absolutely costs less per egg capacity than any other incubator on the market.

Wishbone prices have been reduced to rock-bottom. Increased volume and lower cost of materials have enabled us to lower prices to hard pan.

Send for our new 1921-1922 catalog which explains in detail the many exclusive patented devices of the Wishbone and the scientific principles behind them. Write today for your copy.

Kerlins' Grand View Poultry Farm

Arthur E. Kerlin, Owner

Dept. 3 Center Hall, Penn., U. S. A.

Oat Sprouter \$2.49

This home-made oat sprouter was made in one evening by a 14-year old boy with no tools but saw and hammer. The total cost, including stove for heating, was \$2.49. Thousands of these sprouters have been made at home by poultry keepers, and hundreds of letters in my files testify that it is the cheapest to make, the easiest to operate, and the handiest and best sprouter ever built.

Make Layers Out of Loafers

To make hens lay abundantly in winter you must feed growing green food that is rich in vitamins. Sprouted oats furnish the best of such food at lowest cost.

The Putnam Home-Made Oat Sprouter will supply better and sweeter sprouted oats with less fuss and dirt and work than any other sprouter made. I will send you, free, easily followed plans for building this oat sprouter together with a full description of the Little Putnam Stove with which it is heated. The price of the stove is \$2 postpaid. Plans for building the Sprouter are packed with every stove, also instructions for using the stove to keep the water in poultry fountains from freezing.

You can't afford to be without this oat sprouter, even if you keep but eight fowls. Get a Little Putnam Stove from your dealer now. It will pay for itself many times before spring. Most dealers keep it. If yours does not, send me his name and \$2, and I will send you the stove, postpaid. Try it and if you do not find it all I claim and are not perfectly satisfied, send it back in 10 days and I will refund your \$2, together with the postage for its return. I'll run all the risk.

I. PUTNAM, Route 1005-S, ELMIRA, N. Y.

they begin to get their mature plumage, I change to white feeds, such as white corn, rice, middlings, etc. In this matter of feeding I use a barrel, 500 pounds of semi-solid buttermilk a week.

"Notice your hens at molting time. Eliminate any hen that has a tendency to show any brass in her neck. You can never breed white backed males from a hen that shows any sign of brass in her neck hackle."

That is sound counsel from an experienced breeder and judge, who has made a noteworthy success of his chosen variety. A breeder who reads and re-reads and then makes use of what Mr. Keeler has told in this article, gathers unto himself the fruits of a quarter century of study and effort.

Artificial Light.

(Continued from page 881.)

almost unimpaired vigor and little, if any, loss of weight. Weight in relation to production is a very interesting subject in itself. We will just say in passing that you must hold your hens up to their normal weight during this winter laying period. Beware of an excess of mash. Let them eat what they wish of it dry, but make the extra feeding a grain one, and all they can possibly hold.

When I state that hens must be fed in a definite manner when under lights, I mean by that that the schedule must be worked out and then adhered to. Some poultrymen at first thought that an entirely different feeding schedule would be necessary. This is not so. Use your regular feeding schedule, if it a successful one, and supply the hens with either whole or cracked corn or a scratch grain for the extra feeding, depending upon the time of the year and the nature of the hens—corn in cold weather, but scratch grain to the heavier breeds and in the warmer weather.

Generally hens under lights do not lay so many eggs in the spring as those without. This must be expected. The poultryman is grasping indeed who expects his hens to maintain a uniform heavy egg yield, both in the late fall and winter, as well as through spring. However, a correctly-lighted, strong hen will not drop much below her unlighted sister at any time, and in some cases not at all. It depends somewhat upon the hen, the care she has received, and general breeding and other circumstances.

At first it was believed that lights would double the yearly egg yield. This has been since discredited. But it would appear that hens correctly lighted will show on the average a slightly increased egg yield. Again circumstances alter cases, and sometimes we find a decreased yearly egg average with lighted fowls over corresponding ones unlighted. When this occurs there is usually a good reason, or several of them. The hen wisely pushed in winter will not be exhausted in spring, and then her natural instincts will come to her aid to keep her from dropping too low.

Lights With Breeders.

I know of no commercial farm in this country that has made a more exhaustive study of lights for breeders than has the Branford Farms of New London, Conn. Here for five generations the offspring of parents placed under lights have proven themselves increasingly good layers. And what is more, the hatching eggs used from these lighted breeders are as fertile, and the chicks as strong, if not more so indeed, than from test pens where no lights have been used. There are many poultrymen today—perhaps still the majority—who believe that they cannot use lights on their breeders and secure satisfactory results. While it must be admitted that it is not advisable to use lights for so long a period on birds whose eggs are intended for hatching purposes, we can safely use lights long and early enough to secure eggs for wanted early hatches. Thirty days ahead of the time these are desired is the usual time needed to bring a pen of breeders into good flock production without injuring the quality of eggs. More poultrymen are experimenting with lights for their breeders and find they can use them successfully, when properly applied. This is especially true in our northern sections where springs are late and early

LADY HOLLYWOOD II.

Laid 312 eggs—Nov. 5th to Oct. 31st. She was kept at the station until Nov. 4 and laid 315 eggs in 365 days. This is America's Highest Official Record.

THE GREATEST OF ALL LAYING STRAINS

BY OUR thousands of satisfied customers and our winnings year after year in official Egg Laying Contests we have proved absolutely that Hollywood has the GREATEST OF ALL LAYING STRAINS. This unequalled record has been made by us not with one or two winnings in dozens of trials, up one year and down the next, but by consistently winning, year after year, in all parts of the United States, from ocean to ocean.

MORE VALUABLE THAN THE
WINNING PEN.

Auburn, Wash., Nov. 9, 1920.

Hollywood Farm:

Our pen at the First Western Washington Egg Laying Contest produced the highest value in eggs. We give all credit to "Hollywood" males. They not only sired our pen, but also sired 500 pullets that have averaged for us over 200 eggs each in the last twelve months, which was more valuable than the winning pen. Yours very truly,

Scott O. Holt.

SECOND PEN AND AMERICA'S
HIGHEST OFFICIAL RECORD

Seattle, Wash., Nov. 6, 1920.

Hollywood Farm:

Gentlemen: I entered in the First Western Washington Contest, six pullets, hatched May 28th, from two settings of your eggs. They were hatched rather late and were not ready to lay when the contest started, but they finished second. No. 116, "Lady Hollywood Second," laid 312 eggs Nov. 5th to Oct. 31st. The management kept her until Nov. 4th and she laid 315 eggs in the 365 consecutive days, as officially attested. This beats Eglantine's record of 314 eggs made in the Delaware Con-

test and William's record of 311 made at Pullman, Wash. Will deliver pen to you today.

Yours truly,

C. H. Burnett, Jr.

Seattle, Wash., Aug. 30, 1921.

Dear Mr. Atkinson, Hollywood Farm:

The pen I purchased from Hollywood and entered in the Second Western Washington Egg Laying Contest is leading the contest, but your pen is giving me a hard run. I also have the best individual, with a record of 265 eggs to date, or for the first ten months of the present contest.

Truly yours,

J. W. Merriman.

1920-21 WINNINGS—REPORT OF PROGRESS

At the end of nine months we are leading in the Bergen County, New Jersey, twenty-pullet contest; have best Leghorn pen at Storrs, Conn., in ten-pullet contest; have second Leghorn pen at Georgetown, Delaware, in five-pullet contest; have second pen at Puyallup, Wash., in five-pullet contest. No such record ever was made or approached BY ANY OTHER FARM.

BREEDING STOCK AND LAYERS FOR SALE

WE HAVE FOR SALE the finest lot of BREEDING COCKS, COCKERELS, HENS, PULLETS and MATED PENS ever offered to the American public. All of them are closely related to our contest winners. Circular and price list free to any address on request.

hatching eggs are low in fertility. Even if
the later ones from a pen of lighted breeders
do not show quite the fertility they would
had no lights been employed, few of us will
regret securing valuable early eggs at the
expense of a few less needed ones later in the
season. It all depends upon when you wish
your hatching eggs. Lights can give them
to your earlier if you want them, and neither
you nor your fowls will suffer in consequence.

Lights With Chicks.

We find among other progressive poultry-
men, that Charles V. Keeler, Indiana, is us-
ing lights for chicks with marked success.
Professor Elford, of Canada, told me the
other day that they have used lights for
chicks up in the North with excellent re-
sults. A late lot of chicks, hatched Septem-
ber 4, were laying eggs early in January,
mainly due to the fact that lights were run
day and night. The chicks would rest a
while, and then eat, and repeat the perform-
ance. While this practice may not be rec-
ommended in all cases, it indicates what lights
can do to hasten growth and maturity. Here
again I would sound a warning. Do not ex-
pect your chicks to put in an 18-hour day
and secure double the size chicks than with
those on a 9-hour schedule. Surely, a few
extra hours per day will help bring late chicks
to maturity; they will come to proper broiler
size in good time, and will not show weakness
providing they have been sensibly fed. Eng-
land has tried experiments and found that
chicks cannot be forced too long—much the
same as with the older birds. Nature exacts
a certain toll for all effort expended, and if
we step beyond our bodily limitations, we
suffer accordingly. The later chicks do not
need lights, as the season has caught up with
their needs, and they thrive better under
natural conditions. Use lights with early or
very late chicks, and your results will be
gratifying, providing you study their needs
and limitations.

Lights With Late Hatched Pullets.

Here again we may use lights with rea-
sonable success. If your pullets are not
quite ready when the winter sets in, you
may hasten their maturity somewhat by using
lights. The same laws apply to these as for
older or younger ones—it is purely a matter
of more feed for the longer day. Tests of
lighted and unlighted late pullets show us
that the former will lay often a month earlier
than the latter—an advantage not to be
ignored when we are praying for every extra
egg. But again do not expect to push your
pullets to full laying maturity in a week or
so. They should attain their full bodily
growth before you expect a heavy egg yield.
You can secure eggs even from partly ma-
tured pullets, but these birds never lay large
eggs, and are seldom consistent, heavy layers.

Lights for Capons.

For capons which are "finished" in winter,
we may also use lights to some extent. Per-
mitting them a couple of extra hours per day
when the lights are long, capons gain flesh
more rapidly, and they are ready for market
sooner than those permitted to be without
food for more than half of each twenty four
hours. This enables the poultryman to cap-
onize the latest cockerels and still have them
ready for the proper selling season. It means
a shorter feeding and a longer caponizing
period—both decided advantages. One of
these days I am going to take a few hundred
capons and push them for all they are worth,
and just see how much can be accomplished
in this direction. I shall have a test pen of
equally old unlighted capons, and watch re-
sults. All of my poultry instincts tell me
that it can be done successfully. If lights
are used with good results with other classes
of poultry, why not with the capon? I wish
to hear from any poultryman who has made
any real experiments with them along these
lines. The capon has but one object in life;
to eat and grow heavy. It surely won't ex-
cite him if he is kept up a little longer each
winter day. As he is fond of his "eats" he
should welcome the extra meal so generously
supplied him. That it hastens his passing
away to market will not keep him from en-
joying his food.

The following methods have been tried,

Read this extract from a letter from
Mr. H. A. Daniels of Grafton, Mass.,
a successful breeder of Pedigree S.
C. R. I. Reds:

W. R. Curtiss Co., Grafton, Mass.
Ransomville, N. Y.

Gentlemen: Kindly quote me at your earliest con-
venience on Cut Clover in not less than 3 ton lots.

Will say that I find this to be the finest feed
for poultry there is. It insures sufficient bulk to
the ration and adds greatly to the splendid fer-
tility of the eggs. Have shipped eggs for hatch-
ing to every State in the U. S. this past season
with excellent results as to fertility and vigorous
chix.

Very truly yours,

H. A. DANIELS

tested and found more or less satisfactory:

Method 1. Turn the lights on between 3:30 and 4 in the morning, turning off as soon as the daylight is strong enough to permit hens to see litter plainly. Let the fowls go to bed with the sun, thus giving them about a twelve to thirteen-hour day. This is an excellent method, but requires either an automatic light arrangement or an early and faithful riser. I have tried this method with 2,000 pullets for one winter with splendid results. I was fortunate in having the laying quarters equipped with an automatic time clock, so the birds were already busy laying when I arrived around 7 a. m. In this case the morning scratch was thrown in the litter the night before.

Method 2. Reversing method one and supplying lights from twilight to about 8 o'clock, thus giving the birds about the same working day, but in a different manner. This method is successfully used by some, but not so popular as Method 1. Hens grow tired at the end of the day, and many of them will go to their perches with the lights turned on full. It is usually more convenient for the operator than Method 1, but not generally so productive of permanently satisfactory results.

Method 3. By turning on the lights at about 6 in the morning, permitting them to go until full daylight arrives. Then using lights from twilight to between 6 and 7 p. m. This gives the same working day as shown for Methods 1 and 2, but again differently distributed. The hens do well, but it requires more attention, and it is a little more difficult of regulation. Unless you have an automatic switch with proper dimmers, or unless you are unusually faithful and prompt, the hens are liable to receive a varying amount of light per day. It is understood, of course, that to dim lights means that at a given time the full strength of the lights is dimmed to simulate twilight, at which signal hens go to roost. After ten minutes or so the lights turn off completely, and the day's work is done. If you do not have dimmers you may train your fowls to a so-called "flash" signal. This is done by shutting off and turning on the lights two or three times a few minutes before retiring time. The hens soon learn what you mean, and will take to the perches promptly. Hens become so accustomed to lights being turned on or off at certain times that they will begin to talk about it if something interferes with the daily schedule. The longer they are deprived of lights some morning or evening, the more they will protest, until the whole farm is holding an indignation meeting. Then when the lights are turned on or off suddenly it is amusing to hear their cries of relief or joy, or whatever it is a hen feels under such circumstances.

Method 4. Known as the "evening lunch." Developed under Prof. Harry R. Lewis, of the New Jersey Agricultural Experiment Station. As Professor Lewis says: "The light question is merely a feeding question. If we can supply a hen with a given amount of feed in a day so as to enable her to lay well through the winter period by using the evening lunch method, why keep her up a minute longer than that?"

This method is used in the following manner:

The fowls are permitted to get up with the sun and go to bed at twilight. They are fed exactly as though no lights were to be supplied. Then at 7 in the evening the lights are flashed on, and for a hour the hens are permitted to enjoy an extra heavy feeding of grains thrown in the litter. At 8 it is "lights out," and they are in bed again with full crops and the assurance of happy dreams. Simple—and practical. The hens receive the extra grain ration they require. Their rest is practically unbroken, or at least they receive more rest than shown in Methods, 1, 2, and 3, and chart records show us their egg yield to be even heavier than under any other method, or without lights. Furthermore, the "evening lunch" ladies have a tendency to maintain their bodily weight more uniformly, and their total yearly egg yield is very apt to be higher than under either of the other three methods or again without lights. The graph shows an equally heavy spring production as compared with unlighted

"The Best We Ever Used"

HILLCREST-EVERLAY FARMS

S. C. White Leghorns

ROCKVILLE, CONN.

"Candidly, we have found Carbola the best article of its kind we ever used. We tried whitewash, half a dozen different formulas, times out of number, and never got satisfaction. We never could get a mixture that did not clog our sprayer, and it seldom dried white. Carbola never clogs the sprayer, and always dries white. And aside from its disinfecting qualities, it is worth its cost as a whitewash.

"We have used the dry powder as a louse killer, and find it very satisfactory; we know of no other we can buy at ten cents a pound. We spray our houses with it, dust our hens, dust the nests and brooders, and use a thin mixture for washing out our incubators. We also have used Carbola in our house cellar with most satisfactory results."

January 10th, 1921.

Boost your Egg Yield Now!

HANG a Coleman Quick-Lite Lantern in your hen house a few

hours these winter nights and mornings. It puts your hens on a spring laying schedule. Longer feeding hours greatly increase egg production. Users report from 15% to 20% more eggs. Poultry authorities and practical poultrymen recommend artificial light to boost the egg yield. Thousands are now making bigger profits by selling more eggs than ever at high prices.

Style
LQ-327

Coleman Quick-Lite

"The Sunshine of the Night"

Makes and burns its own gas from common motor gasoline. Gives 300 candle power of brilliant white light. Brighter than 20 old style oil lamps. Can't spill fuel or explode, even if tipped over. 12 hours of light on one filling. Lights with matches—no torch needed.

Built of brass, heavily nickel-plated. Will last a lifetime. Mica globe and reflector. Won't blow out. Handiest and most convenient light you ever saw. For very large hen houses we manufacture the same form of lighting in a complete plant, equipped with fixtures, globes, etc.

15,000 DEALERS sell Coleman Quick-Lite Lanterns, Lighting Plants and Lamps. If you can't supply you, write us for booklet "More Light—More Eggs." Address nearest house, Dept. AP18

When Choosing an Incubator Demand Proof Not Promises

ANY manufacturer can make you all kinds of glowing promises regarding the efficiency of his machine. But *promises* don't hatch chicks—*promises* won't make good your lost time and unhatched eggs. Demand proof, *absolute proof*, of efficiency, economy, dependability. Then get the *right* incubator *first* and so avoid trouble, worry and expense. We tell you that "the Newtown hatches the most chicks, the best chicks, with least labor and at lowest cost." And *we will prove it* to your satisfaction. The proof is ready—it's yours for the asking. Signed reports from Newtown users in all parts of the world telling what this wonder-machine has done for them under all conditions of climate, altitude, place of operation, etc. Detailed statements of results which far exceed any claims we could make.

Weigh the evidence, check *promises* against Newtown *proof*. The new book is *free*. Ask for your copy now. State what size machine you need and we will make you an interesting proposition.

You Can't Go Wrong

The first successful coal-burning colony brooder—the machine that revolutionized brooding methods. Imitated, but never equalled. Get the *original* Newtown and *raise* your chicks. Learn why the Newtown leads. Just ask for new Brooder circular.

Newtown Giant Incubator Corp., 21 Warsaw St., Harrisonburg, Virginia

Artificial Light in the Poultry House

has increased the egg
production of some
flocks as much as **100%**

GEORGE NEWELL discovered that by the use of artificial light in his laying pens during the early morning and evening of short days, he doubled his egg yield. He put the results and methods of his experiences into a book called

A Revolution in Egg Production

This book is not a collection of clippings and theories like so many poultry books, but contains the results of common-sense ideas which have been put to test and found practical. They do just what they say they will do—**increase the average egg yield 100%.**

It is profusely illustrated and contains chapters on Care and Feed in General—Balancing the Ration—Conditions Should Be Watched and Noted—What to Feed—Underfeeding—Overfeeding—Automatic Feeders—Fussing vs. Economy of Time—Water Problems—Housing, Ventilation and Light—Trap Nesting—Incubators or Hens for Hatching—Brooding Problems—What Breed?—Meat Production a By-Product—Yards and Exercise—Spring and Summer Eggs—Fall and Winter Eggs—Care of Eggs—Ask the Birds; Their Judgment Is Good—Production Under Present Conditions—Production Records.

Cloth bound, 112 pages, handsomely illustrated, postpaid, price \$1.00

American Poultry Journal Pub. Co., 523 Plymouth Ct., Chicago, Ill.

What's a CAPON and Why?

A book that explains everything you will ever want to know about CAPONS. 50 pictures from life that show each step in the operation. List of Capon Dealers' addresses. Tells how to prevent "Slips" where to get the best and cheapest capon tools. Capons are immense eating. Big profits realized. Get wise. This book tells how. Copyrighted new and revised edition. Regular 50c copy, prepaid to your address (a short time only) for a Dime in coin or stamps. GEORGE BEVOY, R. R. No. 7, CEDAR VALE, KANS.

hens. Another advantage is its convenience. The hens can be given their proper attention, and we can still get to the second movie with a clear conscience and contented hens. Of all the methods so far worked out and tested, it seems safe to say that the ingenious "evening lunch" is the simplest, most practical, and most productive of good results, at neither the expense of the hen's health nor the convenience of the operator.

Some Artificial Don'ts.

1. Don't expect lights to cure your hens of troubles caused by carelessness—they won't.
2. Don't expect poor, undeveloped, "cull" hens to lay their heads off because you furnish them with the latest kind of illumination. They will go to pieces rather than lay well. Their weaknesses become even more apparent.
3. Don't expect to push the button and have the hens do all the rest. Study their actions under lights. Reduce or increase lights and feed as the circumstances require, and be sure that your hens are "standing up" properly. Better no lights at all than improperly used. Good pullets will lay well in winter without lights. Poor ones will lay hardly an egg more with lights—sometimes fewer.
4. Don't think because you have had one successful season with lights that you know all about the subject. Poultry investigators are studying the matter unceasingly, and if they think there is still something to learn, we are safe in following their footsteps.
5. Don't say that lights are of no value because you were unsuccessful one season. Your method and care were to blame, not the lights. They can yield you big profits.

Some Light Recommendations.

Supply your fowls with enough light so that they can see objects plainly in the litter. The exact amount of candle power per unit of layers depends upon the size of the house and the nature of the interior. Usually two 25 Watt lights in a 20 by 20 house are enough. Better than one 50, as the light distribution with two is more uniform.

Hang the lights so that you will not bump into them constantly. This is hard on the bulbs and inconvenient for all.

Be sure light distribution is even with as few shadows as possible. Have 14-inch reflectors which will throw the light on the floor—you do not need a light ceiling.

Electric light is really the only practical kind of light for flocks of any size. Some patent lanterns do well for small flocks, but when numbers are used their care becomes too irksome and requires too much time. Besides they always present a decided fire danger.

Be sure your wiring is safe and not subject to a short circuit. If well wired your houses will be practically immune to this danger.

Above all things stick to a certain, fixed method when you are once convinced you are right. Don't make a change in the middle of a laying season, even if you feel another method would have been better.

If these various recommendations and suggestions are followed, and you continue to study this subject, as well as keep your "weather eye" open on your birds, you will find the use of artificial lights to be of considerable benefit to you—a friend in need in the long, cold winter months when eggs are worth their weight in good currency of the realm.

However, don't kill the hen that lays the golden egg. Have the hen and the egg both.

It is absurd to cry "All is harmony" when there is no harmony. The naked truth is that never was there such dissension in the ranks of the A. P. A.

While the east was crying about "sectionalism" and the fact that it was left out in the cold, the breeders of Indiana were meeting at Indianapolis during the State Fair, and discussing the advisability of organizing a new association. Nobody seems to be pleased.

This situation is not without its cheerful side. It shows, at least, that the period of reaction has set in, and instead of well known poultry writers asking, "Is the fancier asleep?" they can discuss what is to happen now that the master has awakened from his slumber and has put on his shoes.

The Mark of
QUALITY

Three Thousand Pullets Show Birds for Fall and Winter

OAK DALE Pullets are the progeny of all the famous winners at Madison Square and Boston during the past twenty years. The Oak Dale strain of White Leghorns has been restricted to only the choicest individuals, thus assuring you that the pullets purchased are the best that can be had.

Every one of our show birds bears a remarkable likeness to its parent stock, because for the past 20 years the birds of this wonderful strain have been so mated that it is only natural to expect them to carry away the most coveted prizes.

When you but stop and think that for the past 20 years we have been carrying away the best prizes at Madison Square Garden and Boston, is it any wonder that Oak Dale birds can go into a showroom and carry away the highest honors?

1921 Mating List Free

Send today for this booklet and therein you will find listed the most marvelous Single Comb White Leghorn winners of the past twenty years. And whose progeny we are offering to you at prices within the reach of all. We can also furnish you with Pens, Trios, Pairs and Single birds.

Strive to Improve Your Stock

(Continued from page 884)

mash hoppers for at least part of the day and pushing the consumption of scratch grain, by feeding it three times per day and in quantities that the pullets demand. The grains increase their weight, build muscle, add a little fat, and store up energy, all of which will be more than necessary during the season to follow.

The pullets that go into the winter without this added bit of flesh and fat are not equipped for a long season of egg production. If the pullets have not developed as well as you think they should, give them a little sour skim-milk or buttermilk on the side. And be sure they have green food. Put them into the pink of condition before closing them up and feeding them for winter egg production.

Speaking of Quality.

As October passes day by day there will be differences appear between the pullets. Some will prove to be poorer in quality than others. It does not pay to winter over a poor pullet. There are certain earmarks that betray the worthwhile pullets. Good flesh indicates ability to maintain their body weight and parts. Size usually means vigor. Activity means pep and strength. Bright, clear eyes mean health. Well developed head parts point to business ability. Clear, yellow pigmentation means a good reserve. Avoid saving the puny, runty, undersized pullet. You'll never make money on her and she'll hinder the development of quality in your flock.

Make a rigid selection from among the season's offering.

Have the poultry houses in readiness for the pullets. Good pullets must have clean quarters and sanitary environment if they are to go in good health and become high quality hens. In getting the houses ready follow a system and be thorough. Suggested steps are:

Clean out all old litter from floor and nests.

Sweep down the walls, ceilings and curtains.

Disinfect the whole interior with a 5 per cent solution of some good coal tar or other reliable disinfectant. Use white wash if you want the interior clean and white and bright. The writer does believe that if the inside of the poultry house is white and bright it has a certain good effect on the health of the birds. If you want a good disinfectant whitewash make it up as follows:

5 parts of cream of lime (by cream of lime is meant the fresh stone lime slaked with boiling water).

½ part disinfectant.

1 part kerosene.

Equal parts of hot water. Add salt, glue or lard to help make it stick. Keep it stirred and preferably apply with a force pump. It kills the mites and disease germs.

Let the house dry out for a few hours.

Put in new, clean litter, and return the fixtures.

This is not a rainy-day job. Do it on a bright, drying day, and begin early in the morning. Shut birds out of the house during that day. This job always pays.

Remember that the pullets we pick this fall are the breeding hens of another year. Feed the selected pullets mash, grain, succulence, and milk.

Rose Comb White Leghorns.

(Continued from page 882)

for body maintenance and has less surplus energy to convert into eggs. The natural result is either reduced production of eggs as the food is used for the other purpose or else increased consumption of heat producing food, and generally speaking both results are noted to some extent.

Moreover, the low, broad, rose comb shows to a beautiful advantage, and is the chief source of argument in favor of the Rose Comb White Leghorn. Anyone who has not heretofore appreciated the utility of the rose comb can readily test it by holding one naked hand outstretched and the other tightly clinched in an unheated building on a severe winter day. A ten minute test will serve to convince the most skeptical that here indeed is a point of great advantage, for the finer tips on the outstretched hand will freeze while the clinched hand is still fairly comfortable.

Unfortunately Rose Comb White Leghorns have not fared well at the hands of the breeders who, in most cases, have not been far sighted enough to enter them in public laying contests. The first public laying contest in Australia, some twelve years or fifteen years ago, was won by a pen of Rose Comb White Leghorns while the second national contest at the Missouri Experiment Station was won by an individual Rose Comb White Leghorn hen which established the then wonderful record of 260 eggs in one year. There have been but few of this variety at recent contests.

Rose Comb White Leghorn hens have made private records running as high as 307 eggs in a single year's laying, and a pen average of 241 eggs per hen, which together with the above public records surely establish the fact that as profitable egg producers they are unsurpassed.

Another point of excellence lies in the fact that the ideal Standard type of Leghorn, as described by the Standard of Perfection, is also the ideal egg producing type—that long medium deep body being a typical egg factory.

Any person who contemplates taking up poultry breeding, or who is not satisfied with the variety which he now keeps, can find no better field for the employment of his time and poultry equipment than in the breeding of Rose Comb White Leghorns. The demand for stock and for baby chicks at profitable prices is unlimited, judging by present standards, and if one is in position to produce trap-nested stock in an honest and scientific manner, the reward will be very great indeed.

From the exhibition standpoint no fowl excels a properly conditioned White Leghorn in beauty for it combines a very attractive color scheme with that wonderful grace which is peculiar to the Leghorn family. To rapidly increasing number of poultry breeders the Rose Comb is more attractive in appearance as well as more useful, and we are looking forward to the not distant day when our favorites will be the favorites of many additional breeders.

I Made over \$2,000⁰⁰ With My Hens

In 12 Months' Time

—Says Mrs. H. A. Hume

**Read
Her
Letter**

MR. T. E. QUISENBERRY,
President American Poultry School,
Kansas City, Missouri.

DEAR MR. QUISENBERRY:

I did over \$2,000.00 egg business last year. I surely have been successful with poultry since becoming a student of your school. Three years ago I knew absolutely nothing about culling, feeding for egg production, fertile eggs, or housing. Now I am confident I am capable of handling a flock of any size I care to, and do it successfully.

White Leghorns are no longer a side line with us. They are one of the main issues, as we realize more clear profit from our Leghorns than from any one grain crop, or the live stock, raised on our 400-acre farm.

Yours very truly,
MRS. H. A. HUME.

\$2,000 On Eggs Alone!

Just extra money for Mrs. Hume, who started to raise chickens and sell eggs only as a side line.

Thousands who have followed the advice of T. E. Quisenberry in Poultry Raising have earned as much or more than Mrs. Hume. Whether on a large scale or with small flocks, they have made big money from their poultry. Read here what they have to say:

Make Over \$1,000 On 200 Hens

"By following your simple advice I sold, from 200 hens and pullets, \$1,288.58 worth of eggs, baby chicks, broilers, cockerels and pullets in exactly seven months. My feed bill was \$246.89. The eggs alone amounted to \$490.92, besides 276 dozen I set in the incubator. My success is entirely due to you. I would not part with the information you furnished me at any price."—Mrs. Chas. Rooks, Ohio.

You Can Do As Well

Whether you have a general farm or a back-yard flock, whether you are an experienced poultry raiser or just starting, you can make big profits this year with the practical knowledge that we offer you.

BIG FREE BOOK Act Quick And Now!

Send today for the big, fully illustrated, 96-page book that tells all about the wonderful profits in the poultry business and how you can get your share of them. This book is of such value to every man and woman who raises poultry or expects to, that you should not be without it. Mail the coupon or write a post card today, before they are all gone. Remember, this book is free and we pay the postage. No obligation on your part.

There was no record kept of value of eggs used at home.—H. M. Luttrell, Ky.

Feeding Methods--Big Egg Yield

"As a result of the feeding methods you worked out for me, I am surely getting results; in fact, from pens today (October 23, 1920), containing 600 pullets, I received 345 eggs. Very often they run more. One pen of 100 ran 73 percent today, and one around 65 percent for the entire month. Really I am making money before I expected."—William Shands, Missouri.

Selecting Buff Wyandottes.

By Henry Trafford.

The extremely important work of culling and selecting breeding stock is often put off too long or entirely neglected. There is a great tendency among poultry breeders to retain and breed from "any old pullet," particularly if the crop of pullets is limited. This plan of breeding is bad as it only multiplies the defects of these poor pullets in the next year's crop of young stock.

It is far more satisfactory to breed only from pullets or hens which measure well up to standard requirements and place the defective birds in pens kept for laying only.

Now what I am going to say about culling and selection of Buff Wyandottes for breeding applies in principle to every other Standard breed of chickens.

The Buff Wyandotte is a bird of curves, body moderately short and of good depth so as to admit of unrestricted development of the egg laying organs. Remember that extreme length of body does not necessarily denote heavy laying capacity while good depth is an essential element of egg production and the Standard well bred Wyandottes are noted for their deep, well rounded bodies giving plenty of room for the egg organs to function.

The Buff Wyandotte, the same as all varieties of Wyandottes, should be full breasted. A bird showing a flat narrow breast should be culled out and not be bred from as a deep broad well rounded breast is one of the outstanding characteristics of all Wyandottes and the Buff Wyandotte has no reason to take a back seat in this respect.

Special attention should be paid to size, shape and carriage of tail. Long tails are not necessary to heavy egg production and to my mind spoil what otherwise might be a good typical bird.

I once owned a cock bird which aside from the size, shape and length of his tail, was a winner. But when his tail was in he was anything but a typical Wyandotte.

Select birds for the breeding pen which carry a short moderate low tail well spread at the base and free from foreign color.

I am a crank on "saddles." I cannot tolerate a narrow or pinched saddle no matter how good color the bird is and right here let me say that altogether too many breeders of Buff Wyandottes go "color crazy" and lose sight of the most important thing of all, namely, type. If I had to choose between color and shape I would by all means take shape but all of us, of course, are striving to get both color and shape in our flocks of Buff Wyandottes and by pursuing a persistent and systematic line of culling each year rapid progress should be made in this direction.

The exhibit of Buff Wyandottes at the Madison Square Garden last winter was a surprise to many. In color the Buff Wyandotte does not take second place among buff colored fowls of any breed and in the best flocks typical Wyandotte shape in quality is not far below that of other varieties of Wyandottes. Briefly, this was about the character of the Buff Wyandotte exhibit at the last Madison Square Garden show which was so much admired by visitors and fanciers.

Buff Wyandotte breeders, that is

speaking of them as a whole, have had some trouble in maintaining good combs. The tendency has been to too much comb development which gives the bird a coarse appearance about the head. However, very great improvement has been made in this direction. A bird to find its way into the breeding pen should, in my mind, possess remarkable good qualities in other sections to entitle it to this distinction if the bird under consideration has a coarse ill-shaped comb.

Eye color is another thing which should not be ignored in selecting birds for the breeding pen. The Buff Wyandotte eye should be bright red giving the bird a sprightly healthy appearance. An eye with a dull red color is about as objectionable as a pearl eye.

By all means steer clear of "snake or game heads," this very bad defect is caused by an extremely long bill, a low crown and sunken comb. Snake or game heads are more common in pullets than they are in cockerels and under no circumstances should a bird of either sex, having an extremely long head and bill be bred from.

Be very careful about getting your birds "up on stilts." They will naturally get that way unless careful culling is maintained to eliminate this objectionable feature. Neither do we want to make creepers out of the Buff Wyandotte. Try to strike a happy medium as this is about the right length of leg to build Buff Wyandotte bodies on.

Color of ear lobes is another thing which we must give due consideration as a breeding bird of either sex introduced in the breeding pen which has white in ear lobe is like a seed planted in good soil. It will multiply quickly.

I have now touched upon the most important points in culling and selecting Buff Wyandottes for the breeding pen. There are other things, minor in importance, that should not be entirely ignored in selecting birds for your breeding pens. But before I finish I want to say something in general about buff color and the things that the breeder should strive for in breeding Buff Wyandottes.

There are several shades of buff, ranging all the way from a light lemon buff to a deep colored buff approaching red.

The fad for very light buff has very largely passed and the shade of buff now most in favor is about half way between a very light shade and dark shade stopping short of the brick colored buff.

No one has ever yet been able to perfectly describe buff color or even give a fair rendering in oil or lithograph reproductions so that I am not going to attempt a thing which has for so many years baffled artists and best writers in their attempts to picture and describe buff color. We can come somewhere near describing buff by quoting Webster as follows: "Buff is a light yellow shading towards pink, grey or brown." Now do you know anything more about buff color than you did before? Webster's definition of buff color simply puts it in its proper class among other colors but fails miserably in defining shades of buff color.

The very best we can do in establishing color for Buff Wyandotte is to strike a happy medium and avoid extremes. Perhaps a gold coin is near enough to the proper shade to be strived for.

Uniformity in shade of color free from

black or white are the most important points to be sought for in breeding Buff Wyandottes. Be careful and not breed from birds which show two or three shades of buff and the breeding pens should match in color also for best results.

Under color is important but surface color is vastly more important. However light under color denotes a lack of buff pigment and is likely to produce white in the offspring.

Start this month to cull out and select your breeding stock.

Starting In Poultry Business.

H. G. Forster in your September issue puts the cost so high in establishing a poultry business that it will act as a deterrent to many who can successfully begin on just one-tenth as much. Why do I say so? Because I know.

One of the most successful poultrymen left the city when 57 years old, with \$1,200 and in a few years became noted. He left school at 13 and worked hard until 57. Since he has been a member of the state legislature, treasurer of the state grange, and has lectured before many of the largest colleges, such as Columbia, Cornell, etc., upon poultry matters. The leading rural papers always refer to him as an authority. He bought a farm fourteen miles from a small eastern city for \$600 and kept \$600 for expenses until his poultry began to pay. He writes me that not a single year since he began 27 years ago has he netted less than \$500 a year and often laid away over \$1,000. Now at 84 he is still very active and a frequent contributor to the rural press. Himself and a boy of 14 did all the work.

The Knapp Brothers, most successful poultrymen, have a rocky farm in central New York five miles from a depot. I do not write of what is possible by borrowing a setting hen and buying a dozen eggs at the store and in a few years being independent, but I do know that perfectly suitable farms can be had for under \$1,000 where all the food can be raised on them for several thousand chicks.

If a man has his bare hands, he can go to any farmer and arrange to run his poultry on a share basis and in three or four years have his own plant. It isn't right, Mr. Forster, to preclude the future to many men with \$1,000 or even their bare hands, because they haven't \$10,000, from a successful poultry business. In my trips through New England and central New York I have seen many, yes, hundreds of farms, just awaiting a man with business principles to take hold of a poultry plant and live happily and comfortably.

And here in southern Maryland, with markets nearby by steamers, a man could come and have his keep for himself and family, his garden, his rent and one-third of the crop, and get it all through the hens; and he could own his own plant in three or four years. Fellow poultrymen and fanciers, if you have your hands, or one hand and a thinker in your head, let me tell you that is all you need. Mr. Forster must not put a wet blanket over your hope to raise hens. If you are 12 years old, begin; if you are 65, begin; but you must employ business methods — no slacker allowed in the hen yard.

Maryland. Elbert Wakeman.

Brood Your Chicks 30 Days FREE!

1,500 Chicks around one stove

Also small size stoves. No hovers to bother about. No gas, no fumes, no ticks, no smoke. All bother and worry gone. Losses reduced to a minimum.

Use this wonderful new Simplex Brooder Stove in your own brooder house 30 days absolutely free. Write for free Brooder Book fully explaining offer. Try the stove under all conditions. Make any test you know of. Then, at the end of 30 days, if you are not delighted send it back and we'll cheerfully refund your money. You alone are the judge.

Turns Losses to Profits

This wonderful new brooder will raise 50 per cent more of your chicks than you have been able to raise by old-fashioned methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by extra money it makes.

Saves Labor and Expense

The Simplex Brooder Stove means one-tenth as much work — costs one-fourth as much to operate as any other system. It is self-regulating — needs no watching — eliminates all worry. Try it 30 days free.

Send for **Free Brooder Book**

Send today for valuable book that tells how to "Increase your Profits by Decreasing Mortality" — absolutely free. It tells how to solve your brooding problems. It tells how to save the chicks that you have been content to lose every year through disease and faulty brooding — how to make twice as much money from your poultry. HALL

for Bigger and Better Hatches

This practical favorite among incubators has long aided industriously in the cause of American poultry raising and has gained as great a popularity across boundaries and oceans as well.

Since the first HALL Incubator came into the poultry field twenty-six years ago it has proven to the skeptical poultry man these three vital points that are essential to successful poultry raising:

- First:** The reliability of the HALL Incubator.
- Second:** The larger hatching percentage of strong, healthy and productive chicks.
- Third:** That HALL Hatched Chicks of HALL Hatched breeding stock will, as hatches go on, produce a better breed of chicks, in fact, a perfect chick, that for size, vitality and productiveness cannot be surpassed.

It will pay you to investigate the exclusive features of HALL EQUIPMENT before purchasing any other.

Write for our new book "HALL EQUIPMENT." It is a valuable book of information and instruction. Sent upon request to all poultrymen or prospective poultrymen.

The Silver Penciled Color Type.

By Rev. T. W. Harwood.

The silver penciled varieties are suffering no neglect at the hands of the American Poultry Journal. It is to be hoped that the other poultry publications may find them worth attention also. In Platt's article of last month on Silver Penciled Wyandottes there is much food for thought, not only for breeders of that variety, but for fanciers of those kindred varieties that carry the same penciled feather markings. For Dark Brahmas and Silver Penciled Rocks the Standard color description is in identical terms with that for Silver Penciled Wyandottes. Though not yet in the Standard, Silver Penciled Leghorns and bantams are on the way.

As signs are not lacking of a drift of interest among fanciers towards the color-scheme of the old Dark Brahma, it becomes increasingly important for breeders of silver penciled birds to compare notes in order to reach an understanding both as to penciling and ground color. If unity of aim could be approached, it would help the breeds and eventuate in a greatly improved Standard. At present there is enough diversity of aim to make judging unsatisfactory and retard progress.

There is a story that, in the early days of the automobile, a farmer approached a man who was tinkering his machine by the roadside with the question, "How many horsepower has that machine of yours?" "Sixty," was the reply. "By heck, why don't she go then?" said the farmer. "Because thirty of them are pulling one way and thirty the other," said the owner. That there can be more progress if all are pulling the same way is just as true in poultry matters. It is also true that when we pull three or four different ways there is danger of going to pieces.

Editor Platt is not open to the charge of having a single track mind. He is generous enough to present us with two ideals for the ground color of the penciled feather in the same article. Ezra Cornell, originator of Silver Penciled Wyandottes, is quoted in favor of black penciling on a white ground. This, says Mr. Platt, "is the goal to aim for." His concluding paragraph speaks of "The beautiful combination of clean steel gray, penciled with distinct bands of soft black, which is the real beauty of the Silver Penciled Wyandotte pullet at her best." Here are two distinct feathers, one black markings on white; the other black on steel gray. Cornell versus the Standard. If we accept the Standard, how can we make Mr. Cornell's color-scheme our aim?

Now I am not simply trying to impale Mr. Platt on the horns of a logical dilemma. The difficulty of his position has been a practical one with me and with other students of this delightful breed. I have pullets in my yards now with the Standard gray ground color and others, not indeed the Cornell black and white, but a ground color much lighter than steel gray. I am fully alive to the beauty of both, and feel like the fellow in love with two girls:

"For I could be happy with either,
If t'other dear charmer were gone."

Mr. Platt has my sympathy. Still, in this article, I stand by Ezra Cornell for the black and white as both the true

and the possible ideal. No breeder should be ignorant of the Cornell idea, and Mr. Platt does valuable service in reminding us of it.

In the past, judges have not needed to be very critical as to dark or light ground color. It has been hard enough to find silver penciled females with a regular and definite penciling on a ground color free from brown. The bird with those two qualities has been rare enough to win, other things being equal, regardless of whether her ground color was light or dark gray. One thing, however, is true. Penciling that stands out most distinctly is most attractive. That the lighter the ground color is, the more the penciling stands out, is also beyond dispute. It is also a safe bet that, Standard or no Standard, there are a number of judges who simply could not get by a female with an even penciling on a light ground.

Older exhibitors may remember a hen shown at Boston around 1910 for perhaps three years by Mr. Hathaway. She was positively unique. No judge could possibly place her anywhere but first. Her penciling was uniform from breast to tail; her type was good; but what most impressed me was the unusually light ground color which made that penciling stand out clear cut and distinct. Nobody seemed to know how she was produced.

Nothing like her appeared after. Some of us now know that the only kind of male by which she could have been made to reproduce her color was one with a light undercolor that her owner and most other breeders at that time would summarily condemn to the block as a hopeless cull.

While regarding undercolor as a sufficiently uncertain factor to be left entirely to the breeder's discretion, I am disposed to admit a seeming correspondence between the undercolor of the breeding male and the ground color of the penciling on the females that he produces. Mr. Platt's article suggests this, and, if it is true, the key to the production of much finer penciling than we are accustomed to see is not far to seek.

If Ezra Cornell wanted black and white, why does the Standard call for black and gray? Without knowing the facts I will hazard a guess that those who wrote the Silver Penciled Wyandotte Standard were influenced by the Dark Brahma Standard, and that in this way, instead of getting a new start, we inherited an old Standard with all its breeding traditions. With it we got a Standard for the male which made a light ground color for the female's plumage permanently impossible.

I have not Mr. Cornell's exact words before me, but they were to this effect: "The penciling of the female should be black on white. It is necessary to ascertain the male that will breed this marking on the female and then make the Standard to fit the birds, and we shall have a breed to bank on." The dogmatic power of the Standard has postponed the fulfillment of Cornell's beautiful dream. Once let a thing become the accepted Standard and very many people assume that no other idea is worth consideration. Coupled with this is the idea that all particolored birds must be produced by double mating. With some old school fanciers this is a perfect obsession. You may tell them the facts and show them the birds all

GREEN SHEEN STRAIN

years. During the same period, I have had 147 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

Write me for information. Your absolute satisfaction is guaranteed.

FRANK E. HERING Desk B SOUTH BEND, IND.

Silver Campines

Elegant young stock, well grown, now ready for sale at fair prices. A wonderful selection of cockerels, pullets, cocks and hens at your command. I am especially prepared to furnish exhibition birds that will win for you and prove to be sound breeders. My birds are single mated and exhibition birds are mated together. No trick back of these birds.

Campines are fast growers, plump at all ages, heavy layers of large, white shelled eggs and eat less food than Leghorns.

I have the largest plant devoted to the raising of exhibition and high egg-record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 62 males placed under ribbons at the Coliseum Show in last nine years.

to no purpose. "No, sir, there ain't no sich animal."

How are the best silver penciled birds actually being produced? Perhaps double maters are a majority, but I don't know them. The most successful breeders in the vicinity of Boston are single maters. Those I have met in the neighborhood of Chicago are of the same mind. Some who specialized in females or ran two matings some years ago, became single maters as soon as the Standard dropped the dark slate undercolor requirement for the male. We found we had exhibition males among our pullet breeders; so we were converted to single mating by our birds.

Mr Cornell's advice to make the Standard fit the birds by standardizing the pullet breeding male affords the only way out from that maze of indefinite multiplication of closely similar breeds in which the fancy is becoming involved. Two breeds of Brown Leghorns already! Both logic and justice call for a third one, Medium Brown Leghorns. Three breeds of Barred Rocks come next. All this comes about because some group of breeders once picked out a male they liked and put him in the Standard regardless of whether he belonged with the females or not. Thereafter the conventionally minded people will swear to the unimprovable beauty of that Standard male to the extent of making another breed to save him.

It is well to remember that there are two kinds of beauty, intrinsic and conventional. The girls' enthusiasm over dress styles exemplifies the conventionalized sense of beauty. They have raved over the prevailing styles ever since the daughters of Eve devised new combinations of fig leaves. There is little intrinsic beauty in either hobble skirts or hoop skirts and none in bustles, yet all these were "perfectly stunning" when they were in style. So an accepted Standard rules at times by the force of convention and makes all other styles of plumage appear objectionable to those who do not hold their minds independent. Yet a variant type may have more intrinsic beauty. The pullet-breeding Barred Rock male is not a monstrosity. He is a splendid bird. Had he been made Standard at first, no Barred Rock breeder of today would be able to see beauty in a dark male.

Coming back to penciled birds, we should aim at black and white penciling even if we must use males such as Mr. Platt describes. They will not have "sound" color. Yet, while defective in some points of the present Standard, they will be beautiful birds.

Why double mate to breed the black and white female? When we depart deliberately from the Standard for our females, why continue with the old style males? Let us go the whole hog, study the new male and develop him also to an ideal of beauty that will best correspond with his mate. Yes, sir, it is dollars against doughnuts that, when a few fanciers raise birds of the new type and have the courage to show them, ribbons or no ribbons, they will win admiration and recognition.

Buff Color.

Breeding a light male to dark females with the idea of having the young stock strike a happy medium is a mistake and is quite apt to result in disappointment. The reverse of this plan of breeding is just as likely to be a disappointment as well.

ELECTRIC LIGHT AND POWER

On Your Own Terms

Do Your Work the Electric Way.

Harness electricity to your daily tasks. It will save you hours of drudgery and add years to your life. Electric power is not only a convenience on the farm and in the farm home—it is an everyday necessity. Don't be without this great time and labor saver when you can buy an efficient and up to date plant at such a low price and on such easy terms as we offer.

Our low prices and easy terms bring the conveniences of electricity on the farm within the reach of everyone. Don't be without this modern farm necessity when you can buy an efficient, guaranteed electric lighting plant on your own terms.

Our electric light and power plants are not an experiment. Our plants have been in operation in all parts of the country for several years. We have watched their performance and we know they will do the work. That is why we can offer them on such easy terms. Send for our electric lighting plant catalog today and read all about our easy payment plan, and compare the prices of our plants with others of the same size and efficiency. Just sign and mail the coupon below.

MORE EGGS WITH ELECTRIC LIGHT.

Increase your egg production during the short days of Fall and Winter by the use of electric light in the poultry house. Experiments carried on under direction of the New Jersey State Poultry School show amazing results. Production more than doubled.

Bright, Safe Light at the Touch of a Button.

Electric light in the farm home and farm buildings is a Twentieth Century necessity. It is convenient, it is safe, and it is far more efficient than other methods of lighting. Electric light makes your work easier and more pleasant, and enables you to enjoy all the comforts and conveniences of the city home. Electricity on the farm multiplies man power and saves both time and labor.

Guaranteed Replacement Batteries—Liberal Allowance on Your Old Battery.

We can furnish a new battery for any make of lighting plant. If your old battery is worn out, ask for Circular No. 98A82 which tells all about our liberal exchange allowances and definite service guarantee.

Black Langshans.

All my life I have been constantly striving, and after accomplishing, have aimed anew and taken another shot. The result satisfies me. A happy and prosperous life is gained by always looking upward and going forward, instead of looking downward and going backward. Of course I have yet much to learn. I want to learn and will learn. This applies particularly to my poultry.

It was in 1900 that I took a fancy to the Black Langshans, I gave no peace to my family until I purchased a fine pen of the black tribe from a fancier in Illinois. They were quite attractive to my friends and neighbors because I was the first to bring the variety into our section. It would be needless to say I was proud of my new flock—exceedingly proud. The Black Langshan with its greenish glossy black plumage, broad breast and back, prominent comb, bright black eye, strong, long legs covered with top feathering that reminds me of snow shoes; birds that stand high, step higher, and strut before folks as if they were displaying some sort of fashion; birds that are every inch a thoroughbred, made a deep impression on me as they have on others who see them, and I soon found myself interested in Langshans. The first year I raised all I possibly could, and finding them so hardy. I had no trouble, and had 73 big, well-grown pullets for the next year. At that time I lived on a farm, and had the place shining with the glossy black fellows, hatching from three to five hundred each year. A few years ago I left the farm, but did not give up Langshans. I took to my city home 12 of the best hens and one cockerel. Again, I seemed to be the only one around displaying Langshans and their attractiveness caused them to be the center of attraction.

By this time I had read everything available concerning my favorite breed of chickens and I enjoyed studying them from every point of view. I learned to know the Standard size of Langshans, which are 7½ lbs. for hen, 6½ lbs. for pullet, 9½ lbs. for cock, 8 lbs. for cockerel. This is now my 21st year with Langshans, and long ago I left the Standard of Perfection where it was, and went on my way rejoicing, quite determined to increase the size. Carefully I selected for mating, to build up my flock for meat, as well as for eggs.

Now to mate my birds. I select a cock not less than 10½ lbs. in weight, and this season I have one to tip the scale at 11 lbs. I am curious to know how large you can breed them and do not believe I have reached the limit as yet. People around here refer to my birds as "Black Turkeys." I insist on calling them Langshans, although some judges declare I have too much chicken. Nevertheless they are the true type of Langshans from northern China.

It might be well to relate a little of the history of this breed. Their native home is China. They derive their name from that territory, which is in the extreme northern part of the Chinese empire. The winters are much more severe there than in the United States. According to history, Langshans have existed in their purity for centuries. They are often referred to as "throughbred." They look the part, for a healthy Langshan is lordly and majestic in his appearance. His artistic beauty appeals to the fancier. Much has been said about the breeders of fancy poultry and their success in introducing birds that are beautiful in form and color.

The Langshan is not a modern "made" breed, and its long line of ancestry is a valuable asset. My enthusiasm has developed a long with my husky little flock, and I want to give them the credit for keeping me young, even thought I am grandma twice.

Although a fancier of Langshans, it is true when I say I don't keep them, for they keep me. To my mind the only practical way of handling any variety of poultry is to first select your choicest birds, then stick like a porous plaster to them, making a study of them from every angle. Keep a record up to date.

With my little flock of birds, our table is well supplied at all seasons of the year. My aim is to keep no loafers in the family, as well as none in the poultry yard. Just as soon as a hen becomes broody in the cooler she goes. This is made of a wire cage with a slat bottom. It hangs about 4 ft. from the ground with a single wire attachment. The air has free access, and the movement of the birds keeps the cage in motion. With the other birds singing and scratching beneath the prisoners it does not take them long to forget the desire to set, and after a couple of days they are released and are soon all back on the egg job once more.

I keep dry bran, oyster shells, char-

A Farm Flock of Black Langshans.

These photos show how the "All built" CANDEE sections are placed in position. Because of accurate construction, each section drops into line and fits perfectly.

COMES "ALL BUILT" —READY TO SET UP

The Candee comes to you completely constructed, ready to set on its legs—an operation as easy as setting a table on its legs. No costly labor, board or carfare expense getting men from the factory to install.

Candee Incubators come in all-built 600 eggs sections, each section made up of two 300 egg compartments. Additional sections are added as easily as attaching sections to a bookcase.

SECTIONAL—IN CONSTRUCTION —IN OPERATION

Candees are not only sectional in construction but in operation. Each section will come to you complete with piping, partitions and its own automatic regulators, etc. Hatches can be started at any time in any compartment independently of the other compartments.

The temperature in each hatching compartment is controlled by an automatic regulator while another automatic regulator controls the drafts on the heater and the water temperature.

This exclusive, patented, double automatic heat control gives double protection against overheating and chilling; while its perfected ventilating system assures sufficient oxygen without taking from the eggs their original moisture.

Send for your copy of the big, **FREE** Catalog that tells in detail the many advantages of the CANDEE INCUBATOR, with pictures of successful poultry farms in every part of the United States and Canada.

YEARLING HENS and MATED PENS FOR SALE
Glenn A. Wilson Box 10 Sandwich, Ill.

coal, grit, and plenty of water before the layers at all times.

The morning meal consists of table scraps and potato peel from the day before, cooked tender with a turnip or two, and thickened with bran and popcorn. Every two weeks I add to this mixture one heaping tablespoonful of Epsom salts to each two dozen hens.

At noon I give a dry mixed feed, such as oats, barley, wheat and popcorn also a pan of sugar beets uncooked but run through a common food chopper, using the largest cutting knife.

At night plenty of whole grain corn. This gives warmth to the body, and after a cold winter night they are back on the job with the usual amount of pep.

I feed all the sour milk I can get, both plain and mixed with bran. In the late summer I put the garden in turnips and late sugar beets. Late in the fall these are gathered and stored away in the cellar for green feed for the chickens during the winter months. They also have a lot sowed in alfalfa to run on in the winter and one reserved for the early spring.

Our little city of Eureka has a picture show, and the manager runs a popcorn machine. I engage all the refuse popcorn from him and find it of great value to the laying hens. It helps to give that variety of feed which is desirable for year-around layers. To my way of thinking the use of Epsom salts is one of the greatest secrets in poultry culture hints. I have used it for years, and get eggs while my flock remains in excellent condition.

Water is also a factor in egg production. A laying hen may consume 8 ounces of water daily, which means one gallon daily for 16 hens. From the hen's viewpoint, water is worth just as much as feed, for she cannot make an egg with either one alone. The fancier who furnishes high-priced feed and neglects the simple water supply, is making a mistake, and will reap the results with a limited egg yield. The water supply should be plentiful at all times, kept in a cool place in summer and kept warm in the winter. Replenish the water frequently in very cold weather. Ice water necessitates that the body burn more feed to maintain body temperature. For this reason I advise warm water in the winter. I have a hen 3 years old with a 260-egg record. I shall keep her as long as she lives. Last October I had 20 hens to lay 340 eggs, which sold at 53c a dozen. In November they layed 321 eggs which sold for 67c a dozen. In December they layed 311 which sold for 70c.

Some varieties of poultry give their heaviest egg yield when eggs are cheap. Black Langshans in common with other big breeds fill the egg basket to full capacity during the winter months.

The question has often come to my mind: Why is it that Langshans with their wonderful winter laying qualities as well as excellent table qualities are not bred more extensively, and why new poultry breeders seldom have the opportunity to read an article on them? Perhaps it is because new customers balk at white skin, black legs and pinfeathers. These pinfeathers remind me of a little story true to life. An old colored mammy was blessed with two sons, one a very black little fellow, the other several shades lighter. The lads coming in from play were somewhat dirty, and

poor, overworked mammy disgustedly said: "I nar did like at er child Rastus, cas de dirt always shows." Dear readers, this brings out the point that it is true that black pinfeathers in a white skin are prominent and always show, while if they were several shades lighter, you would overlook them, and perhaps devour them unknowingly. As for me I prefer seeing them.

I have found common sense and good hints to be the stuff on which success is built. The fancier who spends the greater part of his profits experimenting on undeveloped ideas gains nothing. What we need for bigger values are all the simple little helpful information, and then the practice. The person who starts in the poultry business entertaining the thought of steering clear of a little dirty work, unless he has a barrel of money, had better stay out and save himself disappointment. Poultry even on a small scale is like some other things. First of all you must like the business. If you like it you will scratch just as hard as you expect the hens to work. For 20 years I have scratched on an equal with my faithful old blacks. But withal, I have learned to make poultry keeping a pleasure instead of a drudgery. If you do your part most any Standard breed of poultry will pay. The only thing better than Langshans is more Langshans.

Kans.

Mrs. L. G Van Voorhis

Farm Hens That Scratch.

(Continued from page 883)

is the practice of hogging down corn in the fall. This is said to be a highly profitable practice and saves the labor of the two operations of husking the corn and feeding the hogs.

Allowing the hens to scratch up the corn as it comes through the ground or to eat off the wheat before it gets started in the spring is also a labor-saving operation, but there is some doubt as to the profitableness of the practice in the minds of those who have seen it in actual use.

The fact that the cow can live on grass alone during the summer months is no sign that the hen can do the same thing, as the digestive system of the hen requires that she be fed a concentrated ration and she is not equipped to handle large quantities of roughage. The nutritional requirements of the hen are somewhat similar to those of man, and though greens are plentiful during the spring months very few flock owners would like to be fed on nothing but greens, so the hen can scarcely be blamed for scratching at the wrong time and in the wrong place if her usual rations are not supplied during the summer as well as at other times of the year.

Why Not Broilers and Roasters, Also?

"Why not add a description of a poultarde as well as a description of a capon to the Standard?" asks Henry Turck. He further says: "A buyer of table poultry in New Orleans will pass up a capon any time for a poultarde."

Edward Brown, writing of winter fowls in France, says in his new book, "Poultry Husbandry": "Most of the cockerels are caponized, but the perfection of flesh is the French poultarde—that is, a pullet which has never laid an egg."

Cull and cull again and again until you have nothing but the very best for breeding even if only one pair.

The Louse Killing Poultry Perch

Kill 'em While You Sleep

A really wonderful thing. No use of using up your energy, time and expense, fighting lice, when our perch does all that for you. Mercy no! You don't have to spray, trap dust, dip or whitewash for them. Only five minutes work every six weeks, positively does the work. Your money back if it don't. A clean bunch of poultry and a clean house. We make poultry perches exclusively.

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

My Poultry Farm.

First Prize Article.

As every poultry farm has to be managed according to its location, kind of produce and other factors, let's first of all picture a one-man commercial poultry farm located in Vermont, a short distance outside of a hustling town of 8,000. Will say that this farm consists of 30 acres of sandy loam soil with 10 acres in pasture and woodland, and 20 acres of good tillage land sloping gently to the southeast. On this farm is kept about 800 to 1,000 mature fowls.

There is an excellent modern house on the place, and the lawns and surroundings are very attractive. The farm being on a main road and near a village, the passersby comment upon the neat and attractive appearance of the place. Situated not far from the house is a well-built barn, in which 2 cows, feed, brooder stoves, hoppers, fountains, etc., are kept. The layers are housed in two long 20x100 ft. houses, and three or four 8x8 ft. houses are used for pedigree matings. Four 10x12 ft. houses are used for brooding and Newtown coal-burning brooders are used exclusively. A 4,800 egg, mammoth incubator is run in the cellar of the house.

A good many people overlook the importance of having a name for their farm, and having this name used on their stationery, egg cases, etc. A well-kept place with a neat, attractive sign with the name of the farm on it, placed near the road side is bound to catch the public's eye and bring in trade. It may look unimportant, but it will surely save a lot of advertising. We'll say that this place is called "Bonnymead Farm." Only one breed of fowl is kept, and this farm has heavy laying strain of S. C. White Leghorns.

Now, having the location and equipment of this farm in mind we'll go on with its management. First of all egg production is the primary object, with broilers, hatching eggs, baby chicks, etc., to sell in season. A rather definite plan of breeding is practiced on this farm. Vigor is the first consideration. A bird that has been sick or backward in growth at any time is never used in the breeding pen. As soon as an inferior bird is seen a red leg band is placed on her and she soon visits the killing room. About February 1 the pullets are gone over and those showing indications of having laid heavily during the late fall and winter are marked. Then, if these marked pullets do not molt till September or October and have shown good production during the spring and summer we have our breeding stock selected without trapesting. Culling is practiced at all times, however. The very best layers are mated to selected males and these matings are used to produce males for breeders.

On this farm about 1,500 chicks are raised each year. They are brought out in two lots, the first one of 500 chicks about March 15, and the main lot of 1,000 about May 1. Sour milk is given the

first four weeks, and longer, if obtainable. The first two weeks they are fed chick feed in the litter four or five times a day and made to exercise as much as possible. On the third day bran is placed before them for an hour in the morning and afternoon. And on the seventh a chick mash is substituted for the bran; the chicks are fed chick feed three times a day and the mash left before them two hours in the morning and afternoon. After the second week the mash is before them all the time. Beginning with the sixth week scratch feed gradually replaces the chick feed, and a growing mash is used instead of the chick mash. This growing mash is composed of 300 lbs. bran, 100 middlings, 100 ground oats, 100 corn meal, and 100 lbs. of meat scraps. By this time part of the chicks are put into roosting coops, while others are kept in the brooder houses after the stoves have been taken out and roosts put in. The males in the first lot of chicks are sold as broilers during May, while the males in the later hatch are culled carefully and the inferior ones sold while the best ones are raised and sold as breeders.

The first lot of pullets begin to lay in August and September and help to hold up the egg level when the hens begin to decrease in production. These pullets come into laying quarters in good flesh and are fed quite heavily on scratch feed and just enough mash is fed to maintain a fair egg production. By this method fall eggs are received and the pullets maintaining their flesh seldom experience the fall molt. The main lot of pullets begin to lay during October.

It has been found that by feeding wet mash once a day in addition to the regular feed the old hens held up their normal production a month or two longer than if simply dry meal and scratch feed was fed. During July, August and September a mash of equal parts bran, middlings, gluten, ground oats, corn meal and meat scraps was fed wet to a crumbly state every morning. Just what could be cleaned up in 20 minutes. Green feed was given at noon and 6 lbs. of scratch feed to every 100 hens at night. The above mash was kept dry before them in hoppers at all times. By this method a 40 per cent production was kept during August and part of September.

The feed market is constantly kept in touch with, and oftentimes a lot of feed, as shrunken wheat, is bought at a bargain. All feed is home-mixed, the only commercial feed used being chick feed. Between an acre and two acres of flint corn is raised each year, thus producing about 4,000 lbs. of shelled corn, and the corn husks are used with straw for litter. The green food is raised on the farm in the form of mangel beets.

Some eggs are disposed of in town to regular customers while the rest are sold to a commission firm. Between 5,000 and 7,000 day-old chicks are sold each spring.

This farm is a firm believer in artificial illumination. The past two years

WYCKOFF'S S. C. WHITE LEGHORNS

AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain—unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that the WYCKOFF LEGHORNS have been, wholly or principally, the foundation of practically every successful Leghorn farm in this country for years. This is particularly true of the flocks making the most wonderful records.

HIGH QUALITY BREEDING COCKERELS

We are now offering the most exceptional lot of early hatched breeding cockerels it has ever been our good fortune to produce. These birds are all from a special selected lot of two-year-old hens of fine type, large size and wonderful layers. They are of a quality unequalled. Greatly increase the value of your present stock by purchasing some of these grand males for your next season's breeding—cockerels of this, the oldest established strain of Leghorns, and recognized by all poultry authorities as the best.

A limited number of fine selected yearling breeding hens and yearling cocks of equal grade left to spare. No more pullets of any age at any price this season.

OUR PRICES, CONSIDERING QUALITY, ARE EXCEEDINGLY LOW

Remember that we sell only QUALITY stock such as we would use for our own breeding. No second grade or bought up junk handled at any price.

As we are never fully able to meet the demand, advise that you place your order early. Send for free catalog giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country.

FEED SPROUTED OATS

The Best Green Feed Have Three Eggs Where
You Had Only One Before

Feed Sprouted Oats

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1921 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" GRAIN SPROUTER

Practically All Steel—Made in Sections

With New Safety Lamp—Safe in Any Part of House or Barn

Double steel walls—metal trays. Cannot be compared to wooden sprouters. Warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold. Glass doors. Each section a separate compartment. Start with enough sections for your needs and add more as you need them. Here is a money maker. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day increases the egg yield, cuts feed cost one-third. Write for full details. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cts. Write today.

It Takes Feed and Water to Produce a BIG EGG YIELD

Too many poultrymen think of feed alone, not realizing that water, which costs nothing, is equally as important as the costly grain. Laying hens must have water—a steady, clean supply at a comfortable temperature. Without it they cannot lay, and make losses instead of profits.

At the Missouri Poultry Experimental Station, it was proven by actual tests that fowls—any variety—fall off 50% in egg production when watered once a day as compared with those having water continuously. Think what it would mean to double the egg production of your flock with eggs at present prices! You can do this with less labor by using Norwich Automatic Air-Locking Fountains than by watering once a day.

Your birds will drink from four to ten times more water with the chill removed, and that means eggs! This wonderful Norwich Appliance provides a continuous supply of clean water with the chill removed at any temperature. It has been operated in Alaska at 60 degrees below zero! Safe—inexpensive to operate—positive in action—simple in construction—nothing to get out of order—a time, worry and labor saver.

Of course grain is necessary, and it's too valuable to waste or feed to mice, rats and sparrows. Put the scratch feed in Norwich Automatic or Apaco Feeders and prevent all waste—save labor—reduce feed bills 25 per cent—exercise your birds—get more eggs. Careful tests show that Norwich-fed birds average 20 eggs per year more than those hand fed by experts. A test with your flock will prove this.

Poultry plants all over the country are being equipped with artificial lights to increase winter laying. The plan works. We know because we've been using it on a large scale for several years. This winter we shall have 4,000 Layers under lights. But take our advice!—equip your lighted pens with non-freezing fountains and automatic feeders. Without them the system does not work to full advantage.

You're interested, of course. Get the full story. Write us today and we will supply—free—full details of these wonderful machines which help you to make your hens lay and pay.

John H. Vondell.

Preparing Pullets for Egg Production.

Second Prize Article.

It is only a short time before the pullets will begin their first laying year, so a little extra care now will fully repay the poultryman in eggs this winter. Try to start the pullets laying in October as earlier laying might bring on a moult, while if they do not start before cold weather sets in, laying may be delayed until early spring. If properly raised the mediterranean breeds start laying between five and six months of age and the American breeds between six and seven months of age.

Move the pullets to their winter quarters at least two weeks before they are expected to lay as a change during the laying period would mean a drop in egg production. Pullets raised on free range are likely to be wild when first yarded. The attendant should be careful when entering the pens and houses not to frighten the fowls uselessly.

Try to gain the confidence of the pullets by letting them eat from your hand. Do everything possible to make the fowls contented and their quarters comfortable. Other things being equal a contented pullet is always the best layer. Idleness is sure to breed bad habits, so keep the fowls busy scratching in a deep litter and jumping after some green food hung up by a string or net bag.

To lay heavily all winter a pullet should have a supply of surplus fat to start with. This surplus fat can be added by feeding more corn and grain food and cutting down the supply of mash for a little while just before the pullets begin to lay. Keep oyster as well as grit and charcoal before the pullets, as they will soon need lime to make egg shells.

The nights are getting cooler and there is little danger of the fowls suffering from heat unless they are overcrowded. If the houses are crowded by all means cull out the less developed pullets. In order to avoid fall colds, it will be safer to close the west, north, and east sides of the poultry house, leaving a large opening in the south side, and by all means make the roof waterproof.

Stamp out disease by keeping the yards and houses clean and sanitary. Keep the fowls and houses free from lice and mites by the continual use of a good lice powder and coal tar spray. If these few suggestions are followed, the pullets may be expected to do their duty faithfully through the winter.

Texas.

James M. Potter.

Inbreeding.

Extremely close inbreeding such as the mating of father and daughter, mother and son, or own brother and sister is often called in-and-in breeding. Line breeding is a form of systematic inbreeding within one strain or family where the effort is made not to inbreed too closely. Line breeding is almost universally used in some form by successful poultry breeders.

Awards at New York State Fair.

(Continued from page 880)

[Addresses of all exhibitors are given at least once. Where address does not appear, it will be found further up in awards on some preceding variety.]

Dark Barred Plymouth Rocks—Eugene F. Paige, Ogdensburg, N. Y., 1-3 cock, 2-4 hen, 2 ckl., 1-3 pl., 1 old pen, 2 young pen; Etion Farm, South Vineland, N. J., 5 cock, 5 hen, 5 ckl., 1 young pen; L. B. Resseguie, Millers, N. Y., 4 cock, 4-5 pl., 2 old pen; John E. Scudder, Centerport, N. Y., 3 hen; Dr. Donald Parker, Syracuse, N. Y., 1 hen; R. R. Hickson, Cherow, S. C., 1-3-4 ckl.; Chas. H. Houshultes, Hamburg, N. Y., 2 pl.; P. Canavan, Philmont, N. Y., 3 old pen, 3-4 young pen; Edw. E. Smith, Rome, N. Y., 5 young pen.

First cock, not overly big, but an even colored fellow, of blue tone, with the same width and quality of barring all over. Second hen of same quality, with yellow shanks of exhibition hen. First hen larger, little darker in shanks; straight, even barring, with snappy dark bar. Second cockerel still heavy in chick feather. First cockerel big, but will hardly make such a cock as first. First pullet, big; strong in dark bar, clean in light bar. Second pullet, trifle wider, white barring in lower breast and top of shoulders, failing to winner in consistency of barring in all sections.

Light Barred Plymouth Rocks—Eugene F. Paige, 2-3 cock, 2 hen, 1-3-4 ckl., 1 pl., 2 old pen, 2 young pen; Chas. H. Roushultes, 5 cock, 5 young pen; Etion Farm, 1-4 cock, 1-5 hen, 1 old pen, 1 young pen; John E. Scudder, 3 hen; L. B. Resseguie, 4 hen, 5 ckl., 3-5 pl., 3 young pen; Howard E. Hettrick, Elizabeth City, N. C., 2 ckl., 2 pl.; H. H. McGill, Columbia, S. C., 4 pl.; Wm. S. Huckle, Waverly, N. Y., 4 young pen.

First cock, fine proportions and shown in good condition. Second, not in as good feather, or as smooth fold of wings. First hen, an even barred hen, very clean in white bar. Second hen, splendid Rock type, same straight clean barring as first, but fails to winner in comb. First cockerel, narrow barred, blue bird. Second lanky, short in feather, needs time. First pullet, nice type and color. Second smaller, long in head.

White Plymouth Rocks—Joseph Chadwick, Newburg, N. Y., 2-5 cock; Wilburtha Poultry Farms, Trenton Jct., N. J., 1 cock, 1-2 hen, 1-2-3 ckl., 1-2-3-4 pl., 1 old pen, 1 young pen; W. C. Ryan & Son, West Webster, N. Y., 3 cock, 3 hen; Allan J. Grauer, Niagara Falls, N. Y., 4 cock, 5 hen; Chas. A. Schmaling, Port Chester, N. Y., 4 hen, 4-5 ckl., 5 pl.; Alexander James, Syracuse, N. Y., 2 old pen; H. A. Borgeldt, De Ruyter, N. Y., 2 young pen.

First cock, wonderful head, great body, not yet in full feather, but cocks are the hardest to get right for an early show. A judge who appreciates a wonderful bird of this kind knows quality. Second cock, similar to first, but not quite the same satin texture to individual feathers that gives first earmarks of a grand thoroughbred. Other cocks out of the class. First hen, wonderful; correct back, tail, with beautiful rounded breast and underbody lines, shown in super condition. Second hen, close runner up, trifle fuller in fluff. First cockerel, big, well grown, typical of the best eastern productions in the variety. Second equally good length, but lower set. First pullet, evidently laying; 2d, great length, fine station to make great hen; little younger than winner.

Buff Plymouth Rocks—Fred Armer, Ballston Spa, N. Y., 2 cock, 1-4 ckl., 4 pl., 3 old pen, 3 young pen; Wm. Olliver, Jr., Barre, Vt., 1 cock, 1-2 pl.; P. W. Noyes, New London, Conn., 4 cock, 2 hen; Kingman Farm, Randolph, Mass., 3-5 cock, 5 hen, 4 old pen, 4-5 young pen; Nescopeck Poultry Farm, Nescopeck, Pa., 3 hen, 2-3-5 ckl., 3 pl., 1 young pen; H. Augustus Eiler, Syracuse, N. Y., 1 hen, 1-2 old pen, 2 young pen; John G. Linville, Urbana, Ohio, 4 hen; E. H. Lichtenwalter and J. H. Ellis, Girard, Pa., 5 pullet.

Marked advancement in Buff Rocks; strong class. First and 2d cocks, good birds, 2d being a little rich in color. First and 2d hens, big, strong pair. First cockerel, good substance of body, welcome change from narrow bodied, leggy cockerels that used to appear at this early show. Second cockerel, little more station than winner, good back. First and 2d pullets, clear buff, clear tails, nice bodies.

Silver Penciled Plymouth Rocks—John L. Mitchell, Cambridge, N. Y., 2 cock, 2 hen, 4-5 ckl., 3-5 pl., 1 old pen, 1 young pen; Oak Hill Poultry Farms, Montello, Mass., 1 cock, 1 hen, 1 ckl., 1 pl.; John G. Linville, Urbana, Ohio, 3 cock, 3 hen, 3 ckl.; Clyde H. Swan, Barre, Mass., 2 ckl., 2 pl.; John T. Bird & Son, 4 pl.

Best class in years. First and 2d cocks, big, clear silvery top color; sound breasts;

Fresh Eggs Now Bring Big Money

Is there anything quite as appetizing as *fresh* eggs on a cold, crisp, winter morning? That's why consumers pay high prices for them during the months when egg-production is usually low. That season is at hand. Egg-prices are getting high—will remain so for several months.

This is your opportunity to make your flock make big money for you. The whole secret lies in getting your birds to laying steadily now and keeping them at it all winter. Thousands of money-making poultrymen do this every year. They use America's original and standard poultry tonic and conditioner—

Pratts Poultry Regulator

For fifty years the genuine "Pratts" has been making hens lay by naturally invigorating and strengthening them—by helping to protect them against common diseases—by putting them in *condition* to lay.

Begin using it at once—*today*—and see how your flock "picks up"—how soon the molting hens get their new plumage—how quickly the pullets develop and begin laying—how the empty nests fill up. Don't say "It can't be done." It can! You can do it. Just test Pratts Poultry Regulator *at our risk*. If it fails to make your hens lay it doesn't cost you a cent.

Save money! Buy Pratts in 12- or 25-lb. pails, 50- or 100-lb. bags.

And protect your flock against epidemics of roup, colds and other similar troubles that appear during changeable fall weather. Use a solution of

Pratts Poultry Disinfectant

to kill the disease germs if they appear—to keep the poultry houses and equipment in sanitary condition. Pratts Poultry Disinfectant is at once safe, efficient, and economical. A single gallon makes a barrel of powerful solution. You can afford to use it regularly and freely. It pays!

Sold under this square-deal guarantee:

"Your Money Back if YOU Are Not Satisfied."
You can NOW buy "Pratts" at pre-war prices.

METHUEN, MASS.

The Dawn of a New

SUPER SOL

TRA
REGIS
U.S. PAT
MA

At Last I Have It!

For the past two or three months I have asked the readers of the poultry journals to watch for my 1921 announcement of the new improvements I had to offer on my already famous Sol-Hot Heaters for brooders and incubators. Ever since I first brought out the Sol-Hot Heaters which proved to be such a vast improvement over anything on the market, I have worked persistently to make it better and better each succeeding season. My aim has been to make it absolutely automatic. At last I have succeeded and that is why I have re-christened it the Super Sol-Hot.

If you can imagine the ideal satisfaction of simply striking a match, lighting the burner and having a heater that requires nothing but keeping a supply of oil in the glass reservoir — a burner that won't go out, won't overflow, one that is positively dependable and automatic, you have in a "nutshell" the wonderful advantage of a SuperSol-Hot.

My new Super Sol-Hot Heaters are made in 5 sizes, suitable for small brooders and incubators from 60 egg and chick sizes to 3000 egg and chick outfits. My

Giant Sol-Hot is especially fitted out to fit any coal burning stoves, to do away with gas, ashes and the unreliability of coal stoves.

The danger of flame going out and oil overflowing on floor and litter is positively overcome. This for safety alone is sufficient to make the Super Sol-Hot preferable.

Once the Super Sol-Hot is lighted, no further attention is necessary. The flame burns steady all the time. To increase or decrease the size of the flame you simply raise or lower the oil container; turning the oil container to the left raises it and correspondingly increases the flame, while turning to the right lowers it and correspondingly reduces the flame. The lever underneath the oil container locks the container in position after the adjustment is made. The action of the automatic control is positively infallible. It is just as certain to act as water is to flow down a grade.

All Metal Vaporizer

All Metal Vaporizer The All Metal Vaporizers used only on Sol-Hot Heaters is a distinctive advantage. This patented device takes the place of the old fashioned wicks and asbestos ring vaporizers which cause so much trouble and annoyance. It does not carbonize like wicks and asbestos rings. It burns a steady flame all the time. It does not smoke or give off fumes. Asbestos ring vaporizers can be used on the Super Sol-Hot Heater if desired, but we don't recommend them, because the metal vaporizer is so much more satisfactory. The only reason metal vaporizers are not used on other heaters is because our patents not only cover the Metal Vaporizer which is a part of the heater, but the Sol-Hot Canopy Brooder as well.

Era for Poultrymen

SOL-HOT HEATER

SOL-HOT Canopy Brooder

SOL-HOT Canopy Brooders

Sol-Hot Canopy Brooders heated with the new Sol-Hot Heater makes the ideal combination for the poultry raiser. This outfit enables you to raise your young chicks without care or worry. You don't have to lay awake nights, wondering whether your brooder heater has gone out or whether you have adjusted it alright so it won't

smoke. Always the same steady heat. You can depend on it day in and day out. Sol-Hot Canopies are furnished in three sizes—32, 42 and 52 inches in diameter.

Baby SOL-HOT Brooders

To meet the requirements of the back lotter, in fact anyone who buys chicks in small lots, we designed this ideal Baby Sol-Hot Brooder. It is the same as others, except the oil reservoir, which is smaller. The Canopy is 22 inches in diameter. It is an ideal brooder for small breeds and will prove a most gratifying outfit for those who only raise a few chicks each season. Both Heater and Canopy shipped in one strong wooden crate. All ready to set up and operate.

Write for my new catalog folder giving full detailed descriptions and illustrations of this wonderful new Super Sol-Hot. This new folder explains how I have accomplished the many improvements which assure its dependable efficiency. Also illustrates and describes the famous Sol-Hot Canopy Brooders. Also my new Sectional Multi-dek Incubators. This new catalog folder mailed free

on request. Send for it today and learn about the recent, newer and better equipment for poultry raisers.

Word to Dealers

The New Super Sol-Hot is the biggest improvement in brooder and heating systems ever offered to the poultry public. Our big advertising campaign, of which this ad is a sample, will continue to acquaint poultry raisers everywhere with the superiority of the Super Sol-Hot. Arrange **now**, without delay, for your allotment of Heaters and Brooders. This is going to be a big year for Sol-Hot dealers. (19)

MEAT SCRAPS Triple Egg Yield

In a two-year feeding test by Purdue University, it was shown that 30 birds fed meat scraps in the ration averaged 179 eggs per year; while 30 birds fed exactly the same ration but without meat scraps averaged only 59.35 eggs per year. It was further shown that the presence of Meat Scraps in the ration increased the efficiency of the other feeds; that every 100 pounds of Meat Scraps fed produced \$52.57 worth of eggs (average price of eggs, 46¢ a dozen). Test shows that Meat Scraps are cheap at 6¢ a pound as compared with no meat scraps.

Figure Your Profit

These figures speak for themselves. Figure the profit that you can make feeding Meat Scraps to your fowls. You can't neglect this valuable and economical source of animal protein. Insist on

trimmings of highest quality from Government Inspected Meats. You need "MAGIC" Meat Scraps now. Order direct from this ad. Your order shipped—by freight—same day received. Price 100 pounds \$3.25. Write for Free Booklet on High Egg Production. Send your order today.

805 Exchange Ave. CHICAGO, ILL.

good type. First cockerel, no little peewee; big, good substance. First, 2d pullets, well grown, nice heads and type, particularly sound penciling on 1st. As hens, these pullets another year will excel the 1st and 2d hens. The variety appears to be advancing.

Partridge Plymouth Rocks—M. N. Adams, Kenwood, N. Y., 2 cock; W. Crandall, Syracuse, N. Y., 1-4 cock, 1-2-3-4 hen, 1-2 old pen; Newton Ward, Fulton, N. Y., 3 cock; John T. Bird & Son, 5 cock, 5 hen, 5 pl., 1 young pen; Harry Katzen, Sykesville, Pa., 1 ckl., 1-2 pl.; W. R. King, Tully, N. Y., 2-3-4-5 ckl., 3-4 pl.; A. C. Wheeler, Millbrook, N. Y., 2 young pen.

Compared to other shows, a big, strong class. First cockerel, a live tone of color; 2d dead on wing bows and deficient in saddle striping. First and 2d hens, big; long body, excellent penciling on a clear ground. Elegant snap and fine definition to pencils on 1st pullet, and rich ground color. Second fails in penciling, in flatter tone of ground color, but good type and a winner in most other competitions.

Columbian Plymouth Rocks—James F. Harrington, Hammon, N. J., 1-4 cock, 2-4 hen, 2-4 ckl., 2-4 pl., 1 old pen, 1 young pen; Harry L. Phillips, Bone Terre, Mo., 5 cock, 5 hen, 3-5 ckl., 3-5 pl.; Henry L. Wilbur, Tiverton, R. I., 2 cock, 1 hen, 1 ckl.; C. D. Shaff, Syracuse, N. Y., 3 cock, 2 young pen; John G. Linville, Urbana, Ohio, 3 hen; F. W. Spalding, Poulney, Vt., 1 pl.

Some comment on placing of 1st and 2d cocks. Right either way. Second, better feather; black on breast in front of shoulders; heavy saddle lacing. First, cleaner marked bird, tail in molt, and one lesser sickle shows some white on base. Critics fail to note that this feather could have been pulled, and when tail is in full feather, would not be too conspicuous. First hen, big, too gray in color; 2d, good type, white body; sound black markings; striping not well edged around in lower hackle. First cockerel, big; good body, nice black markings; head too round and small for Rock; tendency to straw color on top. Second, younger, with the making of a fine bird. First pullet, white surfaced body, laced tail coverts, clean, strong striping in neck and around under throat; good body and type. Second, another big pullet, good head, little gray in tail coverts, neck striping black but fails to winner under throat.

Silver Wyandottes—W. E. Samson, Kirkwood, N. Y., 1 cock, 5 hen, 1 ckl., 1 pl., 2 young pen; Allen Blodgett, Cobleskill, N. Y., 4 cock, 4 ckl., 3 pl., 1 old pen; Dr. H. R. Bristol, Bennington, Vt., 3-5 cock, 1-2-4 hen; L. V. Clark, Jefferson, Ohio, 2 cock, 3 hen, 2 ckl., 2 pl., 1 young pen; W. C. Box, Lynbrook, N. Y., 3 ckl., 5 pl.; G. A. Petts, Massena, N. Y., 5 ckl., 4 pl.

First cock, good bird. Other males excel in certain sections, such as sounder edging in breast lacing; but 1st cock is in good feather and best all round bird. Second cock, fails to winner in shape; a remarkably clean colored bird, narrow lacing on wing bars; evidently an outstanding breeder of lacing. Some ordinary quality in hens. First has rather old fashioned centers. Second hen, good head, pretty fair lacing, but upper breast feathers are not edged clear around. Cockerels still need little age to clear up. First pullet, best lace properties in class.

Golden Wyandottes—John Rinehard, Oneida, N. Y., 4 cock; Melvin F. Uphob, Bound Brook, N. J., 1-2-3 cock, 1-2-3 hen, 1-2-3 ckl., 1-2-3 pl., 1 old pen, 1-2 young pen; A. P. Meyers, Mohawk, N. Y., 5 cock.

First cock, splendid condition; bright top color; great fluff lacing; good Wyandotte body. First hen, nicely laced, free from mossiness; 2d hen, similar type and color, but shorter in feather. A great team of hens. First cockerel, young; 2d, farther along in development; evident good breeding here. First pullet a beauty, big, rich ground color, open lacing clear into fluff. Second pullet, another great bird, trifle smaller than winner but even better type; rich even ground color; sound lacing.

White Wyandottes—John S. Martin, Port Dover, Ont., Can., 1-2-3-4-5 cock, 1-2-3-5 hen, 1-2-3-4 ckl., 1-2-3-4-5 pl., 1-2-3 old pen, 1-2-3 young pen; J. J. Lynch, Westport, Conn., 4 hen; O. P. Keator, Cortland, N. Y., 5 ckl.; P. C. Thomas, Rome, N. Y., 4 old pen; A. W. Dakin, Syracuse, N. Y., 4 young pen.

Some good and some poor in competition with Martin, who won strongly and on merit. First cock, a great Wyandotte, typical Wyandotte head, well proportioned body, splendid condition of plumage and white. A grand showing of cocks in Martin's line: close competition from 1st to 5th, and if 5th was little further in tail molt, he would have changed the line-up back of 1st. First and 2d hens, great Wyandottes, great type and white as driven snow. First cockerel not only had the quality but was ready. Second another

big, well grown bird. Third another wonderful cockerel. Fourth not quite as far along as other three, but a bird of wonderful bone, head and body type. With more age will make as fast a cockerel as ever stood in Syracuse. First and 2d pullets the best pair we ever saw in an early show. These pullets are just about the ideal; you can specify everything a Wyandotte should have and find it in the first pullet. If anyone thinks it is easy to win heavily at Syracuse year after after, as Martin has done for 16 years, let him try it; he will soon look like a battered warrior, gray hair, with a wooden leg.

Black Wyandotte—John G. Linville, Urbana, Ohio, 2 cock, 1 hen; Sunnyside Farm, Syracuse, N. Y., 1 cock, 2 hen; Geo. A. Montgomery, Cambridge, N. Y., 1 pl.

Buff Wyandottes—G. Arthur Cook, Easthampton, Mass., 2 cock, 1-2 hen, 2-4 ckl., 1-2-5 pl., 2-3 young pen; Andrew Riddell, Greenwich, N. Y., 1-3 cock, 2-3 old pen; S. A. Howland, Granville, N. Y., 4-5 cock, 5 ckl., 3 pl.; J. J. Dansor, North Caredon, Vt., 3-4-5 hen, 1 ckl., 1-4 old pen, 5 young pen; John M. Roberts, Granville, N. Y., 3 ckl., 4 pl.; Edw. E. Jones, Granville, N. Y., 1 young pen; J. H. Clark, West Pawlet, Vt., 4 young pen.

A strong line-up of Buff cocks, with the first in good feather. Second, a fine shade of even golden buff, excellent condition; excellent in type. First hen, a great big hen of one shade of buff from back to breast and over fluff; unusual breeding material for the variety. First cockerel, built right, plainly grown right, with the right kind of color; trifle long in drumstick. Second cockerel a wonderful specimen, level color, broad tail, could exchange places with winner. Third cockerel, big, but hot color. Fourth, short of tail but a real one. A few unplaced cockerels fail in color of ear lobes. First pullet has everything. Second, little longer in back. No shafting or meanness in this pair; and no unevenness or patchy buff.

Partridge Wyandottes—Hubert L. Voorhees, Asbury Park, N. J., 4 cock, 4 hen; Sheffield Farms, Glendale, Ohio, 1-2-3 cock, 1-2-3 hen, 1-2-3 ckl., 1-2-3 pl., 1 old pen, 1 young pen.

More than once the 1st Partridge cock has been in the best feather of any cock at Syracuse. The outstanding winner this year was a worthy successor of the great line of predecessors; elegant type and style; bright yet rich top color; soundly striped. First hen had better penciling in fluff than many hens have on back. Penciling harder to get in pullets, and 1st star in pencils; fine Wyandotte type. First cockerel, well grown, and a choice one.

Silver Penciled Wyandottes—Oak Hill Poultry Farms, Montello, Mass., 1 cock, 1 hen, 1 ckl., 1 pl.; F. W. Rogers, Brockton, Mass., 2 cock, 2 hen, 2 ckl., 2 pl.

Not many but a distinct advance in quality.

Columbian Wyandottes—Willis Myers, Saugerties, N. Y., 2-3-4 cock, 1 hen, 2-3-5 ckl., 3-4-5 pl., 3 old pen, 1 young pen; Austin G. Warner, Whitesboro, N. Y., 1-5 cock, 4 hen, 1 old pen; Henry W. Polgreen, Albany, N. Y., 2-3 hen, 1 ckl., 1-2 pl., 2 young pen; Earl H. Brownell, Potsdam, N. Y., 5 hen, 4 old pen; Chauncey Smith, Vineyard Haven, Mass., 4 ckl.; S. S. Newton, Balston Spa, N. Y., 2 old pen.

Mixed quality in cocks, with the first bird in hard feather but good type; strong wing; nice striping and free from brass. First hen on the dark order, with nice type, hackle and tail coverts; good wing. First cockerel, a well built bird; good head and body; broad back and tail; good breast; silvery white top color; rather fine, not heavy, black striping; good wing. First and 2d pullets, white bodies, good heads, nice tail coverts and necks. First has Standard wing markings, trifle high in tail. Second fails slightly to winner in wing.

Black Java—Sunnyside Farm, Syracuse, N. Y., 1 cock, 1 hen; Hiram W. Schriver, Groton, Conn., 1 ckl., 1 pl., 1 young pen.

Mottled Java—John F. Bird & Son, 1-2 cock, 1-2 hen, 1-2 ckl., 1-2 pl., 1 old pen, 1 young pen; Sunnyside Farm, 3 cock, 3 hen.

Mottled Java females are darker, more on Ancona order; big advance over old splashed white and black, some of which used to look like first crosses.

Dominique—Eunnyside Farm, 1 cock, 1 hen, 1 pl.

S. C. Rhode Island Red—Rockefeller and Waggenblatt, New Haven, Conn., 4 cock, 5 hen, 1-5 ckl., 3-4-5 pl., 1 young pen; H. A. Borgeldt, De Ruyter, N. Y., 5 cock; Roswell Cole, Rhinebeck, N. Y., 3 cock, 3 ckl., 4 young pen; Owen Farm, Vineyard Haven, Mass., 1 cock, 1-2 hen, 2-4 ckl., 1-2 pl., 1 old pen, 2-3 young pen; Geo. W. Tracy, Kinderhook, N. Y., 2 cock, 2 old pen; Edward P. Tilton, Springfield, Mass., 3 hen; Sand Hill Farm, Huntington, N. Y., 4 hen, 4 old pen, 5 young pen; J. De Ver Rogers &

HAROLD TOMPKINS RHODE ISLAND REDS

Single and Rose Combs

Fancy and Utility Birds

FIRST PRIZE S. C. COCKEREL

The records of my birds in the show rooms throughout this and foreign countries furnish absolute proof that they stand supreme.

Show Birds

All of these birds are direct descendants of my famous winners and bear a striking resemblance to their great ancestors. I can select just the bird to help you win.

Breeding Birds

Cocks, Hens, early hatched cockerels and pullets that will improve your color and egg production. Now is the time to buy for early breeding.

Place your order at once.

Rare Bargains ∴ Closing Out Sale

This advertisement can interest only the person or breeder who knows what Purebred Poultry of the very first class should be. We offer the following for immediate shipment, every bird of them bred from 200 to 265 egg strains and many with records of their own:

450 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn females, 1 to 2 years old.

65 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn cocks.

200 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn pullets, 4 to 6 months old—many now laying.

85 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn cockerels, 4 to 6 months old.

We desire to close out this surplus stock, which does not contain culls, this month, and will make special prices for quantity purchases. Also for sale cheap—10 Section Candee Giant Incubator, complete, 6000 egg capacity, used two seasons. If interested in any of the above, address

MINORCAS—GIANT S. C. BLACK

My strain as usual are proving their worth from coast to coast. 1000 choice exhibition birds and breeders for sale. JOHN L. BROWN 65 Indiana Avenue ANDERSON, INDIANA

Son, Oxford, N. Y., 3 old pen; Newton Ward, Fulton, N. Y., 5 old pen.

First cock, big; long bodied; horizontally carried, which means legs in the middle, supporting a well balanced body; correct carriage of tail; good head; level color that is rich and deep; lustrous and full of gloss on top. Second cock, fails to winner in type. First and 2d hens, big, standing on strong legs; splendid bodies; both through the molt, with back feathers almost full size; a revelation to those who have visualized hens that held the wondrous color of pullets, with only a slight shading off in breast. Have to look twice to see it. First to 5th cockerels, big as winter show birds. First has deep, rich color, lustrous and level; good size and type. Second handicapped by missing point on comb. Fourth, same deep, lustrous red color as first, big and fully feathered; in fact, so big and long in back, sticks tail up a little; coop too small. Best class of pullets ever cooped at an early show. First evidently laying; 2d still coming with a trifle better station and length. Same level, rich red on breast as on back; hackles show breeding value.

No class in show with better development; no class a harder one in which to win. Honor to the men who are putting down the winners in such a class of S. C. Reds as cooped at Syracuse.

R. C. Rhode Island Reds—Edward P. Tilton, 1 cock; Wm. Elger and Ray Alexander, Auburn, N. Y., 3-5 cock, 1-4 hen, 1 ckl., 1-2 old pen, 1 young pen; China Hanchett, Syracuse, N. Y., 2 cock, 5 pl., 4 young pen; H. E. Humphrey, Greenwich, N. Y., 4 cock, 2 ckl., 1 pl., 2 young pen; M. B. Gould, Salem, N. Y., 3 hen, 3-5 ckl., 5 young pen; Dr. H. E. Cheesebrough, Greenwich, N. Y., 5 hen, 4 pl., 3 young pen; G. A. Durussel, Owego, N. Y., 2 hen, 4 ckl.; Wm. Lee Record, Fort Edward, N. Y., 2-3 pl.; John C. Vanderoef, 3 old pen.

Harder feather than in cocks last year when Rose Comb males were noticeably stringy. First cock, big; good type; not as well balanced and horizontal as 1st S. C. cock. Second, fails to winner in proportions of body and finish. Some hens that look almost too good to be true. First hen wins color special. First cockerel, good station; long body; level color; not quite the maturity seen in S. C. cockerels; however, few young birds in the show are better along. Second cockerel, another good one; body built like a brick and well carried. R. C. pullets, another wonder class; critical selection necessary to place the awards here. First big, strong, long bird. Second best head ever saw on R. C. Red; 3d narrow in comb. These pullets are one shade of red all over, including neck; there is life and luster to the plumage; they are big and well grown, with splendid type.

S. C. Rhode Island White—H. P. Phelps, Newrow, N. Y., 1-3-4 cock, 5 hen, 1-3-5 ckl., 1-3 pl., 2 young pen; Lyle M. Gifford, Oneonta, N. Y., 2-5 cock, 2-3-4 hen, 2 ckl., 4 pl., 1-2 old pen, 1 young pen; Stewart & Byble, Ossining, N. Y., 1 hen, 4 ckl., 2-5 pl. R. C. Rhode Island White—Stewart & Byble, 1-2-3 cock, 1-4-5 hen, 1-2-3 ckl., 1-2-3 pl., 1 old pen, 1 young pen; Lyle M. Gifford, 4 cock, 2-3 hen.

Some Rose Comb Whites of good type, but in picking winners judges should be instructed to emphasize type until typical R. I. Red shape is thoroughly established; then get other points. Enough good type in R. C. Whites here to pick leading winners as typical of the breed. The Rose Combs are much stronger in quality than the Single Combs this year; appear to be in hands of better breeders.

Buckeye—Sunnyside Farm, Syracuse, N. Y., 1 cock; Miss Genevieve Trevorah, Cornwall, N. Y., 1 ckl., 1 pl. An outstanding, level colored, good shaped pullet.

Light Brahma—Erskine T. Brown, Mountville, N. Y., 1 cock, 3-4 hen, 4 pl., 1 young pen; J. L. Wittman, Rochester, N. Y., 2 cock, 1 hen, 1 ckl., 2 pl., 2 young pen; Wm. F. Jennijohn, Rochester, N. Y., 3-4-5 cock, 2-5 hen; Edw. J. Hayes, Rochester, N. Y., 4-5 ckl.; James T. Baldwin, Syracuse, N. Y., 2-3 ckl., 1-3-5 pl.; J. S. Hawkins, Waco, Texas, 1 old pen.

Strong classes. First cock, clear top color, free from brass. Splendid size, true Brahma type and good color in 1st and 2d hens, the winner especially strong in tail coverts. First cockerel, unusually well developed for a Syracuse winner. First and 2d pullets very attractive, the winner being especially strong in white body with beautiful neck lacing and a luxuriant growth of very large, broad, finely laced tail coverts.

Dark Brahma—Dr. S. Lott, Waterloo, N. Y., 1-2 cock, 1-3 hen, 1-2 ckl., 1-2 pl., 2 old pen, 1 young pen; John G. Linville, Urbana, Ohio, 3 cock; Sunnyside Farm, Syracuse, N. Y.; 4 cock, 2 hen, 1 old pen.

First cock, 1st hen and 1st pullet tops of the class. Winning cockerel a baby.

Buff Cochins—Sunnyside Farm, 1 cock, 1 hen, 1 ckl., 1 pl., 1 old pen. Some nice Buffs. One hen in 1st pen especially good shape; nice round head; not long, flat skull; stringy in feather. First cock good.

Partridge Cochins—Sunnyside Farm, 1 cock, 3 hen; Dr. S. Lott, Waterloo, N. Y., 1-2 hen; L. L. Reed, Marathon, N. Y., 1-2 ckl., 1-2 pl.

White Cochins—Geo. A. Montgomery, Cambridge, N. Y., 2 ckl.; Sunnyside Farm, 1 ckl., 1 pl., 1 old pen.

Black Cochins—Sunnyside Farm, 1 cock, 1 hen, 1 ckl., 1 pl., 1 old pen.

Black Langshans—John L. Mitchell, Cambridge, N. Y., 5 cock, 3 hen, 1-3 ckl., 1-2 pl., 2 old pen, 1 young pen; E. J. Mesick, Ardley, N. Y., 4 cock, 2-5 hen, 1 old pen, 3 young pen; Fred E. Isbell, Saratoga Springs, N. Y., 3 cock, 3-5 pl., 3 old pen, 2 young pen; W. H. Craig, Bath, N. Y., 2 cock, 1-4 hen, 5 ckl., 4 pl., 4 old pen; J. F. Robinson, South Weymouth, Mass., 1 cock, 2 ckl.; Chas. D. Spencer, Glenoe, Ill., 4 ckl.

First cock, big; great station, back and tail. Second fails in size. First hen, fine condition; good head and type. First, 2d, 3d cockerels, big bodies on good station that only need time to grow more tail. First pullet all there; 2d pullet rangy in legs with good back and tail; needs a little more age to beat 1st.

White Langshans—John L. Mitchell, Cambridge, N. Y., 1-2 cock, 2-3 hen, 2 ckl., 1 pl., 1 young pen; John G. Linville, 3 cock, 1 hen, 1 ckl., 2 pl. Same attractive birds in this class, indicating revival of interest.

S. C. White Leghorns—Geo. B. Ferris, Grand Rapids, Mich., 2-5 cock, 3-4 hen, 5 pl., 1-3 old pen, 2 young pen; Wilburtha Poultry Farm, Trenton Jct., N. J., 1 cock, 2 hen, 1-5 ckl., 4 pl., 5 old pen, 3 young pen; Sunny Brae Farm, Port Dover, Ont., 3-4 cock, 5 hen, 4 ckl., 4 old pen, 4 young pen; A. & B. Schilling, Rochester, N. Y., 1 hen, 1-2 pl., 1 young pen; Roy S. Rider, Ballston Spa, N. Y., 2 ckl.; Wm. Shands, Little Blue, Mo., 3 ckl., 3 pl., 2 old pen; Underhill Poultry Yards, Hastings-on-Hudson, N. Y., 5 young pen.

Winter show quality in this class. A few cocks look as fresh as cockerels.

First, good head, body, and white as snow. Second finish like a cockerel. Third, not as good underline as 1st. First hen the best that ever won at Syracuse; good head and type and winter show condition. Second, a close runner up to 1st. Similar in type, fine comb; shade smaller than 1st. First cockerel, wonderful head; nice station; good back; well carried tail with broad lesser sickles. Second cockerel well grown and well finished, fails to winner in fine texture of comb, and a trifle in station. Third cockerel another grand big bird of good type; fails to 1st slightly in balance of comb. Fourth, blade of comb follows head. Some wonderful young birds in this class that give great promise for later shows. First pullet, right in the pink; same elegant type as 1st hen. Second, wonderful lines of breast, shoulders, back, tail; big without coarseness. Quality in every detail in this team of pullets. Fourth pullet on same order as 2d; make good hens. Third hasn't same underpinning but a very showy pullet.

R. C. White Leghorn—Louis H. Perry, Clay N. Y., 4 cock, 2-3 hen, 3 pl., 2-3 old pen, 3 young pen; Chas. H. Damon, Ballston Spa, N. Y., 1-3 cock, 4 hen, 1-2-5 ckl., 1-2-5 pl., 1 old pen, 1-2-5 young pen; Craig & Derrick, Bath, N. Y., 2-5 cock, 5 hen, 4-5 old pen; J. M. Chase, Walkill, N. Y., 1 hen, 3 ckl., 4 young pen; H. N. Deerland, Middletown, N. Y., 4 ckl., 4 pl.

First cock, hen and cockerel were the tops; with several choice ones under ribbons in pullets. A strong class with increasing interest in the variety among New York state breeders.

S. C. Brown Leghorn—Bert Fortier, Ogdenburg, N. Y., 4 cock, 4-5 hen, 4 ckl.; Albert G. Tilden, Fulton, N. Y., 1-2-3 cock, 1-2-3 hen, 1-2-3 ckl., 1-2 old pen, 1 young pen; W. A. Campbell, Syracuse, N. Y., 5 ckl.; Dorman & Anderson, Bridgeport, Conn., 1-2-3-4-5 pl.; Fay J. Dougherty, Syracuse, N. Y., 3 old pen.

Not much in cocks. First and 2d cockerels well finished and nice striping. No class for Dark Brown females, with the Light females proving attractive. Some big, well bred pullets under the ribbons. Not the interest in Browns here that one sees at some other shows. Ohio State Fair had 150 Browns this year.

R. C. Brown Leghorn—E. B. Cole, New Hartford, Conn., 1-2-5 cock, 4-5 hen, 4 ckl., 3-4 pl., 3-4 young pen; F. B. Lampman & Son, Freeville, N. Y., 3-4 cock, 3 hen, 1-2 ckl., 5 pl., 1 old pen, 2 young pen; D. C. Lake, Oneonta, N. Y., 1-2 hen, 3-5 ckl., 1-2

EGG RECORDS FROM 180 TO 265

Here are the birds that are making money for their owners NOW. These are the kind you should have the coming winter, and this is the month you should buy, before prices advance.

SUNNYSIDE PULLETS

"Hoganized"—Trapnested—Pedigreed

Order now from any of the following varieties: White and Buff Leghorns, R. I. Reds, Barred White Rocks, White Wyandottes.

12 Weeks Old		5 Months Old	
180-200 egg bred	\$1.75	180-200 egg bred	\$2.50
210-248 egg bred	2.00	210-248 egg bred	2.75
240-256 egg bred	2.25	240-256 egg bred	3.25

Hens of same record, \$2.25, \$2.75, \$3.25. Cocks, \$5.00, \$10.00, \$15.00.

SUNNYSIDE POULTRY FARM, R. C. Blodgett, Prop. Box 1002, BRISTOL, VT.

Funk's International Strain

Line bred heavy egg record

S. C. White Leghorns WON

in heavy laying classes Illinois State Fair, August, 1921:

1st, 2nd, 3rd, 4th, 5th cockerels. 1st, 2nd, 3rd, 4th, 5th hen.
1st, 2nd, 3rd, 4th, 5th pullet. 1st, 2nd, 3rd pen.

A complete cleanup of all prizes means that my Leghorns must have the proper physical characteristics required for high egg type birds. Grade A cockerels \$7.00 each. Grade B cockerels \$5.00 each and Grade C cockerels at \$4.00 each. Buy these cockerels now—they are selling fast.

Yearling hens that have been used as breeders in my own flocks this season at only \$3.50 each. Discount on lots of 50 and 100 birds. Let me mate you up a pen of my flock right now for your next season's breeding by sending you these fine, strong yearling hens mated to these vigorous, early hatched International strain cockerels. The matings will give you consistent and profitable egg production all winter.

Satisfaction guaranteed or birds may be returned at my expense.

Funk Egg Farm, Lyle W. Funk, Sole Owner, Box 38, Bloomington, Ill.

MAHOOD'S S.C.R.I. REDS

THEY POINT THE WAY

Is your heart's desire

A Red to win?

A Red to lay?

Or a Red your neighbors will envy? Mahood has them all, and can give you just what you want at a reasonable price. Send for Mahood's fall sales list. It will give you more information about Mahood's Reds and their unparalleled record for nine years at Chicago Coliseum, the world's greatest Red show. Eggs from fall matings at half price at \$10, \$7.50 and \$5 for 15.

Webster Groves, Mo.

Homestead Silver Campines

The vigorous strain—dominate in the world of Campines. The wonderful BELGIAN fowl—noted for their heavy egg production—"THE EVERYDAY LAYER" unequalled as BROILERS. These birds are not alone FAMOUS for their UTILITY, but are BEAUTIFUL and MOST interesting. Some wonderful breeding stock for sale directly after the breeding season closes but now is the time to book your order that you may not be disappointed.

Eggs Half Price Balance of Season.

HOMESTEAD CAMPINE FARM,

Box A,

WAYLAND, MASS.

BIG SCHOOL EXPANDS

American Poultry School Opens Eastern
Office in Charge of Prof. Harry R. Lewis

Kansas City, Mo.—Poultry raisers and all those interested in Poultry Culture will be glad to know that the country's greatest Poultry School has brought its services closer to Eastern and Southern sections of the United States. The Directors of the American Poultry School, of which T. E. Quisenberry is Dean, have announced the opening of an Eastern office at Davisville, Rhode Island, with Professor Harry R. Lewis in charge.

Professor Harry R. Lewis, Well Known Poultry Expert, now in Charge of Eastern Office of the American Poultry School.

Professor Lewis, who was formerly with the New Jersey Experiment Station, has been elected a Vice-President of the American Poultry School and has placed his own poultry farm at the disposal of the School for Demonstration purposes in testing out new ideas and formulas for the benefit of the students. Many readers will remember Professor Lewis as an author of books, bulletins and magazine articles along poultry lines. He has also exhibited White Leghorns

and Barred Plymouth Rocks at various shows, winning honors with his birds and birds of his breeding exhibited by others.

The American Poultry School has thousands of students located throughout the Eastern and Southern States who will now have Professor Lewis' help in solving their poultry problems. His long experience and expert knowledge, coupled with his ability to impart his knowledge to others, should prove of invaluable assistance to students of the American Poultry School. Professor Lewis will devote his entire time to private poultry work and in promoting the interests of the students in his territory.

The development and growth of the American Poultry School has been quite remarkable. From a small institution a few years ago, it has expanded year by year until now the rolls show a total of more than 35,000 men and women graduates or present students located in every state in the Union and nineteen foreign lands. The opening of the Eastern Office is, therefore, a natural development in the expansion of this institution. The simplified course of instruction offered by the American Poultry School is given by correspondence, under the direction of Prof. T. E. Quisenberry, assisted by a staff of practical poultrymen, who are well known to readers of poultry publications.

Eight Hundred April Pullets at the Harry R. Lewis Farm.

A new book, "Dollars and Sense in the Poultry Business," which outlines hundreds of poultry secrets developed and applied by Professor Quisenberry, will be sent to any readers of this publication who are anxious to enjoy better success with poultry and bigger profits. In writing for this free book, address The American Poultry School, Dept. 4206, Kansas City, Mo.—Advertisement.

pl.; Ralph N. King, Orrville, Ohio, 1 young pen.

First hen, big; well stippled. First pullet a star in type, head, stippling and neck striping.

S. C. Buff Leghorn—Geo. W. Rex, State-dale, Pa., 2 cock, 2 ckl.; Monmouth Poultry Farm, Freneau, N. J., 1-3 cock, 1 hen, 1-5 ckl., 1-2-3-4 pl., 1 old pen, 1 young pen; Frank Broughton, Syracuse, N. Y., 4 cock, 4 ckl.; Wm. E. Crevoiserat, Freeport, N. Y., 5 cock, 3-4 hen, 2 old pen; E. W. Terwilliger, Utica, N. Y., 5 hen, 5 old pen, 5 young pen; John G. Linville, 2 hen; A. W. Dakin, Syracuse, N. Y., 3 ckl., 3 young pen; Geo. G. Cable, Toledo, Ohio, 5 pl.; L. E. Merihew, Marathon, N. Y., 3 old pen, 2 young pen; Donald T. Baker, Syracuse, N. Y., 4 old pen; J. E. Kaiser, Verona Sta., N. Y., 4 young pen.

Lemon or uneven colored males had no chance against the 1st cock; a fine sheet of color, with as clear a tail as grows; good type and condition. Second cock, smaller. If anybody has a better shaped and colored hen than the 1st, he should let folks see her; and this is no pullet; fails in bleached shanks. First cockerel combined good head, style, body and station, with soft, even, golden color, and finish of plumage. Second, a close runner-up. Third, a shade hot on wing bows and over back.

First pullet had the type of a fast White Leghorn; size without coarseness; one soft, perfectly beautiful sheet of color from top of head to tip of tail. Second has a little lacing. Third not quite the spread of tail. Fourth, another good one. Fifth in same class; station and balance equal to first but a little younger and shy in breast. Such pullets are dreams come true.

R. C. Buff Leghorn—E. W. Terwilliger, 1 cock, 1 hen, 1 ckl., 2 pl., 1 old pen; Louis H. Perry, Clay, N. Y., 2 ckl., 1 pl., 1 young pen.

S. C. Black Leghorn—Harvey A. Drew, Glenwood, N. J., 2 cock; Clarence M. Davidson, Hempstead, N. Y., 1 cock, 1 hen, 2-5 ckl., 4 pl., 1 young pen; Adam E. Patterson, Jr., Stewartstown, Pa., 3 cock, 5 hen; Wright Scidmore, Balston Spa, N. Y., 4 cock, 3-4 hen, 1 old pen; John G. Linville, 5 cock, Mrs. C. Giegel, Secaucus, N. J., 2 hen, 2 old pen, 5 young pen; Tip-Top Farms, Butler, Pa., 3 ckl., 3 pl., 4 young pen; Wm. R. Mollineaux, Hempstead, N. Y., 1-4 ckl., 1-2 pl., 2 young pen; Alonzo T. Losea, Hempstead, N. Y., 5 pl., 3 young pen; W. A. Shafer, Oneonta, N. Y., 3 old pen.

One of the strongest classes ever cooped. Pure yellow shanks predominate. If other Leghorn men are not watchful, Blacks will soon have the best shanks. Splendid Leghorn type is found in the class; good heads, station, backs and tails, and a beautiful sheen of color.

R. C. Black Leghorn—Wright Scidmore, 1 cock, 1-2 hen, 1-2 ckl., 1 pl., 1 old pen, 1 young pen.

Silver Leghorn—Dr. F. O. Dudgeon, Cleveland, Ohio, 2 cock, 2-4 hen, 1 ckl., 3 pl., 1 old pen, 1 young pen; B. F. Ferguson, Dryden, N. Y., 1 cock, 3 hen, 3-4 ckl., 1-5 pl., 2-3 young pen; Adam E. Patterson, Jr., Stewartstown, Pa., 1 hen, 2 ckl., 2-4 pl.

Silver Duckwing Leghorns are looking up. No breeder has devised a more beautiful color than is carried by these steel gray pullets with their robin red breasts. Quality at Syracuse is plain evidence that variety is in intelligent hands.

S. C. Black Minorca—F. E. Paige, Medina, N. Y., 2 cock, 1 hen, 3 ckl., 3 pl., 2 old pen; Wm. C. Clare, Oswego, N. Y., 3 cock; Onondaga Minorca Yards, Syracuse, N. Y., 1-4 cock, 4-5 hen, 5 ckl., 1-2 pl., 1 old pen, 2 young pen; Geo. C. Hicks, Marcellus, N. Y., 5 cock, 3 hen, 2 ckl., 4 pl., 3-4 old pen; T. J. Ager, Munsville, N. Y., 2 hen, 5 old pen, 1 young pen; Sickler P. Weed, Ballston Spa, N. Y., 4 ckl., 3 young pen; R. E. Arbuckle and Diddlein, Brownsburg, Ind., 1 ckl.; Albert Hutson, Oneonta, N. Y., 5 pl.

Drevenstedt had his work cut out for him in judging Minorcas. If anyone wants to see a Giant in the class aves the 1st Black cock will measure up to his expectations of bone and substance of body. Small hens had no show against the big, black matrons. We have seen better boned cockerels at Syracuse than 1st and 2d, but not better finish of plumage including tail. First pullet ready; 2d, still undeveloped in comb, with reach and length of body, tail carriage and head that quality necessitates.

R. C. Black Minorca—John G. Linville, Urbana, Ohio, 1 cock.

S. C. White Minorca—Mrs. J. G. Osborne, Fabius, N. Y., 3 cock; Mary Meiselbach, Melrose Park, Ill., 1 cock, 1 hen, 4 old pen; F. E. Derrick, Bath, N. Y., 2-4-5 cock, 5 hen, 1-5 ckl., 3-4 pl., 1-2 old pen, 2-4 young pen; Hamilton Egg Farm, Rochelle Park, N.

SMOKE-EM

CANNED SMOKE

REG. U.S. PAT. OFF.

THE GUARANTEE ROUP CURE was discovered on our breeding estate, where we breed registered Holstein Cattle, Spahr's Giant Epochal Berkshire Hogs, and our world's famous NONESUCH, Ferris White 300-egg strain leghorns. After losing several thousand dollars' worth of our valuable birds, we were determined to discover a cure for Roup, Colds, Canker, Diphtheria, Chicken-Pox, etc. After discovering and using "SMOKE EM," (canned smoke) we have not lost a bird. WE POSITELY GUARANTEE "SMOKE EM," (canned smoke) to effect a complete cure or every cent of your money back. Read what Mr. Jos. W. Smith of Burbank, Calif., says: "I have tried 'SMOKE EM,' (canned smoke) and I know it does the work." Mr. Chas. Brantner, Polo, Ill., R. No. 7, writes: "'SMOKE EM' surely is the best thing we have ever tried for Roup, Colds, Canker, etc. It is an absolute cure." Ex-Judge A. W. Eckert, of Woodboro, Md., says: "I have used 'SMOKE EM,' GUARANTEE ROUP CURE, and find it a very excellent remedy for Roup. I used several remedies but 'SMOKE EM' was the only one that produced an absolute cure." Thousands of unsolicited testimonials on file at our office.

ALFRED F. GRAHAM

CAMERON, N. C.

J., 2-3-4 hen, 1-2 pl., 3 old pen, 1 young pen; H. B. Shapley, Earlville, N. Y., 4 ckl.; Jos. F. Reichert, St. Cloud, Minn., 2 ckl., 3 young pen; F. E. Paige, 3 ckl., 5 pl.

First, 2d and 3d White Minorca cocks were big ones and white, but in hard feather. First, 2d and 3d hens were big in bone and rangy in body as one expects to see in the average Black class. We doubt if a bigger and better shaped hen than 3d has ever been shown; she won shape special. Slipped wings on 1st cockerel. First pullet, good length and typical; a better one is a rare avis. Second pullet close runner-up.

R. C. White Minorca—Mrs. J. G. Osborne, 3 cock, 2 hen, 1-3 ckl., 1-4 pl., 1 old pen, 1 young; Willard W. Teetz, Gloversville, N. Y., 1-2 cock, 1 hen, 2 pl.; L. L. Reed, Marathon, N. Y., 2 ckl., 3-5 pl.

Buff Minorca—Albert F. Loth, Buffalo, N. Y., 2-5 cock, 1-2 hen, 2-3 ckl., 3-4 pl., 2 young pen; Lyle M. Gifford, Oneonta, N. Y., 3 cock; Chas. I. Smith, Eaton, N. Y., 1 cock, 3 hen, 4 ckl., 1 young pen; Sunnyside Farm, 4 cock, 4 hen; Geo. A. Montgomery, 2 pl., 3 young pen; R. E. Arbuckle and Diddlein, 1 pl.

The best showing of Buff Minorcas that we have seen in the east. First pullet as big as a Black and level in golden color; some black ticking in tail.

W. F. Black Spanish—Sunnyside Farm, Syracuse, N. Y., 1 cock, 1 hen.

Blue Andalusian—E. D. Bird, Greenwich, Conn., 2 cock, 1-2-3 ckl., 2-3 pl., 1 young pen; Walter C. Dobe, Buffalo, N. Y., 1-3-4 cock, 2-3-4 hen, 5 ckl., 4-5 pl., 1 old pen, 2 young pen; Trout Poultry Yards, Fostoria, Ohio, 1-5 hen, 4 ckl., 1 pl.; W. A. Shafer, Oneonta, N. Y., 2 old pen, 3 young pen.

Good quality in 1st cock. Second fails to 3d in size. Third grand old bird; big; good type; still valuable breeder, but appears little off for showing. First hen at her best; just far enough through molt to have a concentrated feather that shows intensity of color and lacing. First and 2d cockerels, good development, heads and type. First has best blue ground in breast. First pullet heavily laced and smudgy on back and breast. We look for better quality in pullets at later shows.

S. C. Mottled Ancona—Wilbur Rayburn, Brockport, N. Y., 2 cock, 3 hen, 4-5 ckl., 2-4 pl., 3 old pen, 1-4 young pen; Alfio S. Troja, Utica, N. Y., 4 cock; Geo. N. Barstow, Oneonta, N. Y., 1-5 cock, 5 hen; F. J. Wemett, Livonia, N. Y., 3 cock; Pamsee Egg Farm, Library, Pa., 2 hen, 5 pl., 3 young pen; John Blatt, Jr., Utica, N. Y., 4 hen; C. R. Kolbe, Eastwood, N. Y., 3 ckl., 5 young pen; G. & W. Ratz, Tavistock, Ont., Can., 1-2 ckl., 1-3 pl.; F. J. Dougherty, Syracuse, N. Y., 1 old pen; E. K. North, Syracuse, N. Y., 2 old pen.

Cock class not as strong as sometimes seen here. First cockerel, wonder; a white tick no larger than pin head at end of nearly every hackle feather; snowflake tips of white on back and saddle; nice tipping over wings, breast and underbody; excellent head. With all this tipping, not a weak colored bird; only one wing fluff being gray. First hen, 1st, 2nd, and 3d pullet, black, with tips on nearly every feather; not a big white splash, but neat mottling. A female with one tip in five cannot win here. Breeders also getting splendid shape and style in their females.

R. C. Mottled Anconas—Leo M. French, Framingham, Mass., 1-2-3 cock, 3-5 hen, 2-5 ckl., 3-4 pl., 1 young pen; Mrs. R. F. Payne, Utica, N. Y., 4 cock; Maurice C. Peters, North Bennington, Vt., 5 cock, 4 hen, 2 young pen; Geo. N. Barstow, 1-2 hen; Wilbur Rayburn, 4 ckl., 1 pl.; G. & W. Ratz, 1-3 ckl., 2 pl.; Chas. D. Chapman, Hoosick Falls, N. Y., 5 pl.; F. J. Dougherty, 1 old pen.

White Dorking—Chas. H. Yaple, 1-2 cock, 1-2 hen, 1-2 ckl., 1-2 pl.; Sunnyside Farm, 1 old pen. The best W. Dorkings seen in many a day.

Silver Grey Dorking—Chas. H. Yaple, 1-3-4 cock, 1-4-5 hen, 1-3-4-5 ckl., 1-2-4 pl.; Sunnyside Farm, 1 old pen, 1 young pen; Watson Westfall, Sayre, Pa., 2-5 cock, 2-3 hen, 2 ckl., 3-5 pl. Splendid quality all through S. Grays.

Colored Dorking—Chas. H. Yaple, 1-2 cock, 1-2 hen, 1 ckl., 1 pl.; Sunnyside Farm, 1 old pen. A few, grand big Dark Dorkings.

Red Caps—J. E. Kaiser, Verona Station, N. Y., 1 ckl., 2 pl., 1 young pen.

S. C. Buff Orpington—Mayslake Farms, Hinsdale, Ill., 1-2 cock, 2-4 hen, 2-4 ckl., 1-2 pl., 1 old pen, 1 young pen; Owen Farms, Vineyard Haven, Mass., 4 cock, 3 hen, 1-3 ckl., 3 pl., 2 old pen, 2-3 young pen; Egg-a-Day Farm, Meriden, Conn., 3-5 cock, 1 hen, 4 pl., 4 young pen; Kingman Farm, Randolph, Mass., 5 hen, 4 old pen, 5 young pen; Geo. E. Besson, Mansfield, Mass., 5 ckl., 5 pl.; S. C. Crandall, Utica, N. Y., 3 old pen.

A great collection of cocks. First, a big

Grand, good show birds with breeding back of them not exceeded in the whole world. Single birds. Expert mated pens or a whole string for your show. Best of conditioning. Moderate prices. Thirty years a breeder and judge.

F. H. DAVEY Box 40 GREYSTONE, YONKERS, N. Y.

GUARANTEE DOUBLE HEALTH AND EGG PRODUCER was discovered on one of the largest breeding estates in the world. Is fed regularly to our world's famous NONESUCH FERRIS WHITE 300-egg strain Leghorns. 750 layers fed GUARANTEE DOUBLE HEALTH AND EGG PRODUCER averaged 215 eggs per hen last year. This was accomplished by feeding thoroughbred stock GUARANTEE DOUBLE HEALTH AND EGG PRODUCER, regularly. Hens must be kept in the best of health to be profitable layers. Sick hens WILL NOT LAY. During fall and winter the weather is changeable and chickens are subject to colds which bring on the deadly roup. First symptom being poor appetite and the hens refusing to lay. KEEP YOUR CHICKENS IN PERFECT HEALTH, by feeding a teaspoonful to fifty hens of GUARANTEE DOUBLE HEALTH AND EGG PRODUCER, which is an honest medicine without a filler. Must double your egg production or your money back. Send us \$1.50 for two regular \$1.50 cans. \$3.00 value for \$1.50. Special introductory offer made for a limited time only.

DR. B. H. MANSEL

Box 202

QUAKERTOWN, PA.

yearling, with breadth, depth and a strong head. Second was 1st at last Chicago Coliseum, a very massive bird. Third, another grand big one. Fourth, correct body conformation, practically smooth in top and breast color. First hen, superior type. Second, excels in size; level, soft color. Third, a well built, very smooth colored hen; shy of plumage on abdomen. First cockerel, a beautiful buff. Third of same color and even better finish but sets quite low on hocks. Second and 4th, big, massive, well grown fellows; broad in shoulders and back, with splendid depth and tail coverts as numerous as a Black. First and 2d pullets, a magnificent pair with true Orpington type, including breasts down where they belong; soft, golden color, one shade all over. Third pullet fails in lobe. Fourth, a hotter color.

Black Orpingtons — Awards not marked. Exhibitors were Mrs. R. F. Payne, William J. Georgius, G. F. Allen & Son.

Some good quality in Blacks, particularly 1st cockerel. First pullet would improve the remaining stock of Black Cochins; and yet hats off to the man who can produce such size and wealth of feather. It doesn't come in a runt.

S. C. White Orpington — Elmer R. Oettinger, Wilson, N. C., 4 cock, 4 ckl, 2 pl.; Crescent Farm, Evansville, N. Y., 3 cock, 1 hen, 4 pl., 5 young pen; Harry Paxton, Gloversville, N. Y., 5 cock, 5 ckl, 2 old pen, 3 young pen; J. S. Greenshields, Toronto, Ont., Can., 1-2 cock, 2-3-4-5 hen, 1-2-3 ckl, 1 old pen, 1-2 young pen; Glenwood Poultry Farm, Syracuse, N. Y., 1-3 pl.; G. F. Allen & Son, Norwalk, Conn., 5 pl. 4 young pen.

A strong class of Whites. First cock, an outstanding winner in shape and condition. First hen a clean, smooth, fresh looking hen. Second, a great Orpington, with proportion and quality. First cockerel, younger than 2d and 3d, which are great big ones, and better than usual; but 1st is going to make a masterpiece; wonderful front, back and general set-up. It will be no amateur's job to trot out one to beat him. In pullets, quality and growth were conspicuous, the 1st having a slight edge on the others; such fronts and proportions do not come by chance; they show breeding and thoughtful care.

R. C. White Orpington — Glenwood Poultry Farm, 1-2 cock, 1-2 hen, 1-2 ckl, 1-2 pl, 1-2 old pen, 1 young pen.

Dark Cornish — Fred H. Bohrer, Utica, N. Y., 1-4-5 cock, 2-4-5 hen; Ernest B. Stanley, North Bennington, Vt., 2-3 cock, 1-3 hen, 1 ckl., 1 pl., 1 old pen, 1 young pen; Dr. Howard H. Reid, Barre, Vt., 2 ckl., 2 pl.

The time is here when one must become accustomed to quality in the bulldogs. Class not as large this year, and 1st Dark cockerel young; but several pleasing birds appear in all three varieties of Cornish.

White Cornish — A. A. Mosher, Clinton, N. Y., 1 cock, 1-2-3 hen, 4 ckl, 1 pl., 1 old pen, 1 young pen; D. A. Mosher, Clinton, N. Y., 5 hen; John G. Linville, 4 hen, 3 ckl, 3 pl.; C. W. B. Korb, Roanoke, Va., 1-2 ckl., 2-4 pl.

White Laced Red Cornish — Dr. Howard H. Reid, 2 cock; Mrs. Ernest B. Stanley, 1 cock, 1 hen, 1-2 ckl., 1-2 pl., 1 young pen; Sunnyside Farm, 3 cock, 2 hen.

Red Sussex — Sunnyside Farm, 1 cock, 1 hen.

Speckled Sussex — T. Cadwallader, Doylestown, Pa., 5 cock, 5 hen, 3-5 pl., 2 young pen; A. B. Schilling, Rochester, N. Y., 1-2 cock, 1-2 hen, 1-2 ckl., 1-2 pl., 1 old pen, 1 young pen; Chantecleer Poultry Plant, Ulster, Pa., 4 cock; J. L. Thomas, Binghamton, N. Y., 3 cock; J. De Ver Rogers & Son, Oxford, N. Y., 3-4 hen, 4 pl.

The females are the attractive sex in Speckled Sussex, with such pullets as the 1st showing to what perfection a breeder's work may attain; rich red ground color throughout, each feather marked with a narrow black bar and tipped with a small, neat white spangle. First and 2nd hens of the same quality, and show wonderful clean ground color now possible in the best hens. Breasts on males show an elegant division of the tricolors and indicate breeding value as getters of fine pullets.

Silver Spangled Hamburg — Arch L. Mayo, Pittston, Pa., 3-4 cock, 3 ckl., 3 pl., 2 young pen; Elmer E. Wert, Gloversville, N. Y., 1 cock, 2-3 hen, 1 old pen; J. H. Williams, Antwerp, N. Y., 2 cock, 4-5 hen, 2-4 ckl., 1-2 pl., 2-3 old pen, 1-3 young pen; Sunnyside Farm, 5 cock; Mrs. J. C. Vanderloef, 1 hen, 5 ckl., 4 pl.; H. T. Vierow, Rome, N. Y., 1 ckl., 5 pl.; Geo. Van Der Veer, Amsterdam, N. Y., 4 young pen. Good quality and keen competition throughout.

Golden Spangled Hamburg — James Martin, Maywood, Ill., 2 cock, 1-2 hen, 3 ckl., 1-2 pl., 1 young pen; Sunnyside Farm, Sta. A, Syracuse, N. Y., 1 cock, 4 hen; Daniel C. Bristol, Bainbridge, N. Y., 3 hen, 1-2 ckl.

Wipe Out Every Rat and Mouse

Don't be satisfied with trapping or poisoning just a few. Exterminate the whole bunch—old, young, big and little. A single pair left, in a short time, will produce enough to overrun the place. That's why we say **KILL THEM ALL.**

Rats do millions of dollars' damage each year. They kill chickens, destroy grain, damage buildings and property. They are filthy, dangerous, destructive, disease carriers. Wipe them out—not just one or two at a time—but the entire colony.

EASY TO GET EVERY ONE

A new scientific discovery, called Imperial Virus, now enables you to rid your place of every rat, mouse and gopher easily, quickly, entirely, without trouble, muss or danger. It is absolutely guaranteed to clean out every one of them.

NOT A POISON

Imperial Virus is absolutely harmless to humans, domestic animals, poultry, etc., but is sure death to rodents, and rodents only. Fed to them on bread, grain, etc., it gives them a fatal disease, which they give to others and are all wiped out. Best of all, they die outside, hunting water and air.

You can spread this Virus in your chicken house, around gopher mounds, anywhere, knowing it cannot possibly harm any fowl, dog, cat or other domestic animal.

GET YOURS FREE

The manufacturers of this amazing Virus are anxious to get immediate distribution everywhere and make this big offer. (Act now or clip this offer for future reference, as it may not appear again.) Send \$1.00 (bill, money order, check, etc.) to the Imperial Laboratories, Room 130, 2110 Grand Ave., Kansas City, Mo., and you will receive two regular full sized (double strength) \$1.00 packages, postpaid. Use one bottle to rid your own place of these pests. When you see how easy it is, tell a neighbor about it and sell him the extra package, making your own cost you nothing. You will be told also how you can make money by telling your friends about it. You need send no money. If you prefer, simply pay the postman \$1.00 and postage when you get the two packages. If you are not satisfied after thirty days your money will be refunded.

Silver Penciled Hamburg—Sunnyside Farm, 1 cock, 1 hen, 1 ckl., 1 pl.

Golden Penciled Hamburg — Sunnyside Farm, 1 cock, 1-2 hen.

White Hamburg—Daniel C. Bristol, 1 cock; Sunnyside Farm, 2 cock, 1 hen.

Black Hamburg—John C. Linville, 1 cock, 2 hen; Sunnyside Farm, 2 cock, 2 ckl., 1 old pen; Daniel C. Bristol, 3 hen; Geo. A. Montgomery, 1 hen, 1 ckl.

W. C. Black Polish—Will J. Kelly, Cambridge Springs, Pa., 1 cock, 1-2 hen, 1-2 ckl., 1-2 pl., 1 old pen, 1 young pen; John G. Linville, 3 cock, 3 hen, 3 ckl., 4 pl.; Sunnyside Farm, 2 cock, 4 hen, 2 old pen; H. F. Vierow, Rome, N. Y., 4 ckl., 3 pl. First hen top of class; great crest and good body.

Bearded Golden Polish—John C. Linville, 2 cock; Sunnyside Farm, 1 cock, 1 hen, 1 ckl., 1 pl., 1 old pen.

Non-Bearded Silver Polish—Walworth Polish Yards, Ogdensburg, N. Y., 1 cock, 1-3 hen, 1 ckl., 1-2 pl., 1 old pen; Sunnyside Farm, 2 cock, 2 hen.

Buff Laced Polish—Sunnyside Farm, 1 cock, 1 hen, 1 ckl.

Mottled Houdans—W. E. Bast, Philipsburg, N. J., 1-2 cock, 1-3 hen, 1-2 ckl., 1-2 pl., 1 old pen, 1 young pen; J. C. Michaud, Fulton, N. Y., 2 hen; John G. Linville, 3 ckl., 3 pl.; Sunnyside Farm, 2 old pen. First hen a fine Houdan; big; good head and body. First pullet, same quality.

White Houdan—Sunnyside Farm, 1 hen, 2 ckl., 2 pl., 1 old pen; John G. Linville, 1 ckl., 1 pl.

Creve Coeur—John F. Bird & Son, 1 hen, 1 ckl., 1 pl.; Sunnyside Farm, 2 hen.

La Fleche—Henry D. Barto, Pompey, N. Y., 1-2 ckl., 1-2 pl.

White Faverolle—Sunnyside Farm, 1 cock, 1-2 hen.

Salmon Faverolle—H. Hidley, West Sand Lake, N. Y., 1 pl.

Silver Campine—Maple Lawn Farms, Cortland, N. Y., 1-2-3 cock, 1-2-3 hen, 1-2 ckl., 1-2-3 pl., 1 old pen; Sunnyside Farm, 4 cock, 5 ckl., 2 young pen; John F. Dix, Jamesville, N. Y., 4-5 hen, 3-4 ckl., 4-5 pl., 2 old pen, 1 young pen.

Cockerels show good breeding, but need a little more age. First and 2d pullets nice type and barrine. Homestead Campine Farms not showing this year except at Madison Square Garden, leaving Syracuse and Boston open. Mr. Phipps was undecided whether to offer cash specials to bring out heavier entries of Silver Campines, or to leave the field more open to other breeders. He finally decided that the opportunity for other breeders to show and win would be the biggest encouragement and stimulate greater interest in this beautiful and deserving variety.

Golden Campine—Geo. B. Lawrence, Poughkeepsie, N. Y., 1 cock, 1 hen, 2 ckl., 2 pl.; Sunnyside Farm, 2 cock; Henry Baumann, Valley Stream, N. Y., 1 ckl., 1 pl.

Jersey Giant—F. E. Paige, Ogdensburg, N. Y., 2 cock, 1 hen, 3 ckl., 4 pl.; Wilburtha Poultry Farm, Trenton Jct., N. J., 1-3 cock, 2 hen, 1-2 ckl., 1-2 pl.; H. W. Schriver, Groton, Conn., 4 ckl., 3 pl.

Some splendid bodied birds here. There is a great deal of interest in the variety. It is something of a common farm fowl in parts of New Jersey, like the R. I. Red is in Rhode Island. The birds are strong, stocky, rugged stock.

Buttercup—Mrs. Hattie D. Reed, Marcelus, N. Y., 3 cock, 2 hen, 2 ckl., 3 pl., 1 old pen, 2 young pen; Chas. J. Lieber, Homer, N. Y., 5 cock, 4 hen, 1-5 ckl., 2-4 pl., 1 young pen; Dr. Rufus J. Howe, Worcester, Mass., 2 cock, 1 hen, 3 ckl., 1 pl.; J. L. Thomas, Binghamton, N. Y., 1-4 cock, 5 hen, 2 old pen; Paul Abbott, 3 hen, 4 ckl., 5 pl.

First cockerel good. Cockerels show greater uniformity of carriage and color. Hens weak. First pullet, very nicely marked.

Lakenvelder—Walter S. Hastings, Jefferson, Mass., 1-2 cock, 1-2 hen, 1-2 ckl., 1-2 pl.; Sunnyside Farm, 1 old pen.

Sultan—Sunnyside Farm, 1 cock, 1 hen.

Silkie—Sunny Shore Poultry Yard, Warrensburg, N. Y., 1 cock, 4 hen, 1 ckl., 2 pl., 1 old pen, 1 young pen; Joe Needle, Ogdensburg, N. Y., 2 cock, 1 hen; John T. Bird & Son, 4-5 cock, 2 hen, 3 ckl., 5 pl., 2 old pen; John G. Linville, 3 cock, 5 hen, 4 ckl., 1 pl.; Emmons Raymond, Hingham, Mass., 3 hen, 2 ckl., 3-4 pl., 2 young pen.

Another strong class of Silkies.

Black Sumatra—John Shuert, Syracuse, N. Y., 5 cock, 3 hen; W. A. Shafer, Oneonta, N. Y., 2 cock, 5 hen, 2 ckl., 2 pl., 1 old pen, 1 young pen; Geo. A. Montgomery, Cambridge, N. Y., 1 cock, 2 hen; John G. Linville, 3 cock, 1 hen, 1 ckl., 1 pl.; Sunnyside Farm, 4 cock, 4 hen.

In Oriental Games, Sumatras now appear to lead. Great sheen of color and furnish of feather possible in this variety. The birds have a very plump breast and are reasonably good layers. The variety should attract new friends.

The 200-Egg Exhibition Strain

Champions Chicago, Milwaukee, Minnesota State Fair; Illinois State Fair; Wis. State Fair, etc.

At the recent Wisconsin State Fair, Aug. 29 to Sept. 3, 1921, 1-2-3-4-5 Hen, 1-3-4 Cock, 1-2 Old Pen, on an entry of Old Stock only, my early youngsters won for my customers throughout the States. I make no reservations. My birds are for sale, from the \$3.00 Utility Bird to the Best Show Bird, ready to go and make sweeping victories, such as they have been making for me and my customers.

Can furnish Show Birds for any show, have thousands to select from.

500 yearling exhibition bred-to-lay Hens, ready to start you on the road to success, the kind that have the 200 egg record habit.

Your Money Back

WE GUARANTEE that, if you will divide an orchard, your worst or best, in two parts equal in general condition, and for three years spray one part with Scalecide according to our directions and the other part with lime-sulfur, giving the same summer treatment to both parts, the part sprayed with Scalecide will be better than the part sprayed with lime-sulfur—in the judgment of three disinterested fruit growers—or we will refund the money you have paid for the Scalecide.

Scalecide controls scale, fire blight canker, pear psylla and aphids—and it does more; it has an invigorating effect upon trees and foliage, insuring plumper fruit spurs and a better chance for fruit the following year. Write today for information and price. Address Dept. 21.

On Standard Revisions.

By Theo. Hewes.

The more we hear of the Seattle meeting the less we seem to know. From the most reliable information obtainable it seems that that part of the Revision Committee's report suggesting that the text of the Standard be prepared prior to the annual meeting in 1922, and submitted to that meeting for approval or correction carried. It seems that the stenographic report of the Seattle convention was so badly muddled up that there will be no official proceedings printed, and about all we can depend upon is the secretary's report, which, up to the present time, has not been printed. It would seem to me that now is the time for the fanciers and breeders of Standardbred poultry to get together, both as specialty clubs and as individual breeders, and offer such suggestions for changes as will make the Standard of 1923 complete.

I know that the present Standard on a number of the important breeds, require no changes, unless it be a better general description of the breed, and it is quite likely that the club Standard as submitted will be adopted in toto or nearly so.

With the addition of Mr. Schwab, who is taking the place of Mrs. Campbell on the Revision Board, the eastern breeders have someone to refer to and someone who they will always find ready and willing to help, but it is well to understand that all suggestions for changes must be in writing and submitted to the chairman of the revision committee, E. C. Branch, Lees Summit, Mo. As I understand from Mr. Rigg, the revision committee will meet in Indianapolis about May 1. The committee's report as adopted at Kansas City calls for the revision committee to remain in session until their entire work is completed, so every member of this revision board should understand this in advance, and be prepared to stay in Indianapolis any reasonable length of time so that nothing will interfere with this important work.

Any breeder who can do so is invited to attend the revision committee meeting at Indianapolis. The press will fully advise as to when and where this committee will meet. I know that I voice the sentiment of the majority of members of the revision com-

mittee when I say that you are not only welcome, but you are wanted at that time to help us make a Standard that will be satisfactory to all fair-minded breeders. It is well to remember that in preparing a Standard to run for a period of eight years, that we should set our stakes well ahead so that the breeders will not surpass us with living specimens before the expiration of the eight-year period.

Up to the present time there has been no expense incurred by the revision committee, but at the Seattle meeting a small sum of money was set aside for the use of the chairman to take care of stenographic work and postage.

The constitution of the American Poultry Association gives the executive committee the right to select the place of the annual meeting, but I question if they have not exceeded their authority by voting the next meeting to Knoxville without first securing bids from prospective cities; and I hope that the meeting of the revision committee may bring together hundreds of fanciers who will in the right way help the revision board in the preparation of the text of a new Standard, so feel free to attend our meeting in Indianapolis, for I know that many of you want to be heard, and have a right to be heard, but will be unable to make the long trip to Knoxville.

Starting With Poultry.

The late article upon starting in the poultry business, appearing in this journal, will disappoint many readers who have not the thousands of ready cash necessary to start in that way, yet who feel that the poultry business should offer to the man with small means a chance to start and build up.

No criticism can be offered of the article, but maybe a few words of helpful advice can be added for this greater class of our people who live nearer from hand to mouth and who must get started some other way, if started at all.

The profit one may count he has made from a back-yard flock is usually estimated without figuring the cost of all the feed, for such a flock receives much from the back door. We have seen from the article mentioned that it costs money to erect buildings,

provide runs and shelter, buy land, pay rent, supply feed, etc.

Instead of starting off at a bound I suggest the surest way to build up a poultry business, upon which one could lean entirely in a few years would be to continue to follow the trade or occupation, labor or work, already engaged in and continue to have that income upon which to rely.

Build another coop; make another run on your back lot. A coop 6 ft. wide by 12 ft. long will comfortably house 25 laying hens, winter and summer, day and night, no yarding whatever, if it is built right, kept clean and supplied with litter. They can be built within ten feet of each other, so the sun can shine over the one and into the floor of the other. You could keep a thousand hens on one city lot, 50 feet wide by 150 feet deep, and have little runs at the front or back of each coop, between the two.

You can raise, beginning with baby chicks, enough pullets in one such coop, to give you your colony of twenty-five hens left after selling off the cockerels, and, if you feed properly, and keep the house clean and supplied with litter, they will be just as bouncing, thrifty as if given 1,000 acres of free range. Those advisers who tell you otherwise are just prejudiced and don't know. I have raised and kept fowls that way for ten years.

If you can manage from your labor to now keep 25 hens, you consume most, if not all their eggs. Just add another unit, and have another coop, another twenty-five hens, and let them pay their own keep, separate from the first flock, and give you a little profit. As that profit grows, keep it separate, add a little to it, and build yourself a third unit. These two will more quickly enable you to add a fourth unit, and you will grow into the poultry business gradually, and experience as you grow, so there will be no failure.

No one ever made a failure in the poultry business. Many who have thought to start, failed to get started, because they did not have sufficient either of capital or experience. One who quits his job and buys 75 pullets or 200 baby chicks, or double these numbers has failed already, because he will consume all they would produce and go hungry.

Imagine how many a man has become an apiarist—a bee man. A swarm lit on his apple tree, and he hived it in a box. Getting

24 Hens Average 183 Eggs in 12 Months

Bought Old Hens Sent to Market Gave Over 4300 Eggs in Year

"I am not an experienced poultry-man, but will tell you my experience in using Giles Poultry-Tone. I bought a crate of 24 Leghorn hens from a South Water Street commission man. I commenced giving them Poultry Tone, according to directions, twice a day for 10 days. In the meantime they had commenced to lay. I continued to give them this mixture three or four times a week. For twelve consecutive months, 1 year, I kept an accurate account of the eggs received from these hens. They gave me 4,392 eggs. Experienced poultry men told me this was an exceptional yield of eggs, especially as the hens were old."

(Signed) J. J. Bonner, Chicago, Ill.

"Giles" POULTRY TONE

Send your order today for this wonderful efficient tonic-conditioner if you want a lot of high priced water eggs. POULTRY TONE puts your fowls in highest state of health and vigor, and keeps them there.

"Giles" POULTRY TONE will greatly increase egg production because it increases the appetite, aids digestion, makes the bowels more active. It tones up the egg-making organs, and gets the eggs, no matter how wet or cold the weather. Mr. Bonner's experience is proof of that.

PREVENTS AND CURES COLDS-ROUP-CHOLERA
POULTRY TONE overcomes and expels all germ poisons. It combats the germs that cause Roup and Cholera and it tones up the system so the chickens can resist disease. It affords prompt and permanent relief.

MONEY-BACK GUARANTEE

POULTRY TONE is a real Poultry remedy and tonic. Always sold on money-back guarantee. If not satisfied. On the market 20 years without a single request for refund. Try Poultry Tone on this plan. You can't afford to be without it. It's a sure money-maker for you.

Price, 50 cents large bottle; quart can, equals ten 50 cent bottles, \$2.50, prepaid. Send for big circular Poultry Welfare. It's free. Send your order today.

interested with the little duffers he bought a hive, and next year they swarmed, and after a number of years, without intending to have an apiary, he has one, and has learned the business without intending to. That is the way to get in the poultry business. Those who invest their \$5,000 may not have another \$5,000 to keep going, or to start over again, if from lack of experience, that 4,000 of baby chicks they started with, pile up over one another on cold nights and leave the beginning with a straggling few.

There is nothing that beats experience. With it, you do not need much capital. Without it, you soon lose what you have.

Colo.

J. A. Tracy.

Feeding Farm Hens.

Have you even heard people tell about the large number of eggs they were getting when eggs were scarce?

Then some one asks, "What breed of chickens have you?" I raise White Plymouth Rocks. I believe the most important factor in egg production is not the breed but the feed, and next the strain of fowls you have.

I remember very well when I was a boy, my mother, who cared for the poultry, had never fed balanced rations. She wanted to sell a few of the poorest of her hens. I had been studying agriculture in the country school, reading of balanced rations, etc. I decided I wanted to find out if those hens could be made to lay by feeding them a ration that was calculated to produce eggs. So I built a pen and put the hens in it which I had secured from my mother's flock. In yarding these birds I took them from the farm range, where they had been obtaining their feed along with the hogs.

These hens were fed a ration that any farmer can duplicate, consisting of equal parts of corn, wheat, and oats, and a mash of three parts ground corn and one part meat scraps. (What milk they will drink will take the place of meat scraps.)

Not one of these hens were laying when I penned them, but in less than two weeks every one was laying and they had changed to almost beautiful birds with bright red combs.

In connection I gave them plenty of grit, green feed and water. Sprouted oats make a splendid green food. I have planted a patch of beet mangels for green food for my hens this winter.

It would not pay to shut hens from free farm range and give them balanced rations, but it does pay to see that they don't go to roost with partly filled crops or crops filled with food that does not provide the necessary variety together with animal protein.

Hens that are fed poor rations or that gather their own feed will live and even keep in fair health, but hens cannot produce an abundance of eggs at all seasons on such rations.

Some expect their hens to lay well if they feed them all they can eat. But how can you expect a hen to lay eggs, a cow to give milk, or a man to work if the feed does not contain the elements that eggs, milk, and active work take from the body?

Mo.

DISEASES OF POULTRY

By D. V. Salmon. 252 pages; 72 illustrations. Every poultryman needs this book. The cause, symptoms, care and remedies for each disease fowls are subject to are given. Price 75c. American Poultry Journal Pub. Co. 523 Plymouth Court, Chicago, Illinois

each case the condition of the food is the main consideration.

In the refrigeration of poultry, the birds selected must be absolutely free of disease. After killing they are pre-cooled to remove any body heat, then placed in cold storage. It is stated on the best authority that turkeys are far better when they have been in cold storage. Ninety per cent of all turkeys are marketed in the fall and then held in cold storage until Thanksgiving, Christmas or New Years, when turkey is the popular bird, otherwise it would not be possible to supply the great demand for turkeys at this time.

Before cold storage facilities were available, during the time of plenty the prices were naturally low and during the time of scarcity, extremely high. Now cold storage houses enable us to have practically as steady a supply during the period of non-production as during the period of greatest production. It is a most necessary and healthful form of food preservation, and it is to be regretted that every one does not understand its importance.

The average housewife thinks that all cold storage foods are frozen foods. Quantities of fruit as well as other things are kept in cold storage at a temperature that preserves, but does not freeze.

When buying a cold storage fowl, choose a bird with white skin and a plump, round breast, rather than one with a long breast and yellow skin, if you want one of fine texture and flavor. Often you will see some one select a chicken with bunches of fat inside as well as immediately under the skin, but the expert chef in the best hotels would throw it away rather than serve it. The best chicken has the fat evenly distributed in small globules throughout the flesh so that when it is cooked it is rich, juicy and sweet. This means the chicken has been properly fed with not too much corn.

If possible select a dressed fowl, rub your hand over the skin and never accept one that feels slippery or slimy, for this means it is in bad condition.

It is best to buy the fowl in its frozen state, just as it comes from cold storage because once a cold storage chicken begins to thaw it decomposes quickly. It should be thawed in ice-water and then cooked immediately afterward, never allowing it to get warm. Treated in this way they are delicious, the meat tender and sweet and an entirely wholesome food. If the chicken is purchased already thawed in the market, clean and cook immediately.

A friend of mine told me that he took home with him two cold storage fowls. He cooked one and gave the other to his neighbor. The next day she called to him and asked him where he had purchased the bird, saying that it was the best one they had had in years. This man was a scientist and the chicken he gave to his neighbor was one he had kept in cold storage for five years, having held it as an experiment.

In England a chicken is not considered first class until it has been kept in a frozen state for some time. Many first-class restaurants, too, in this country serve only cold storage chickens, claiming they are the only ones which satisfy their patrons. The economic argument against cold storage is as unsound as is the attack against the healthfulness of properly handled cold storage foods.

Secrets of Expert Exhibitors

And Easy Lessons in Judging

By FRANK HECK

THE time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition. Most interesting book ever published for breeders.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class. You need this book to protect yourself against dishonesty.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained

You need the book to protect yourself against the dishonest fakir and you need it to put yourself on an equal footing with your honest competitors. It will save you many dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. Have you ever bought a poultry book on general topics or disclosing some system or so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well, this is not that kind of a book! **Don't put off sending your order. You need the book \$2.00 NOW.** The price of the book is, including postage, **\$2.00**

An Ordinary Producer of Ordinary Chickens.

I live in a small town of about 1,000 population. For the past fifteen years I have given some attention to the raising of chickens in a small way. I have not given much consideration to the raising of exhibition stock or to a pure breed, but have given more direct consideration to what was most desirable for my particular case. I have a run about 75 by 150 feet and the chickens are kept in this one space the year around.

After trying various breeds I selected the Barred Plymouth Rock as the strain that is best adapted to limited space. My reasons are that they are more healthy, more domesticated in all their traits, better to eat or to market and have a greater annual egg production than any other variety which I have tried.

I generally keep from 50 to 75 hens and one cockerel. With this size flock it is easy to give almost individual attention to each hen and when diseased can be taken out for treatment or killed as the case may demand. Also when hens cease to be profitable for egg production they can be marketed.

I have found that this is about as large a flock of poultry as I can handle with profit with the time I have to give to each and like everything else the dividends are largely in proportion to the attention given. There are some things which must be given constant attention in order to keep the flock healthy, contented and productive. As of these I would put cleanliness first. I keep my watering and feeding vessels clean and about three times a week thoroughly clean the hen house, removing all droppings and making close observation for the appearance of any vermin. If there is any lice or other vermin in evidence I thoroughly spray all the roosts and sides of the building to kill the eggs. About as good and as cheap a solution for this purpose as I have found is common kerosene.

One of the main points in egg production is proper rations. I feed my chickens corn and I always shell it for them so that they can eat it without effort. I also feed soft wheat brand mixed with about one-fourth shorts, twice a day. I always mix this with boiling water and feed it while still moderately warm. Once each day I give them a feed of green stuff when obtain-

able. I find that blue grass cut with a lawn mower, lettuce, beet tops, cabbage, celery cabbage, Swiss chard and other rapid growing vegetables are particularly adapted to hens which have no range to select their own green stuffs. In the fall of the year I find they like minced apples, beets, tomatoes. I feed my hens a green feed shortly after noon and feed their regular rations in the morning and about 4 o'clock in the afternoon.

Last, but not least, treat your flock with kindness. Do not frighten them or speak unkindly to them, but teach them that they can trust you. Some of the best fanciers can pick up individuals of their flock and pet them and they will enjoy it. Hens are not much different than humans. The more considerate and thoughtful you are for their welfare the more they will do in egg production to return your investment.

Illinois.

STOPS PREVENTS ROUP

SID SMITH SAYS: Last year my O. D. Mitchell's Roup Germicide was used on high priced poultry at the big Chicago Coliseum and Stockyards Poultry Shows where it saved the lives of valuable prize winning birds. That's proof it ought to be good enough for you, isn't it? I want to prove to you that it's the very best preventive and cure for Colds, Roup and Cholera you ever used. Use it as a preventive and keep your flock well. No matter how bad your chickens may be, I positively will guarantee a cure. 3 sizes: 50c, \$1.00, or \$3.00, postpaid.

1000 Eggs in Every Hen

New System of Poultry Keeping—Get Dollar A Dozen Eggs—Famous Poultryman

TELLS HOW

"The great trouble with the poultry business has always been that the laying life of a hen was too short," says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years Editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through cold winter months when eggs are highest; triple egg production; make slacker hens hustle; \$5.00 profit from every hen in six winter months. These and many other money-making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how, if you keep chickens and want them to make money for you. Cut out this ad and send it with your name and address to Henry Trafford, Suite 860-C, Court Bldg., Binghamton, N. Y., and a free copy of "THE 1,000 EGG HEN" will be sent by return mail.

CLOSE-TO-NATURE SPROUTER

Makes your dry lots profitable in summer and brings the eggs all winter. Pays a dividend every month in the twelve. The best investment you can make in the poultry line. We are the originators of the grain sprouter and we make all kinds and all sizes, from a few hens to 1,000. Ask for our circular on "Sprouted Oats and Eggs."

CLOSE-TO-NATURE COMPANY, 38 FRONT STREET, COLFAX, IA.

KILL LICE

THE BEST AND SURE WAY

Protect your fowls from the powerful and insidious lice and mites that suck the life-blood of your birds.

These parasites allowed to run rampant in a hen house will suck more blood, more vitality over night than fowls can replace by the assimilation of large quantities of food during the day—think this over.

Extra care must be taken that not only the birds are kept clean, but every crack and crevice as well

Licecil

Kills Lice

**No dusting—No dipping—No painting
—Just hang up the bottle**

—and in a few days your entire flock and hen house will be rid of every louse and mite. Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

How to Use Licecil

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

1 Bottle, \$1.00; 3 Bottles, \$2.50; 12 Bottles, \$9.00—All Postpaid.

American Supply Company, Dept. 54, Quincy, Illinois

Chicken Mites Filled
With the Life Blood
of Faithful Hens.

THE END.

Evidence!

KEEPS ON USING LICECIL.
Please find chacks for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.

J. D. ALLEN, Lynchburg, Va..

WANTS MORE.

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.

JOHN HOLTRAP, Lynden, Wash.

KEEPS ON USING IT.

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.

J. E. PLATT, Maywood, Ill.

LITTLE WORRY OR WORK.

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.

BERNARD F. OSTERFIELD,
Dayton, Ohio.

SEND MORE.

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.

L. G. STAYNOS,
Sherman, Texas.

BIG Commercial Poultry Plants

Now FEEDING the

FUL-O-PEP WAY

One of the surest indications that the Ful-O-Pep Way of raising poultry is the most successful, is in the fact that many of the largest commercial poultry plants in the country have adopted it in preference to all other methods.

Here are views of a few of the big plants that are having wonderful successes the Ful-O-Pep Way. Big Commercial Poultry Farms all over the country have found that birds fed Ful-O-Pep Feeds, according to the Ful-O-Pep Way, make more rapid healthy growth at less cost than with any other method of feeding—it's the one sure way to poultry success.

Write for Free Ful-O-Pep Calendar

Send us your name and address and we will send you free, our new 1922 Ful-O-Pep Calendar, telling all about the Ful-O-Pep Way. Our new

Ful-O-Pep Calendar is better than ever—it's one of the most valuable books ever published for poultry raisers—contains pages for keeping record of eggs—account pages for recording expenses and receipts from your flock as well as complete particulars of how to raise poultry the Ful-O-Pep Way—this book is written by Albert Angell, Jr., in a simple "easy to understand" way. Write for it today.

INTERNATIONAL HEADQUARTERS

"Aristocrat" Barred Rocks

The World's Greatest Strain of Poultry

**The
Great
Money Makers**

Supreme as

—Showbirds

Supreme as

—Layers

Supreme as

—Market Fowl

AS SHOWBIRDS

The famous Aristocrat Barred Rocks have created a new WORLD'S RECORD by their sensational sweep of victories in thousands of showrooms, including the largest and biggest Barred Rock shows of the entire world. The NATIONAL B. R. CLUB SHOW (the greatest of all the great ones) CHICAGO, "HEART-OF-AMERICA," BOSTON, N. Y. PALACE, GUELPH, DALLAS, LOS ANGELES, "TRI-STATE," BROOKLYN, CLEVELAND, NEW ORLEANS, ST. LOUIS, WINNIPEG, PITTSBURGH, INDIANAPOLIS, MINNEAPOLIS, SAN FRANCISCO, DETROIT, etc., etc., hail the Aristocrats as winners! MY CUSTOMERS ARE WINNING OUT WITH "ARISTOCRATS" ALL OVER THE WORLD.

AS LAYERS

The same magnificent showbirds are equally supreme as layers. THREE HUNDRED SIXTY-ONE (361) EGGS FROM ONE MOULT TO THE NEXT BY AN "ARISTOCRAT" HEN IS UNDOUBTEDLY THE LAYING RECORD OF THE WORLD. Equally matchless is the record of 260 eggs in 270 consecutive days by another "Aristocrat" hen. Many "Aristocrat" cockerels from my great laying record hens have been sold to State Agricultural Colleges. (Only yesterday I received a report from one of these colleges giving a record of 79 eggs in 79 days.) Can better evidence of their value be given?—From all over the civilized world "Aristocrat" customers are sending in glowing reports and laying records.

THE IDEAL MONEY-MAKING COMBINATION

EVERY WISE, PRUDENT BREEDER WILL DO WELL RIGHT NOW TO LOOK FOR THE GREATEST MONEY-MAKING COMBINATION IN POULTRY THAT HE CAN POSSIBLY GET. Let every breeder who reads this give some serious thought to this vital subject—WHY NOT BREED THE GREATEST SHOW-BIRDS, THE GREATEST LAYERS, THE GREATEST MARKET FOWL—ALL COMBINED IN ONE? This is the combination which will give you MORE profit, MORE honor, MORE pleasure, MORE satisfaction than any other. This you get in "Aristocrats."

GRAND NEW CATALOG—FREE

Remember: Holterman is the man who is furnishing to other breeders so many of those powerful winners in the world's foremost shows.

BYERS' ORPINGTONS

If you would own this kind, buy into the Strain that produces them.

Byers' Orpingtons Stand Supreme

and have become the Standard Strain of all America. Twenty years of continuous, constructive breeding; my late unparalleled Winnings at the great Chicago Coliseum Shows and my square deal policy in every transaction, unfolds the reason.

If you will take the trouble to examine the leading poultry journals of the past 15 years, you will find Byers' Orpingtons advertised by the writer. You will also find the advertising of various other Orpington men who got into the limelight one or two seasons and were heard of no more. So it is now and that is why for years I have endeavored to convey to you the double importance of my continuous, constructive, successful, permanent Orpington breeding as an exclusive business without interruption or intermission. When you appreciate that feature and buy accordingly you will succeed. It means everything to you as a purchaser of permanently dependable stock.

PRICES:

Birds of rare standard excellence capable of winning this month at state shows: Cocks and cockerels, \$50 each; hens and pullets, \$25 each; old or young pens (4 females and male), \$125. Birds to win at less important shows half the above prices: Big breeding cockerels, \$10 each; two for \$18; four for \$32. (These big fellows would improve 80 percent of the flocks of America.)

C. S. BYERS (The Best Breed Bred Right 20 Years) **HAZELRIGG, IND.**

From My Champions

this season I have bred the finest line of 1921 early show Winners ever offered. Come to my plant for an interview or a purchase or place your order by letter which insures exactly the same maximum value as your personal selection would afford, subject always to your approval or refund of your money.

Owen Farms

Single Comb Rhode Island
Reds and Buff Orpingtons

Stand Pre-eminent

Their outstanding leadership has been established by crashing victories at Madison Square Garden, New York; Boston; Chicago; Kansas City; Pittsburgh; Syracuse; and nearly all the other shows on the continent. A complete list of their winnings would be a nearly complete index of all poultry shows.

1921 REDS

are wonderful in their uniformity of type and color. Perfect health and vitality, with plenty of size and bone are possessed by every cockerel and pullet. Raised on free range and bred for egg capacity. If you want Reds that are even, velvety dark color, have wide backs and wide spread tails you will find them here. My entire flock have exceptionally good combs, red eyes and strong black markings.

1921 BUFFS

are the smooth, soft, even golden buff color with sound wings and tails that have done so much for the leading Buff flocks in the country and held the supremacy of the Owen Farms Buffs for sixteen years. Real Orpington type without exaggeration of feathering, yet massive and the type that lays early and often. If you want real lasting color combined with real Orpington type, you will find them here.

1921 PRICES

All ordinary cockerels have been marketed. Only really promising birds have been matured under free range conditions. Good breeding cockerels at \$7.50; \$10.00 and \$15.00 each; choice breeders and good show birds at \$25.00; \$35.00 and \$50.00 each. A few exceptional cockerels for the hottest shows at prices you will gladly pay. Pullets—good breeders at \$5.00; \$7.50 and \$10.00 each; choice breeding and show pullets at \$15.00; \$25.00 and \$35.00 each. A few wonderful show pullets at higher prices. A few choice cocks and hens a matter for correspondence.

Send me the amount you wish to invest. Tell me exactly what you wish to accomplish. If you are showing, name your show. I will personally select your birds for you and mate them as carefully as I do my own pens. Your permanent lasting satisfaction and success is my aim.

VISITORS

are always welcome. Have never known one to be disappointed with what they found here. They are a unit in saying they "Never expected to find such quality in such quantity." Come and see for yourself if you can. If not, come to me on paper. Will try and help you in any way in my power and am interested in all your plans for bettering your Reds. An order for utility birds will have the same careful handling as for high priced show birds. Try Owen Farms and see what Golden Rule treatment means when applied to the poultry business.

SIX GENERATIONS OF BREEDING FOR EGGS

How a High-Producing Strain of Exhibition S. C. White Leghorns Was Built Up on the U. S. Government Farm—A Cockerel of Standard Quality With Five Generations of 200 Egg Hens Behind Him.

By F. L. Platt

THE breeder sums up the prolificness of his hens in one word, fecundity. It is not wholly a visible character. And since it cannot be measured with infallible accuracy by outward signs that are perceptible by the eye, no one knows for sure just how prolific a layer a hen may be until he has trap-nested her. He then does not know just how well that female will transmit high egg production to her daughters, and cannot know until he has hatched some of her eggs, grown the pullets and trap-nested them. And then it will be found that the sire has exerted as much, perhaps more influence than the dam on the fecundity of the pullets.

Feeding the eggs out of a female is more of a science than purifying the blood lines for high fecund power through breeding. It is true, however, that handling and feeding hens so that they will lay a very large number of eggs prior to the breeding season, commonly wears down the average bird to a point where the eggs that she produces for hatching do not have the maximum strength to highly endow the chicks that are hatched from them. This biological condition at the time of maternity adds to the problem of perpetuating high production in a straight line of descent from one generation to another.

The possibility of weakness is overcome only by retaining birds of outstanding vigor, and then hatching from females after they have made high egg records as pullets, molted and recuperated as hens.

Even then it appears to be more satisfactory to breed from females whose production has been high but has not run to an extreme degree of highness. Prof. James Dryden has cited the fact that there is no record of a 300-egg hen having produced a 300-egg pullet, that there is no single case of a 300-egg hen that has had a mother that was a 300-egg hen.

If the aim of the breeder is to simply increase the fecund powers of his flock, his problem is much simpler than though he should aim at the same time to also improve the external characters, such as shape of comb, carriage and style of body, beauty of plumage, etc.

Those who are particularly interested in utility sometimes exclude consideration of external characters, saying that they are interested only in the internal quality of fecundity. It is a noteworthy fact, however, that they do not take up mongrel chickens, although a mongrel flock can be bred and highly developed for the one factor of fecundity as easily as a purebred flock, and the mongrel chickens can be fed to lay as well as the others. Utility poultrymen do not take up mongrels, because they want that uniformity of size, temperament and color in their birds, which can only be secured in purebred stock.

It is these qualities of size and shape, with which temperament is associated, and evenness of plumage color that the fancier-breeder established in the beginning and now aims to perfect along with the perfection of utility qualities. These external qualities, moreover, possess market value, for "sight sells first." Ship a man a high-tailed, coarse combed, straw-colored White Leghorn cockerel for \$50, and no matter how highly bred for eggs he may be, it is nine chances out of ten that the bird will come back. The invisible factor may be in the bird, but what the buyer can see is deficient.

When the utility poultryman gets the cockerel back, refunds to the purchaser \$50 in coin of the realm, and then consigns to market, at market prices of so much per pound, a number of his surplus males because their outward quality is deficient, he realizes that specialized breeding for the one factor of fecundity, while a practical basis

on which to produce layers for an egg farm, is not a practical basis on which to maintain a breeding establishment.

It is well that this is true. Upon some group of breeders must devolve the responsibility of maintaining the breeds in their general, all around excellence—an excellence of form and symmetry, as well as fecundity.

Standard Exhibition Poultry Lays.

That usefulness and Standard breed character can be combined has been illustrated in the birds of countless

"Lamon's Triumph," a Single Comb White Leghorn cockerel of Standard exhibition quality, and out of a line of 200 egg hens. Hatched in 1921 on U. S. Government Poultry Farm. His pedigree appears on the following page.

A 240 and 235 egg hen. Hen in Fig. 11, although a good layer was discarded because of off type.

breeders over the length and breadth of the land, ever since poultry keeping began to attain any standing worth mentioning, but never has this combination of beauty and utility been illustrated in as tangible and authoritative a way as in the breeding work of the U. S. Department of Agriculture on the Government Farm at Beltsville, Md. The breeding work there is under the direction of Harry M. Lamon, who was a judge and practical breeder of Standard exhibition poultry for twenty years before he took charge of the poultry work for the Animal Husbandry Division of the Federal Department, and built and stocked for the Government, the largest poultry experiment station in the world.

When we visited this plant in September, Mr. Lamon commented on the fact that richness of pedigree, while it should be a very valuable asset in a bird, was, in point of fact, a rarity in most high egg-bred birds; and then he picked up a Single Comb White Leghorn cockerel whose dam, grandam and great grandam had records of over 200 eggs, and he was a bird that, in addition to being out of an egg-bred family, possessed the external characters which all fanciers and judges pronounce good. Fig. 1.

This cockerel had a neat comb, fine in texture, without the coarse papilla of goose flesh; bright, bay-colored eye; nicely rounded wattles; trim body of graceful lines; a low tail, with the base of the tail showing a wealth of furnishing in the form of coverts and lesser sickles just

coming out. His plumage was pure white. In no way did he meet any of those objections referred to in the Standard in that line which reads: "Short backs, short shanks and short bodies are objectionable."

Upon our return to Washington, the following day, Rob. Slocum and Joseph Quinn kindly looked up the full pedigree of this cockerel, and we reproduce herewith the records of breeding of this bird, that is, the successive generations which preceded the birth of this cockerel.

The Result of Selective Breeding.

There is no systematized and cut-and-dried rule for the breeding of high egg production with which is combined superior Standard quality, other than the old method of selection and elimination.

Mr. Lamon does not attach special importance to inbreeding. He says: "In breeding for improvement in egg production, it frequently happens that in order to get ancestry on both sides which has high production back of it, the fowls are rather closely inbred."

The accompanying pedigree shows that male No. 756 appears four times in the first generation. He headed pen 8. In the second generation, not only his offspring appear, but he again appears twice. This increase in the flock of the blood of a single individual is the very essence of inbreeding.

Male No. 756 was an important stock bird on the Government Farm, and in referring to the employment of a prepotent sire of this kind, Mr. Lamon says: "Any male which may be discovered to be a particularly prepotent individual with respect to his ability to transmit high egg production, should be preserved and mated as long as he is in good breeding condition and his blood should be spread through the flock as widely as possible."

While Mr. Lamon subscribes to the theory that the male is an important factor in transmitting fecundity, he attaches much importance to the female, believing that you must have the female first, before you can have the egg to produce the male. "In general," he adds, "the problem of breeding for improved egg production may be reduced in its simplest terms to the proposition of breeding from the higher producers in the flock and discarding as breeders, the lower producers." This method of selection necessarily involves the use of trap nests.

Among the great hens on the Government Farm, not only as layers but also as breeders, is old No. 408, who

Pedigree of cockerel shown in Fig. 1. Five generations of 200-egg females are back of him on his dam's side. Males in the pedigree are shown at the top, females at the bottom of each bracket.

The hen and cock in Figs. 2 and 5 appear in the pedigree of the cockerel, Lamon's Triumph. The pullet and cockerel in Figs. 3 and 4 illustrate the high quality of S. C. White Leghorns that this line of breeding has produced.

appears in the first generation of the accompanying pedigree. She laid 214 eggs in her pullet year, 779 eggs in five years, and 910 eggs to date. (Fig. 2.)

One of the best cockerels from dam No. 408, was mated to another great hen, which laid 213 eggs as a pullet. She appears in the second generation as No. 514. This hen, 514, laid 536 eggs in three years, and produced elegant Standard quality. Fig. 3 shows one of her daughters, which laid 206 eggs in her pullet year.

The males from this line were equally attractive. Fig. 4 illustrates a grandson of hen No. 514. He is big show quality in a S. C. White Leghorn male; yet eight of his sisters and half sisters produced as follows in their pullet year: 180, 187, 195, 196, 198, 208, 235, and 240 eggs.

Hen 408 as the grandam, and hen 514 as the dam, produced a cockerel that, in the third generation of the pedigree, was mated to hen No. 2086. This hen laid 223 eggs. Her own sire was the elegant White Leghorn male, No. 610, which is shown in Fig. 5. Right along you see, Mr. Lamon is getting high egg production combined with high Standard quality.

The union in the third generation of male No. 3495, whose dam and grandam were 200-egg hens, with female No. 2086, which laid 223 eggs, produced hen No. 4017, which laid 245 eggs in one year. (Fig. 6.)

A Study of Pedigrees.

It is a little tedious to follow a pedigree. Poultrymen have been singularly free from pedigree study, although all breeders of cattle, horses and hogs have had to burn midnight oil in studying pedigrees and ferreting out sound lines of breeding that traced back to prepotent and valuable animals in the pedigree. Nearly every prominent and successful live stock man is an adept on pedigrees and can quote the more important lines of breeding from memory. They all maintain that there is a great fascination in line breeding as revealed by a pedigree, once one becomes accustomed to such studies.

So let us go back and pick up the silver thread of

ancestry that runs from the 4th to the 5th generation. Here we find that male No. 4876 was selected to mate to the 245 egg hen, No. 4017. He is shown in Fig. 7, and she in Fig. 6. This male is not only a Leghorn that many a fancy breeder would like to own, but he comes from egg bred parentage. His grandam, No. 2186, had laid 202 eggs. His dam laid 191 eggs in her second year. She was a great breeder of good cockerels, producing not only the male in Fig. 7, but the other good ones shown in Figs. 8 and 9. Three such cockerels as these in a row would be an attraction in any poultry show.

When No. 4876 was mated to hen No. 4017, the union produced hen No. 6602, which at the time of our visit to the Farm, September 12, 1921, had laid 206 eggs. Her record began November 1, 1920, and she still had 49 days to go before her year was up. Her record of 206 to date was, therefore, incomplete.

This hen is the mother of the cockerel, Lamon's Triumph, which has five generations of 200 egg hens back of him on his dam's side.

Now let us observe his sire's pedigree. On his sire's side, his father's mother, hen No. 2036, laid 208 eggs in a year. His sire's grandam, hen No. 2058, which appears in the third generation, laid 240 eggs. She is shown in Fig. 10. In her first two years of laying, she produced 418 eggs and as a five-year-old has laid 815 eggs to date, and is still laying.

Inbreeding and Linebreeding.

The male that was mated to hen No. 2058 is the same male that was used in the same year to mate to hen No. 1923. Thus it is seen that the same male, No. 3496, appears on both the sire and dam side of the pedigree in the third generation. This means that the great grandsire of Lamon's Triumph, on both his sire's and dam's side, was the same male, No. 3496. He alone was the sire of the only two males used in the fourth generation, which were full brothers, each having the same sire, but different dams.

In the 5th generation, the (Continued on page 1003)

Figs. 6 and 7 appear close-up in the pedigree of the 1921 cockerel, Lamon's Triumph. The males in Figs. 8 and 9 are full brothers of the male in Fig. 7, and show that Standard quality can be consistently produced along with the factor for high egg production.

Causes that Help to Make Cull Chickens

Many Flocks Are Being Culled—The Presence of Culls Raises the Questions of Where They Came From and What Produced Them—How to Minimize the Production of Culls.

By T. S. Townsley

MUCH attention has been paid during recent years to methods of detecting and eliminating the culls from the flock, and without question the poultry industry has been very greatly benefited by the development and application of modern culling methods. However, detecting and stimulating the culls has not and will not entirely and permanently clean up a flock as long as other causes contribute to the production of inferior specimens. There appears to be room at this time for much study of the various factors that are responsible for cull chickens being raised.

The following observations upon the causes of the appearance of such a large number of culls in most poultry flocks are based upon a practical experience in handling the hens and young stock in the yards of several hundred poultry breeders widely distributed over the state of Missouri. The conditions under which poultry are raised and kept in Missouri apparently do not vary widely from conditions in the majority of the other important poultry raising districts, and conversation with observers in other states leads to the belief that the reasons are much the same for the production of culls in all poultry raising sections.

A scientist looking for the factors which produce cull stock probably would say that they included hereditary, environmental and nutritional influences. The same thing may be expressed in every-day English by saying that culls may result from the use of a poor type of breeding stock, inadequate or improper care, and insufficient feed or the wrong kinds of feed.

Breeding Stock Is First Factor.

That the breeding stock used tends to perpetuate culls in many flocks can be easily demonstrated by observation in the poultry yard. Even where culling methods are understood and applied, the lack of appreciation of the importance of constitutional vigor in breeding stock is quite remarkable. One of the most common questions asked of poultry extension workers is the inquiry as to what is meant by a crow head, and the difference in width of back on a vigorous bird and a weakling is entirely unknown to a large majority of poultry keepers. Indeed, a lack of understanding of the fundamentals of a chicken is too general. At a recent state poultry meeting two nationally known breeders were blindfolded and asked to tell which of two trapnested hens was the best layer by feeling the width of the back. Both of these men chose a pinch-backed hen as the best producer, which was exactly opposite the actual fact. The champion Rhode Island White cockerel in one of the large city shows last winter had a crow head and a very narrow chest and back. His owner used him to head a breeding pen this season and has produced a number of cockerels, three-fourths of which are typical crow-headed, pinch-backed culls. As long as knock-kneed, pinch-backed, crow-headed, poor-laying stock is permitted to reproduce itself through the breeding pen, the perpetuation of culls is inevitable, because the law that "like tends to produce like" holds full sway in poultry breeding, particularly when there is any weakness to be reproduced.

That a considerable portion of the cull stock in the country is due to poor management must be the conclusion of anyone who studies the development of birds from the same flock under the care of different persons. In one flock where the breeding stock had been carefully selected for vigor and producing ability, the majority of the chicks were raised by the flock owner under crowded conditions and without a satisfactory means of applying heat during the brooding season. Considerable more than half of these chickens developed to be worthless culls. The flock owner's daughter joined a poultry club and set some of the eggs from the same stock, and by giving her chicks good care with regard to brooding temperatures and feeding methods, raised a flock that was entirely free from culls and showed 100 percent improvement over the chicks raised by her father from the same breeding pen.

The time of hatching is one important factor affecting the percent of culls. In Missouri, chicks that are hatched after May 1 show a very large proportion of under sized, poorly-developed, low-producing stock, while those hatched during March and April, if given proper attention with regard to feed and brooding, will show a comparatively small percent of culls. A good start influences growth.

Close confinement, overcrowding, lack of heat in brooding quarters and scarcity of green feed are important management factors in increasing the output of cull stock. The proportion of culls from chicks raised in fireless brooders compared with those given the proper degree of heat, is very noticeable in many cases. Then, again, overcrowding plays an important part in stunting and dwarfing the young stock.

One of the most certain means of increasing the output of culls is to try to raise chicks of different ages under the same brooder. Close

confinement of the growing stock limits the amount of exercise and increases the danger of disease and parasite infection with the result that chicks raised in close quarters usually show a great many inferior specimens. The amount of green stuff which growing chicks will consume, if given the opportunity, is truly remarkable, and growing conditions which deprive them of this natural food has a tendency to dwarf and weaken them with the result that many culls are produced.

Breeders are gradually learning their lesson with regard to the importance of early hatching, proper brooding temperatures, and free range for the growing stock with the result that culls resulting from mismanagement are becoming fewer each year.

Correct Feeding Very Important.

Perhaps the most potent factor in producing cull chickens is the lack of proper feed for both growing and laying stock. Poultry keepers have been slow to grasp the importance of animal protein in the ration to insure the full body development of the chicks, and a large percent of the cull stock can be traced directly to this deficiency. In many cases no effort is made to provide animal protein except what may be occasionally available in surplus milk or waste meat scraps from the (Continued on page 998)

A well bred, well fed, well grown lot of Columbian Wyandotte pullets. Insanitary housing during the Winter, or lack of feed, may result in these birds running down constitutionally so that a part of them will be cull hens next Summer. Some culls are bred; others are made by the caretaker.

The Poultryman and the Poultry Show

No Poultry Raiser Should Fail to Attend a Good Poultry Exhibition When He Gets the Opportunity—365 Days of Work at Home Makes Too Full a Year—Take a Day Off for the Show.

By Willard C. Thompson

THE autumn season is here! This is a season full of importance and significance to the poultry raisers. There is not any other time of the year that is of greater interest to that big crowd of American people who are classed as chicken raisers. Why? There are many reasons that upon a little thought come to the forefront. The results of the rearing of the chicks from early spring through the summer months begin to appear. Pullets begin to spring comb, develop body, and show other signs that indicate that they are almost ready to start laying and therefore, start to count as members of the laying flocks. Cockerels are beginning to take shape, fill out, and look like more than huge frames. Old birds are finishing the molt and are beginning to look better in their new fall suits of plumage, new feathers, rested and full-of-pep constitutions, and they are showing that condition and musculinity which indicates that they are in shape to go into the breeding pen for the purpose of reproducing their species in another spring.

But to the real poultry lover, the man or woman who is raising chickens because the work is pleasant, one of the most interesting things that the autumn season ushers in is the annual poultry exhibition or show. October and November see many a fine poultry show, and the later winter weeks will make room for many more. Poultry shows are rare opportunities for poultry enthusiasts to enthuse, to gain inspiration. There is not a poultry raiser in this country who should fail to attend a big poultry show when he gets the opportunity. If this be you who are reading this right now just take a minute or so to consider with the writer this proposition.

Poultry Shows were originated in America for the purpose of showing the public that progress was being made in the development of poultry breeds and methods of poultry breeding. Each year our poultry shows mark another chapter in this history of development, for the general quality of our poultry shows as a rule shows marked improvement year by year. Any one who will look back in periods of five years will not fail to see the rapid steps forward. No one has any right to be in the business of poultry production who is not interested in observing the improvement, and step ahead, that is taken in his industry each year. Poultry raisers, especially those who are in the work for all or the greater part of their income, must not stand still. They must progress. Their ideas must grow and their ideals ever be placed in advance of any accomplishment that they may have made.

Taking Part in the Show.

A very positive way in which this keeping up with the times may be realized is by attendance at the poultry shows. Therefore, in the first

place, let us appreciate that seeing nice birds, well groomed, carefully bred toward an ideal, selected with due regard for quality in form, shape, and color, and presented in attractive ways is an asset to every poultry raiser, even though he may be keeping his or her poultry mainly for eggs or meat and not for exhibition.

Poultry keeping as it is being developed in this country is becoming a more and more stable and steady business. The reason is to be found largely in the fact that there is a constant need for poultry products, and the supply has not and will not soon reach the demand; and the further fact that methods used in the business are becoming more standardized, tested, and proven, and the plans and practices more efficient and possible of profits. Poultry breeding lies back of all poultry production as a direct foundation stone on which the economy and efficiency of such production depends. The poultryman must have a good fowl before he can expect good products, on which there may accrue profits. Upon the fundamental health, vigor, and inherited values of the fowls in any flock will depend the degree of success which will be derived.

Purebred Fowls for Greatest Success.

The well-bred fowl is the backbone of poultry success. Now, it is as true that the man or woman who breeds such fowls is the poultry raiser who will gain success. The poultry breeder is a most essential part of the industry. Without him the quality of our American poultry would soon disappear. Practically every commercial poultryman, every suburban poultry keeper, or any other person raising chickens should be eventually a poultry breeder at least to some extent.

It is right and proper that some of us should be more interested in the breeding of fowls that are approaching the ideal than others. Particularly to this group of poultrymen does the poultry exhibition appeal each year as the crisp, cool days of autumn roll 'round. If you are raising purebred, and more particularly Standardbred poultry, there are definite reasons why you should enter some of these birds in some poultry show this winter. Let us enumerate these reasons and by the way, if you, my reader, are not raising this kind of chickens at present, get into line. The day of the purebred fowl is here, and good business forces one to keep that kind from now on.

Take an active part in some poultry show by entering birds, because it brings your birds to the attention of the public and forms, thereby a wonderful source of advertising. People are not going to come to buy your birds unless they know you have them to sell.

It affords you an opportunity to have your best birds passed upon by capable judges. Many a new exhibitor has found out to his surprise (Continued on page 990)

May not this boy have a day off to go to the poultry show? He has earned it. He will inject more enthusiasm into his work, and take closer note of the quality and condition of the birds in the laying house, after a visit to the noisy, merry show room where Kings and Queens of Fowldom are in their coronation robes.

THE PHILOSOPHY OF A FANCIER-BREEDER

What Does a Poultry Breeder Think About as He Carries the Feed Pail and Sizes Up His Birds Day by Day—A Few Good Thoughts and Pertinent Comments.

By C. S. Byers

MOST of us pursue happiness and satisfaction. Those who do not, should. A satisfied people prosper. Chaos follows dissatisfaction. Home environment makes for satisfaction or dissatisfaction. The ownership of certain things, within our practical means, encourages satisfaction in home life. Works of art, music, landscape gardening, animal and bird life all contribute to make home life pleasant and establish peace of mind and refinement of thought instead of inharmony, stupidity, melancholy, dissatisfaction, unhappiness.

The ownership and production of Standard, fancy, purebred poultry offers diversion, pleasure and profit to rich and poor alike. A hobby-ridden mind is more desirable than a lazy liver grouch. The late John Burroughs drew animation, enthusiasm, satisfaction, happiness from the wealth of glorious beauty in nature. His failure to solve the many mysteries of nature was, to him, a failure that revealed a lack of wisdom even in his brilliant and fertile mind.

The Poultry Fraternity.

Who are the fanciers of purebred poultry? Men and women in every pursuit of life from the humble shoe cobbler to officials of the United States Steel Corporation, doctors, lawyers, preachers, real estate men, bankers, sailors, miners, farmers. And where are they located? From frigid Alaska to Key West, Nova Scotia to distant Mexico, the Republics of South America and most of the oriental and occidental countries of the hemispheres. And as civilization advances during the next decade, thousands upon thousands of new fanciers will be created to take the product of the American breeders large and small, because we excel the world in the production and perfection of domestic fowl. Deeply interested and enthusiastic he starts with the variety that appeals to his fancy whether the chosen variety be popular or unpopular. As a rule he starts with cheap eggs or cheap birds and gets what he buys. Or he may start with high priced eggs or birds and get full value for his outlay. Being wholly unfamiliar with the breeding characteristics of his chosen variety he will very likely draw quick and radical conclusions as to the quality and worth of his product. The appearance of his chicks in various stages of immaturity may cause him to "view with alarm" their apparent defects which, when understood, are only natural breed characteristics that later disappear with the full development of the bird, and a valuable specimen results.

The novice will almost invariably look ten times to color and head points in a bird to once to type, and he will buy birds and breed birds accordingly. I will stand responsible for the statement that more failures on the part of amateur fanciers can be traced to the above erroneous policy than through all other causes. Then, too, the beginner may engage in the production of fowls (from mediocre, fair or choice parent stock) woefully deficient in the proper conception of handling and feeding for best results. Culls will result regardless of the merits of the parent stock. Excellent articles of advice on this all important subject have appeared in the American Poultry Journal, also items covering symptoms, prevention and cure of poultry ailments. So the amateur fancier pits his ignorance, radically or modestly, against the knowledge of his superiors in the fancy just as all of us once did. But the amateur fancier who is diligent, open to proper understanding, persevering and a worker will succeed, for he will remember that leaders in all legitimate human enterprises are but ordinary persons with extraordinary determination.

Again, the amateur may forget to bear in mind that superior blood lines (correct linebred ancestry) carry in-

visible but inestimable value in a mating, apart from the individual merits of specimens. When buying he may view the birds with critical eye, and skeptical ear to the advice of the experienced, successful and conscientious breeder who sells him the stock. To illustrate this he might find one bird in a scrub flock of 100 purebreds that appeals to him and he buys the bird for one dollar or one hundred dollars. That bird would carry absolutely no value as a breeder of superior stock. A Kiefer pear tree may be symmetrical and look like other pear trees but it will never produce any other than the mediocre, scrub Kiefer. The experienced fancier has attained his title and earned it through the school of experience. He has gained knowledge of certain prerequisites to a successful career as an actual producer. His experience has unfolded certain specific principles of breeding that he knows to be correct and he follows them cautiously. His keen observation and expert knowledge of breed characteristics enable him to mold better and even better specimens each year. He knows the worth of his best, yet defective birds, with a concrete but rather painful understanding that the perfect specimen has not yet been brought out. He realizes that the great contest is to closely approach the goal, not to reach it.

Perhaps the greatest failing or handicap of the average experienced fancier is a lack of business vision. This lack of business vision and initiative is the thief of his progress and profits. He needs to study the determined action and initiative of our captains of industry in other lines, including the leaders who promote prominent breeds of cattle, hogs, etc. I know of dyed-in-the-wool experienced fanciers who depend on local county trade for their output, whereas they could utilize the entire North American continent as their trade field through the medium of our best journals. If a few hundred more of these good fancier-breeders would thus respond they would reap dollars of profit instead of pennies and popularize their chosen variety. This would result in more and larger poultry shows, larger and better poultry journals with enormously increased circulation in North America as well as in foreign lands. And mark my prediction that a heavy foreign trade can and will be developed by American breeders through proper effort.

Stupidity and inactivity never sold even an article of merit. To develop a superior strain and fail to put it on the market erases profit to the breeder and delays the popularity of his variety. The interests of the poultry press of our land and the interests of breeders are mutual and inseparable. One will assist the other just in the degree that they exhibit vision and constructive, legitimate, business initiative.

Hobbies of the Fancier.

Most fanciers and some judges entertain hobbies when passing judgment and value on individual birds. As suggested elsewhere in this article, most novices look first to color and head points. They may personally select a fine colored bird with good head points "that just suits," and completely ignore or discard a far more valuable specimen, superior in type, but deficient in head or color.

He may sell a \$100 bird for \$10 because of slightly defective color and head points but a wonder in type. He may ask \$100 for a splendid colored bird that is woefully deficient in type. His standard of values and his estimation of merits and demerits is twisted and out of balance and will continue to be until he reaches a correct conception of values based on relative type and color features in individual specimens. Such novices (Continued on page 990)

FARM EGG PRODUCTION AND EGG PRICES

Under the Direction of Illinois Agricultural Association the Author Made a Survey of Egg Production in the United States, Together With Prices Paid to Farmers in Relation to Prices Paid in Cities.
By E. F. Murphy

FARMERS' organizations are beginning to interest themselves in the marketing of eggs and poultry, in common with the marketing of all farm products. There are two reasons for this. First, the importance of poultry and eggs as a source of revenue and profit to farmers. Second, the rapidly growing interest of farmers in the question of how farm products are handled after they leave the farm, how many hands they pass through and how much profit is extracted by each handler. In the following summary of conditions as I have found them I have tried to lay the foundation for a critical study of the matter:

According to the 1920 census figures, 32 per cent of the eggs produced in the United States are produced in the five corn belt states as follows:

Yearly Production In Dozens.

Iowa	120,697,319
Missouri	117,203,539
Illinois	105,757,907
Ohio	102,377,143
Indiana	83,101,293

The Pacific Coast states produce only about one-fifth as many eggs as the five corn belt states, but these coast states are more widely known as egg producing states because of their highly specialized co-operative marketing associations. Ohio or Illinois alone produces more eggs per year than all three of the Pacific Coast states. Census figures on the annual production in the corn belt states show that each county in this region produces on an average of over a million dozen a year.

According to the 1920 census figures, the Pacific Coast production in the states referred to is as follows:

Yearly Production In Dozens.

California	64,123,885
Washington	21,356,576
Oregon	14,625,720

There are other factors to be considered aside from quantity of production, viz.: that of quality. When the bulk of corn belt eggs were selling in New York City for an average of 25c a doz., the Pacific Coast eggs sold for 40c a doz. The Pacific Coast eggs sell readily and to great advantage because of the reputation those states have made for producing and selling a high quality egg, or, in other words, standardization of the product and reputation based on quality is worth 15c a dozen.

As eggs are bought at present in the corn belt states, for the most part, there is no incentive for producers to turn out a superior quality product. This does not mean in order to have a superior quality of product that the breeds of chickens in the corn belt states must be changed and Standardized, but it does mean that the breeds that exist today could be used in producing a standardized product in so far as quality is concerned. It would not be practical nor possible to expect corn belt farmers to specialize in egg producing breeds so long as the relative importance of other farm products attain a relatively high standard of value in comparison to eggs; but

in those sections where crops cannot be grown to bring forth other farm products, it might be possible for specialization in egg production. It would not be advisable either for corn belt farmers to retain their heavy breed flocks and attempt to force egg production and sacrifice the meat.

Comparative Value of Poultry Industry.

While the production of eggs and poultry in the corn belt states where most of the eggs of the country are produced is considered rather a side line, yet the importance of the poultry industry compared with other farm products is quite large. Taking Illinois, for example (which is in the heart of the corn belt area and is an average of these states):

The value of eggs produced in Illinois, excluding home use, \$40,188,005.

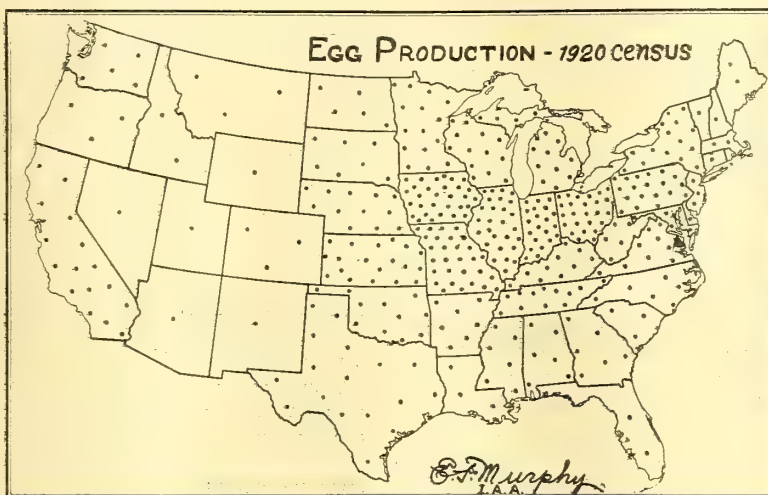

The value of chickens raised, \$27,502,080.

Total value of eggs excluding home use and also chickens raised, \$67,690,085.

Total value of all dairy products, excluding home use, of milk and cream, \$71,998,333.

Value of vegetables, including potatoes and sweet potatoes, \$31,351,407.

Total value of sheep including lambs under one year old, ewes, rams and wethers, \$7,946,064.

Each dot represents 5,000,000 dozen eggs produced on farms in 1920. It will be seen that the heaviest production is in the corn belt states of the middle west.

Middle West Compared With East.

According to the 1920 census, production in the New England states—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut—decreased 29.5 per cent, while the corn belt states already referred to, increased 5.8 per cent in the production of eggs. While the figures given for the corn belt states show quite a difference among these states in the production of eggs, yet the size of these states vary to such an extent that the production in these corn belt states is about as great in one as it is in the other. The dotted map will bring out this fact more accurately than the statement of figures.

Eastern States Furnish Advantageous Market.

Experience has proven that the eastern cities furnish a better market for eggs not only for the corn belt states, but for those as far west as the Pacific Coast. A graph of Chicago and New York wholesale prices, by months since 1912, shows that New York has, without exception, always paid higher prices for eggs, the difference in price between Chicago and New York being sufficient to attract a considerable portion of the eggs to the east. The spread between the Chicago and New York prices is sufficient that it is even economical to ship from the corn belt states to New York City in as small as case lots by express. The individual shipments of this kind have netted producers all the way from three to sixteen cents per dozen over local prices due to shipping. These figures include white eggs for the higher figure and mixed colored eggs for the lower figure. (Continued on page 978)

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

Future Price Trend of Eggs

The Federal Department of Agriculture has recently issued a bulletin on the price of farm products in the United States, which shows marked similarity in the rise and fall of prices between three periods of our country's history; the war of 1812-14 when Europe was also engaged in the Napoleonic wars, the war of 1861-65, and the world war of 1914-1918.

In 1814, the level of wholesale prices in the United States reached 235 per cent and then declined.

In 1861, the wholesale price level stood at 93, and after four years of war, in 1865, it reached 200, and then declined to 93 in 1878.

In 1914, the wholesale price level stood at 102, and by 1920 it had reached 250. The only things in the world that had not increased in price were horses in the United States, coffee in Brazil and wheat in Australia.

By July, 1921, wholesale prices of manufactured products had declined to a level of 150, while the average price level of farm products stood close to 100. One of two things must now happen, either wholesale prices must drop lower, or farm products must go up. The dollar of the farmer and city man must be equalized; and the invisible empire of supply and demand, working as surely as the law of gravitation, will adjust the farmer's dollar to the manufacturer's dollar.

During this period of readjustment, each producer is interested primarily in his own commodity. If we may judge the future by the past, then history favors the poultryman.

In the early years of the recent world war, as during the civil war, the prices for eggs did not rise as soon as did the general price level.

After the civil war, relatively high prices continued to be paid for eggs. In January, 1874, which was 9 years after Appomattox, the wholesale price of eggs was 40 cents a dozen, which was 180 percent of the pre-war average. This was for the month of January, 1874. The price level of eggs for the entire year was 159, whereas

the average price level of all commodities for that year was 123 percent of the pre-war average. That meant that the poultry keeper's dollar had a high purchasing power.

The price of eggs did not get back to the prevailing average prices of all commodities until 1877, which was twelve years after the civil war closed. During all this period, everything that the poultry keeper bought was getting cheaper and cheaper. Other things were going down in price faster than the eggs which the poultry keeper sold.

So far a similar condition has existed in the egg market since the world war. In January, 1918, the price of fresh eggs was 170 percent of the pre-war basis. Two years later, January, 1920, the price level stood at 183. In January, 1921, the price level was 171.

Corn was already cheap. The price per bushel had fallen from \$1.77 in January, 1918, to 58 cents in April, 1921, which was 94 percent of the pre-war basis. Corn was, therefore, below normal. Corn reacted in the same way at the close of the civil war. It was worth \$1.87 a bushel in January, 1865, and in July of the same year, it was worth 74 cents.

Wheat did not react so quickly after the civil war. It was five years (1870), before it touched the pre-war price. Wheat is not reacting so quickly now. With Europe on short rations the export demand for wheat has made a world commodity of it, with world conditions setting its price.

History appears to be repeating itself, and the price levels of commodities are acting very much like they did after the civil war, as well as the war of 1812. If this similarity is maintained the poultry keeper will continue for some years to buy in a low market and sell in a high market, just as he did after the civil war.

No man knoweth what the future holds in store for him. He cannot see next year, or next week, or the closest thing in his life, the next hour. He can only go into the future with a knowledge of the past as his guide. In the case of the poultryman, history holds a promise for him.

To Help Standard Revision Committee

As is fully understood and appreciated by poultry breeders, the fowls on the farm of the United States Department of Agriculture at Beltsville, Md., are high-grade Standard stock, in which breed character and high production are combined. Harry M. Lamon, head of the poultry work of the Animal Husbandry Division of the Federal Department, is a judge and fancier, and knows breeds and breeding. His work demonstrates the practical value of the prevailing show-room ideals in thoroughbred fowls.

The question of ever maintaining those types in which the greatest usefulness and finest beauty may be combined, always comes to the forefront with each revision of the Standard. In the case of the present revision, which will soon be under way, the issue gives promise of being a lively one because of the aggressive interest being taken by commercial Leghorn egg farmers. A proposition to increase the weight of the Leghorn pullet has been made. The matter of length of feathering in relation to early maturity and high egg production is also being discussed, and the recommendation is heard that the lesser sickles of the Leghorn male should not hang below the main tail feathers. Again it is argued that a pure white ear lobe is associated with pale colored shanks, and a cream lobed bird is the more vigorous.

When points of this kind are brought before the Standard Revision Committee, it is well that the committee should be fortified with facts. In order to equip the committee with the best facts obtainable, President Thos. F. Rigg has requested the U. S. Government to send to the meeting of the Standard Committee in Indianapolis, a full exhibit of Leghorns from the Government Farm that have high records and combine good Standard quality. This the Government has agreed to do, sending the birds at Government expense. The correspondence between Mr. Rigg in behalf of the Standard Committee, and officers of the Government, follows:

AMERICAN POULTRY ASSOCIATION
FORT WAYNE, INDIANA.

September 15, 1921.

My dear Mr. Lamon:

The committee appointed to revise the Standard of Perfection and prepare the edition of 1923, will meet at Indianapolis, Indiana, during the month of May, 1922. As chairman of that meeting and president of the American Poultry Association, I request that you send to Indianapolis, an exhibit of White Leghorns from the poultry farm of the Department of Agriculture of our Federal Government.

In your breeding work on the Government Farm, you have ever held inviolate the precepts of the Standard of Perfection as formulated and written into Standard law. You have accepted these ideals and combined high egg production in high class Standard fowls. The birds that you have displayed at the Madison Square Garden Show have demonstrated the possibilities of breeding the highest utility in Standard White Leghorns.

I want the members of the Standard Revision Committee to have the privilege of inspecting, during this Indianapolis meeting, White Leghorn females that meet the requirements of the Standard and that have laid not less than 200 eggs each; also one or two cocks of good Standard quality that have daughters which have laid 200 or more eggs each; also cockerels that are typical Standard Leghorns that are bred from hens with 200 egg records.

It would be easy for you to pick such birds from the fine flocks on the Government Farm, and the birds, with their unquestionable official records and pedigrees, would be living testimony of the possibilities of the present Standard type.

I also request that you, Mr. Lamon, accompany these birds to Indianapolis, so that the members of the Standard Revision Committee may have the benefit of your personal attendance.

This is the first time, to my knowledge, that such a request has ever been made of any breeder in America. It is a tribute to your work as a breeder and a loyal member of the American Poultry Association.

I am sending a copy of this letter to the Honorable Henry C. Wallace, the Secretary of Agriculture, with the appeal that he approve this request to you.

AMERICAN POULTRY ASSOCIATION,

T. F. Rigg, President.

UNITED STATES DEPARTMENT OF AGRICULTURE
Washington, D. C.

September 24, 1921.

My dear Mr. Rigg:

On my return to Washington, I have your letter of September 15, and beg to advise that I appreciate very much your courtesy in asking that some of the high record Single Comb White Leghorn stock be shipped to Indianapolis during May, 1922, for the

inspection of the Standard Revision Committee of the American Poultry Association, which is to meet there at that time.

I shall be glad to attend the meeting and to render whatever assistance possible. Permission to accede to your request for the birds is being asked of the secretary today, and you will undoubtedly hear from him as to his decision in the matter within a short time. With best wishes, I remain,

Very truly yours,

HARRY M. LAMON,
Senior Poultryman.

DEPARTMENT OF AGRICULTURE
WASHINGTON

September 26, 1921.

Mr. Thos. F. Rigg, Pres.,
American Poultry Association,
Fort Wayne, Indiana.

Dear Sir:

Further in reply to your communication of September 15, I have to advise that we will be very glad to accede to your request that Mr. Harry M. Lamon, Senior Poultryman, of the Department, send some of the high record Single Comb White Leghorn stock from the Government Experiment Station, at Beltsville, Maryland, to Indianapolis, Indiana, in May, 1922, to be inspected by the members of the Standard Revision Committee of the American Poultry Association, which will be in session at that time.

Mr. Lamon will also attend the meeting and render any assistance in helping the committee to formulate its new Standard.

Very truly yours,

E. W. BALL,
Acting Secretary.

We are pleased to present in this issue several illustrations of the type of White Leghorns bred on the Government Farm. These birds are not only eggbred but are of modern Standard quality, and should effectively set at rest any doubts as to the possibilities of the beautiful exhibition Leghorn to meet all that utility demands.

What Mr. Lamon has done with White Leghorns, he has also done with Barred Plymouth Rocks, White Wyandottes and Rhode Island Reds. That it is not necessary to breed a tight feathered, high tailed, big combed White Wyandotte, such as Tom Barron of England sent to this country as "Utility Wyandottes," is amply demonstrated by the fine bodied birds on the Government Farm. In September, we did not see a White Wyandotte male on the plant but what promised to be worthy as an exhibition specimen, yet every one of those cockerels was dammed by a hen that had laid 200 or more eggs in a year.

The purebred poultry business has a big friend in Uncle Sam, and Tom Rigg has acted wisely in inviting the co-operation of Uncle Sam's hired man, who understands the viewpoint of the constructive fancier-breeder, and who is in possession of incontestable proof, in the form of living specimens, with official pedigrees and trap-nest records, and whose unimpeachable testimony should prove that all the leading fancier-breeders of America, for half a century, have not been wrong.

It is well that the existing ideals which prevail among Leghorn exhibitors and judges should be backed by such substantial support and unassailable evidence at a time when they are brought before the bar of public opinion for examination and proof; yet, this will not and should not prevent the Standard Committee, sitting as a court of judgment, from sifting down to the smallest detail, considering and weighing, any evidence purporting to show that Standard form is in any way inimical to greatest usefulness. The purebred fowl has always been, and must ever remain, a superior sort of fowl. Otherwise, there is no economic reason for its existence or the extension of its breeding.

A New and Helpful Attitude

In sending in the article which appears in this issue entitled, "The Poultryman and the Poultry Show," its author, Willard C. Thompson, professor of poultry husbandry at the New Jersey Agricultural Experiment Station, wrote:

"I have felt for a long time that I would like to express my views on the importance of our American poultry shows toward the development of the poultry industry, and therefore I have prepared the enclosed article for the November number of American. Trust it meets with favor at your hands. You know in our state here we have an enormous number of poultry raisers. I am trying to tell

them in every way I can that there isn't one of them that can afford to miss attending our great poultry shows here at their doors."

It is this progressive viewpoint of the younger men in agricultural college work to which we wish to draw attention. The future belongs to this younger generation which is already coming into prominence and being accorded positions of honor and responsibility. It is gratifying to note the respect in which one of these new leaders, Professor Thompson, holds the work of purebred breeders, and the enthusiasm with which he urges all poultry raisers to visit the poultry exhibitions, where the best efforts and finest achievements of the purebred breeders are on display. His appreciation of greatness in the work of others is in itself a sign of his own greatness.

It is this bigness of vision that is needed—and this spirit of co-operation. When the agricultural colleges first gave poultry husbandry a place in their work, and then branched out into staging egg competitions, it seemed that they were too critical and unappreciative of the fancier who had made the very breeds with which they were doing their work. No other branch of animal husbandry in our colleges ever withdrew itself as far from the aims and ideals of the breeders and evinced as little interest and sympathy in their work, their shows, their animals.

Those who read Professor Thompson's article in the Journal this month will observe his strong and favorable attitude toward the purebred breeder. It recalls the speech of Geo. M. Rommel at the Boston Show a year ago.

Mr. Rommel is a staunch friend of the purebred breeder, and as Chief of the Animal Husbandry Division of the U. S. Department of Agriculture, has stood back of and fully supported the breeding work of Harry Lamon. Mr. Rommel said: "Neither in merchant, journalist or utility poultryman, do we find the backbone, the really compelling driving force of the poultry industry. That, my friends, is found, just as in any other animal industry, in the purebred business. The men who make up the real strength of the breeding ranks, love their animals for their beauty as well as their economic value. They will spend hours watching them, studying them, learning their ways, catering to their wants. Who would go across the street to see an exhibition of birds not bred to a Standard? The very fact that such a Standard exists encourages system and thoroughness. It represents the consensus of opinion of the best breeders, and as such is a guide, which all breeders and farmers can safely follow."

Buff Orpingtons.

This is an interview with a breeder to obtain particulars respecting his opinions, gained through long experience, on the substantial and popular Buff Orpingtons. Perhaps a little introduction will serve to lead the way so that the reader will view the remarks as real, dependable information.

Therefore, to begin with, the father of the subject of this sketch was a breeder before him. His father was one of the leading producers of trot-

ting horses and Shorthorn cattle in Boone County, Indiana. He never sold horses at maximum prices because he never entered the racing "game." He bred and produced, but he never "played the game" for the high dollar.

His son became imbued with this spirit of the breeder. He has sought to be a producer of the highest types in Standardbred poultry. Others, if they wish, may call the purebred poultry business a "game;" he chooses to make of it a profession. His formula is, "successful men are but ordinary men with extraordinary determination;" and for twenty years his determination has been centered on studying his breed, the Orpington, interpreting breed tendencies, and endeavoring to make real merit in his breed and flock the basis of a permanent business success.

Orpingtons built every improvement on his farm, and they are telling evidence of the tangible assets of the breeding business as a profession. But, success did not come without effort, for he cautions: "In all legitimate lines of human endeavor, success is only attained in the degree to which a man applies himself."

He must apply himself to what?

The principal in this interview, C. S. Byers of Indiana, whom we here present to you, and whom you will be glad to hear discuss the breed he has studied so long, answers:

"He must apply himself to a study of his breed, its breed characteristics, the finer details that combine to make high Standard quality, and the handling of the birds so as to bring out all the

"REGAL SENSATION"

1st Madison Square Garden, 1919

REGALS STILL WINNING AT THE New York State Fair

At the largest and best of all the early shows, Martin's Regal White Wyandottes again prove their outstanding leadership by another record winning.

Cocks	1, 2, 3, 4, 5	Cockerels	1, 2, 3, 4
Hens	1, 2, 3, 5	Pullets	1, 2, 3, 4, 5
Pens (Old)	1, 2, 3	Pens (Young)	1, 2, 3

State Fair Commission, Gold Special for Best Display

This completes my sixteen years' record. In this long period I have won 82 Blue Ribbons out of a possible 94. This record, in addition to my wonderful winnings at Madison Square Garden, Boston, Kansas City, and other important shows, stamps the Regal Strain as the greatest winning line in America. As a heavy producing line they are just as famous and in the laying contests, record after record has been placed to their credit.

5000—Cocks, Hens, Cockerels and Pullets for Sale—5000

This season the Regals are better than ever and I am prepared to fill orders, large and small, with prompt dispatch. Send in a trial order and be convinced. As an all-round practical and profitable fowl, Regal-Dorcas White Wyandottes have no superior.

Pedigreed Cockerels (Exhibition or Dorcas)—\$10, \$15, \$20, \$25, and \$35.

Pullets and Hens (Pedigreed)—\$7.50, \$10, \$15, \$20, and \$25.

Breeding Pens—\$40, \$50, \$75, and \$100.

Utility Males—\$5.00 and \$8.00 each.

Utility Females from Heavy Laying Stock—\$4.00 and \$5.00 each.

SPECIAL OFFER—One \$8.00 Cockerel and five \$4.00 Females for \$25.00.

FREE—Send for 20-page Catalog and Fall Bulletin telling all about my present offerings. Send 10 cents for a copy of the Regal White Wyandotte Book. The information it contains will be of the greatest value to you.

JOHN S. MARTIN

Port Dover, Ont., Canada

good that is bred into them. His thought must be to raise the Standard of quality continually for the benefit of himself and those who look to him for foundation stock and new blood with which to reinforce their flocks."

Continuing, Mr. Byers says: "That means that the poultry business resolves itself into a breeding proposition and the poultryman must be a student, a thinker, and cultivate the quality of close observation which precedes critical and proper selection. A balanced judgment comes only with experience. The beginner at first may see only color and head points; with more experience he begins to understand the importance of breed type. By type I include the indispensable factors of size and substance. The Orpington is a big breed, and should be thought of as a bird of large proportions.

"In the matter of typical shape, the back section is a key to type merit. Some novices, as I have already suggested, will base their estimation of a bird largely on color of plumage and head points, whereas characteristic breed type is of paramount importance.

"Breadth of back is fundamental. More money has been paid for back shape than for any other quality in Orpingtons. Of course, the back might be good and the tail poor, but the breadth of back should be carried out and exemplified in the tail. The width must connect up with a corresponding broadness of tail.

"Feathering has an influence on the shape of back and tail. A well finished saddle carries broad individual feathers of good length. A hard feathered bird may have narrow, stringy feathers and consequently be narrow across saddle. Of course, regardless of the length of plumage, breadth of carcass at the hips must obtain to carry Standard back shape. In other words, a real Orpington must be a bird that gives true expression to massiveness, without superfluous feathering.

"A Buff Orpington that is cocked up on legs, usually lacks not only adequate body proportions, but length of plumage as well. The present propaganda against superfluous fluff was started through a Black Orpington breed characteristic, which resulted in excessive fluff plumage. It is not a breed characteristic of Buffs to be too fluffy; they naturally come with cleaner lines; but value must be placed on bone substance, correct body proportion and feathering, otherwise, through mediocre breeding, stock will run to too light bone, too high station, too narrow and deficient feathering, too long a neck and too high a tail.

"The breeder must bear in mind that the production of superior birds requires holding the indispensable qualities, such as I have mentioned, and breeding and reproducing them in each succeeding generation over a series of years. That is constructive line breeding, not hit or miss breeding.

"Corrective breeding is possible, regardless of the worth and merit of the birds. A man should secure as good stock as he can, but the favorable results that may be obtained from well balanced mating should not be overlooked. In Buff Orpingtons the tendency of some breeders is to balance their matings by breeding light birds to dark, to even up their color, but

S.C. White Leghorns

Hillview Strain stands supreme and are America's foremost line-bred Leghorns—A reputation won on quality.

Exhibition Birds and Layers

They have many years of glorious winning records back of them. This undefeated line of Champion Producers of every season, have always triumphed above them all in America's largest show rooms. The exhibition supremacy of Hillview Leghorns, has been decisively demonstrated by the winning of almost every ribbon for three consecutive years (1918, 1919 and 1920) at the Chicago-Coliseum Show, the greatest of all the White Leghorn Shows—a performance never approached by any other strain in existence today.

The official records will show that Hillview Strain has produced more exhibition hens with official records ranging from 200 up to 267 eggs in one year, than any other strain. In 1918, they have won 1st Prize Pen in the Missouri Egg Laying contest, and 1st yearling Hen Pen in the American Egg Laying contest. These performances have conclusively demonstrated that Hillview Leghorns as a combination of exhibition and laying quality, have no equal in America today, and that they will lay more eggs in one year, than the so-called Utility kind.

Results Among Our Customers

Are not only pleasing, but they are absolutely above expectation, both as winners in such large shows as St. Louis, Omaha, Hagerstown, Louisiana State Fair, Illinois State Fair, Chicago National, Kansas City, St. Paul, and many others too numerous to mention here, and as winners in Egg Laying Contests.

Guaranteed winners for any show in the country

When we make you this offer, we mean exactly what we say, we will furnish you winning birds for any show, regardless of competition. We have them by the hundreds, and can fill orders of any size and for any show.

Why you should breed Hillview Strain

Because we can furnish you birds that have years of constructive line breeding back of them, because we can furnish you birds mated in perfect blood lines that will assure you absolutely satisfactory breeding results, because we will assist you indefinitely in building up your flock—BECAUSE YOUR SUCCESS IS OUR SUCCESS.

Catalog and Bulletin No. 61—Free Upon Request—Write Today.

J. W. PARKS, Box J, ALTOONA, PA.

this mating should not be practiced.

"To improve a flock in type involves an entirely different system than to improve a flock in color. A mating to be well balanced must be uniform in color; but for a mating to be well balanced in type, the shape of the birds may be different. In other words, extremes in buff color cannot be mated together with the result of improvement in the progeny.

"Deficient type can be improved by corrective breeding. A cheap way to make this improvement is to buy a high-class male, which is equivalent to buying half a mating. It is important that the purchaser should recite to the seller the general defects in the individuals to which he desires to mate the purchased bird. In this way the seller is enabled to make intelligent selection for the desired improvement in the mating, provided, of course, that he has a large and superior line of stock to draw from.

"The average purchaser commonly writes that his birds are dark in tail and light in undercolor, overlooking the all important point of stating what shade of surface color he has in his birds; whether they be light, medium or dark. The color can be gradually toned up or down; but I would no more think of mating a hot colored bird to soft, even buff females than I would think of quitting the business. The correct shade of buff in both sexes is mated together in the very highest class matings, but in the process of improvement, this cannot be done; however, no opposite extremes of color should be tolerated in a mating, for a dark buff mated to a light buff results in mealiness and a spotted surface color devoid of strength and luster.

"Soft, level surface color with a corresponding wealth of undercolor, in all sections, are prerequisites for the production of dependable, true, Standard buff color. Such color adornment carried by a real Orpington in size, substance, massiveness and that capacity which closely fits our Standard, are rare, difficult to produce, and draw high monetary value, for in them lie the results and fruits of persistent, intelligent, constructive Orpington breeding."

We thank Mr. Byers for having reduced to words the ends he aims at and the methods he employs, thus enabling the printed page to put other breeders in contact with his work. It is always helpful when a breeder gives expression to his ideals, those models of excellence which ever go before him in his work, and then speaks of attaining that perfection by selecting and assembling into, one whole, the beauties and perfections that are usually seen in different individuals, excluding everything defective or, unseemly, so as to form type or model of the species.

White Eggs in New York.

As is pretty generally understood, the New York market pays a premium for white shelled eggs. This season, white eggs have been quoted at as much as 81 cents, and the very best grade of brown eggs at 58 cents.

The preference for white eggs in New York arose in the early days when cold storage eggs from the west

Aren't you tired of mixing feeds?

It's a back-breaking job, and without proper machinery it's next to impossible to mix ingredients as thoroughly as they should be. Then, too, there's the uncertainty of the ingredients themselves. Ordinary feeds as they come to market contain much trash and moisture.

Feed the Purina System

Purina Chicken Chowder and Purina Hen Chow, fed in equal parts by weight, supply a perfect balance of whites and yolks without the usual trouble, loss of time and guesswork. They make hens lay to the limit of their capacity. This perfect balance is far more important than the price of feed. Only one more egg per week will pay for all a hen eats. In Purina Chows only tested grains are used, double-cleaned and all excess moisture removed before sacking. This means economy!

More Eggs Guaranteed

Purina Poultry Chows, when fed as directed, are guaranteed to produce more eggs than any other feed—more eggs or money back. Supply both whites and yolks—feed for big egg production by feeding Purina. See your dealer or write.

An Actual Experience

KEOKUK POULTRY AND PET STOCK ASSOCIATION

KEOKUK, IOWA

"I have for the first time used your Carbola this year and my chicken houses are absolutely free of vermin although I have only sprayed twice this summer. I have had absolutely no trouble with mites on the roost, etc., since I used your preparation. This is not 'hot air' but an absolute fact, and hereafter Carbola is going to be my cure for vermin in my chicken houses."

October 8, 1921

Respectfully yours,

J. M. SKINNER, President.

were brown shelled, and fresh eggs from the Leghorn farms of New Jersey were white shelled. It came to be assumed that white shelled eggs were necessarily new laid eggs, produced in New York City's backyard yard, within one day's travel or less; whereas brown eggs were received from the more distant west, where the heavy egg flow came in the spring only, and where there was much less system in production and less standardization in getting the egg crop to market.

According to the New York "Globe" of Sept. 28, white eggs were being quoted at 26c more than brown eggs; and it was pointed out that such a difference does not seem to be warranted at this time; first, because the receipts of fresh eggs are heavier this fall than a year ago; and second because a brown egg is just as good a food commodity as a white egg.

Accepting these two principles as a base, and arguing from them, Alfred W. McCann, a writer for the New York Globe, has attacked the white egg.

Nevertheless this agitation against a premium for white shells is somewhat superficial. New Yorkers want and are willing to pay for a fresh, sound, sweet egg, produced on grain by hens that are kept under the most improved and sanitary conditions. The white shell is the emblem of such quality. The white-shelled Leghorn egg is the high-grade commercial egg of the New York market. It is the economical egg to produce, which, together with the fact that it tops the market, makes the business of producing it attractive.

A premium on the best grade eggs in the biggest and richest market in the world cannot be destroyed. If the effort to equalize the price of whites and browns were altogether sincere, the discussion would not be focused on the premium paid for white eggs, but would be along the educational line of pointing out the equal merit of a brown egg that was fresh, sound and sweet.

If it were possible to discourage the white egg producers, who are so splendidly organized for production, then it would follow that New Yorkers, in order to get the best fresh eggs, would pay a higher premium than was ever known, for they would have to bid on a limited supply, as there are not enough new laid brown eggs produced to supply the consuming center of New York in high-price months of October to January.

That the agitation in New York has not influenced the market is indicated by the following market report from the New York Commercial, Oct. 14:

EGGS—Receipts Thursday, 17,271 cases. The market is firmer on strictly fresh eggs, and prices show better averages than were secured earlier in the week. Collections in all parts of the country are falling off owing to the advanced season, and this condition naturally places the market entirely in sellers' favor. Quality is irregular in many well known packings, still there seems to be no shortage of extra firsts and firsts. The weather is cool, and encourages the free use of storage eggs, but trade in this class of stock has not as yet assumed much force. The demand for white eggs keeps pace with receipts. Some of the New Jerseys are really so fancy that the high prices asked are warranted. Coast shipments run fairly good, still many lots show shrunken stock.

**FOUR
INCUBATORS
IN ONE**

"Four In One" 800-Egg Section

With our "Four In One" you can take off a hatch every week. Raise broilers, the surest way of making money. Chicks, ducks, geese and turkeys all can be hatched simultaneously. Each lot of eggs has a separate egg chamber, which is entirely independent and fully equipped with its own thermometer, regulator, egg trays, nursery trays, etc.

All Prices Greatly Reduced

Our new prices are extremely low, yet the quality is the same as before. No better incubator was ever designed. We are using nothing but the best California Redwood, heavy galvanized steel and the solid construction of the machine combined with good workmanship make it last a life time. It is heavily packed and insulated to hold the heat.

ADDITIONAL SECTIONS may be added within a few minutes (even while the machine is in operation) up to 9600-egg capacity.

9600-Egg Machine (12 "Four In One" Sections)

SPECIAL MOISTURE GENERATOR for dry climates

We give the most far-reaching guarantee that any responsible firm is able to offer on their product.

Send for a copy of our catalogue and new price list and learn of the many other advantages of the Schwalge Incubator.

THE SCHWALGE-SMITH COMPANY

Elm St., Elmhurst, Ill.

It Takes Feed and Water to Produce a BIG EGG YIELD

Too many poultrymen think of feed alone, not realizing that water, which costs nothing, is equally as important as the costly grain. Laying hens must have water—a steady, clean supply at a comfortable temperature. Without it they cannot lay, and make losses instead of profits.

At the Missouri Poultry Experimental Station, it was proven by actual tests that fowls—any variety—fall off 50% in egg production when watered once a day as compared with those having water continuously. Think what it would mean to double the egg production of your flock with eggs at present prices! You can do this with less labor by using Norwich Automatic Air-Locking Fountains than by watering once a day.

Your birds will drink from four to ten times more water with the chill removed, and that means eggs! This wonderful Norwich Appliance provides a continuous supply of clean water with the chill removed at any temperature. It has been operated in Alaska at 60 degrees below zero! Safe—inexpensive to operate—positive in action—simple in construction—nothing to get out of order—a time, worry and labor saver.

Of course grain is necessary, and it's too valuable to waste or feed to mice, rats and sparrows. Put the scratch feed in Nor-

wich Automatic or Apaco Feeders and prevent all waste—save labor—reduce feed bills 25 per cent—exercise your birds—get more eggs. Careful tests show that Norwich-fed birds average 20 eggs per year more than those hand fed by experts. A test with your flock will prove this.

Poultry plants all over the country are being equipped with artificial lights to increase winter laying. The plan works. We know because we've been using it on a large scale for several years. This winter we shall have 4,000 Layers under lights. But take our advice:—equip your lighted pens with non-freezing fountains and automatic feeders. Without them the system does not work to full advantage.

You're interested, of course. Get the full story. Write us today and we will supply—free—full details of these wonderful machines which help you to make your hens lay and pay.

CURRENT NOTES AND COMMENT

Ready for Winter.

All young birds should be in winter quarters Nov. 1st. All thin, undeveloped cockerels and pullets should be eliminated, unless they can receive ample coop room and good feed. See that the house is clean and there is adequate ventilation. Crowding on old dirt floors, together with the feeding of rich feed, may cause trouble before winter is over.

Taxing Poultry Shows.

Harry Collier says that Thos. F. Rigg is going to be known in years to come as "one of the best, if not the best President that the American Poultry Association has had." It is already noticeable that Mr. Rigg is taking an active hand in the administration of his office. In the following communication from him, it is plain that his feet are on the ground, where the chickens are grown, and that he is determined to stand for a sound policy regardless of political expediency.

"I want to record my unqualified and hearty endorsement of your editorial, 'A Broad Policy,' in October issue. I am opposed to requiring or asking poultry shows held under the auspices of the American Poultry Association to pay a fee to the American Poultry Association for the recognition so given. I believe it to be unfair and unjust and not in accordance with good business policy. Again allow me to express my approval of your sound and splendid editorial."

Mr. Rigg has also sent the following announcement to the poultry press:

There seems to be a misunderstanding regarding the recommendation of the Committee of Forty that each show, held under the auspices of the A. P. A., must pay a fee of \$10 or more to the American Poultry Association. The fact is, that this recommendation of the Committee of Forty is not in force and effect, and that final action in this matter will be taken by the convention, which meets in Knoxville, Tenn., August next.

I am opposed to the A. P. A. taxing associations in accordance with the terms of the recommendation of the Committee of Forty. I do not believe it is fair or just, and hope to see the recommendation defeated at Knoxville.

Thos. F. Rigg.

A Show for All Breeders.

In addition to dealing with the important matter referred to by Mr. Rigg, and on which he so courageously and clearly expresses his opinion, the editorial to which he refers received its title, "A Broad Policy," from the liberal action of the Pittsburgh Poultry Show in guaranteeing the prize money on all varieties, even though there is only one bird in the class. Pursuant to this announcement of Pittsburgh's policy, W. G. Buisch, Secretary of the Rochester, N. Y., show association, wrote:

"We have never paid full first prize money where there was but one bird in the class, so do not know how it will work out. We noticed that Pittsburgh tried it last year and are going to do it again this year, and we have not yet come across the show that could do anything that we could not, so we are going to do it also, except we are not going to pay in all classes. We mean to have everyone understand that we are going to pay on the old, rare or odd varieties whatever they may be termed, such as Cochins, Games, Polish, Hamburgs, Dorkings, etc., etc."

"Your statement relative to commercialism is but a repetition of what one of our former secretaries wrote a long time ago was 'the matter with the poultry game.' We have heard so much from exhibitors that shows are what pork sausage is made of, that the exhibitor of Cochins cannot even get his express money back, etc., etc., that we decided to give them the chance and see if they were game or whether they were just talking. In addition to the regular prize money there will

READ THESE LETTERS

Gentlemen:

"The superior feeds put out by your firm, have and are today, one of the main factors of Hillview success.

1920 Hillview champions were raised exclusively with Basic Feeds Company Products, and this season we have nearly 5,000 youngsters developing into real champions with your fine grains and mash.

It is really a pleasure to transact business with your firm, for we have found you eminently on the square."

P. SCIARRA,
Hillview Farm, Benld, Ill.

Gentlemen:

Your last consignment of feed has arrived and I find it fully up to your usual quality.

I have bought \$50,000.00 worth of poultry feeds from various large concerns and I believe I am safe in the statement that your feeds, as you represent and deliver, are 30% better than the best feed sold by other companies at the same price. I am not interested in the reason for this difference, but I am deeply interested in the fact that it is true."

C. S. BYERS,
Hazelrigg, Ind.

Gentlemen:

I have felt for some time I ought to let you know that I have found your feeds, as far as I have used them, to be without exception, the finest feeds of their kind I have ever used in twelve or thirteen years at the poultry business."

F. L. BRACE,
Medina, N. Y.

Gentlemen:

On account of the success I have had in using your feeds for the last six months I cannot refrain from writing and telling you "never again any commercial feed for me." I find that my birds consume at least 20% less of this feed on account of its being all feed and no filler, and at the same time I get much better results both in growing my stock and in production from my layers than ever before."

E. D. TAYLOR, Prop.,
Kalamazoo, Mich.

Here's Proof

Buying Poultry Feeds Direct From Mill Saves Money for Poultry Raisers

For some time past we have been telling poultry raisers in our advertisements, the advantages of buying our 100% QUALITY FEEDS direct from our mill—we have told you why BASIC FEEDS being made from choicest feeding material, are better—we have told you how our plan of selling "direct from mill to user," thus saving the added expense and profits of middlemen, enables you to get better feeds for less money.

We don't ask you to take our word for it alone—we ask you now to read these letters from users of BASIC FEEDS—these letters prove conclusively the truth of every claim we make for

BASIC FEEDS

FOR POULTRY

right kind of feed you will be disappointed with results. Feed is more important than breed. It makes no difference how fine a flock you have, unless you provide them with the best the market affords—nothing added to make bulk—they are finely ground and correctly proportioned according to formulas that experiment stations and experienced poultrymen have proven to be the best that can be made. That's exactly what you get when you buy BASIC FEEDS—100% QUALITY through and through, and that is just the reason why successful poultrymen like those whose letters appear above use them in preference to all others.

Selling to you direct from our mill enables us to give you these better feeds for even less money than other feeds cost when bought in the retail way. Write today for free sample, descriptive folder and price list, telling all about the complete line of BASIC FEEDS.

When you get our folder and read it, your own good judgment will tell you that BASIC FEEDS will solve your feed problem once and for all—the free sample will enable you to see the superior quality and texture. Fill out and mail coupon NOW.

You are losing money if you raise poultry and do not use our MONEY-AND LABOR SAVING APPLIANCES

Our catalog presents a gold mine of information on such subjects as Portable Runways, Henneries, Brood Coops, Colony Coops, Setting Coops, Fences, etc. Also Trampnets, Exhibition Coops, Fattening Crates, Fireless Brooders. Our products are substantially made of galvanized iron, present an attractive appearance, are easily taken apart and packed for removal, and the prices at which we sell them make their purchase the most economical way of securing fixtures. Our Portable Henneries, with fence and other auxiliaries, presents an attractive and fitting appearance in any yard. Send Today for Catalog.

NIEMANN BROS. MFG. CO. Box 677 MT. OLIVE, ILLINOIS

be special cash prizes. When the try out is over and you care to know how we came out we will tell you and send you a catalog of the show if you ask us to."

We shall be glad indeed to receive a catalog showing the entries in the different classes at the forthcoming Rochester show so that we may know how the plan works out. We do not believe, however, that in a single year so far reaching a plan can be worked out with all its ultimate advantages.

For many years the heel of oppression has been felt by the faithful breeders of some of the grand old breeds. Not only have the classes been allowed to dwindle down through lack of prize money to help repay exhibitors the cost of showing, but poultry papers have tended to reduce their comment on all but the largest and most sensational classes.

It is as if conditions generally had conspired to repress the interest of a breed once its sun began to set.

The rising sun, as it looms upon the eastern horizon from Pittsburgh to Rochester, must again warm the ground, and the holders of the old seed stock must again plant and cultivate. It will take time to bring forth a full crop.

That the Pittsburgh and Rochester showing, in paying prize money on all breeds, will meet with practical difficulties goes without saying. It is no easy matter to give a coop, feed, water, a ribbon and \$2 in cash on a single entry of \$1 and then advertise to bring the public into the show to see the bird. Too many such classes will bankrupt any show association.

One way in which this difficulty is met in England is by allowing Gold and Silver Wyandottes to compete together as laced Wyandottes in a single class. All four colors of Cochins may also form another class.

* * *

Recognizing New Breeds.

Too many different varieties competing separately make it bad for a small association. Perhaps only one or two exhibitors enter in each variety. The result is that there are not enough full classes to make the show pay out should it guarantee first money in each class.

Where are we going on this question of new varieties? That is something that every breeder in this country should be thinking about. The time to think is now, before the next Standard is finally authorized.

In this issue of the Journal is an article on this subject by Fred W. Proctor, a man who has been actively engaged in poultry breeding since early in the seventies when the first Standard was published. He asks for a definition of policy on this important matter of breed recognition. He says that "in the consideration of breeds suitable for sanction and encouragement by the A. P. A." something basic and fundamental, something more than the "mere expediency of the hour, or the politics of a happy convention, should decide the issue."

There are about a hundred varieties in the Standard now. If you go in a cattle barn, you find three breeds of beef cattle, and three breeds of dairy cattle. In hogs you find four breeds of pork hogs and one of bacon hogs. Everything is centered on the few.

On the other hand, the visitor to a pigeon show finds that nearly every pigeon has a ribbon. There are so many breeds of pigeons that it has been said on good authority that no pigeon judge in this country knows the names of all the different varieties.

Poultry stands today on a middle ground. The time has come, as Mr. Proctor points out, to decide on the future course. The tendency in the past has been to encourage the development of new breeds. Multiplication has followed.

Recognition of a new variety carries a load of responsibility for every county fair and poultry show in this country that pays prize money on all Standard breeds. If recognition was associated with responsibility for the Association which votes to sanction a newcomer, the question of admitting new breeds would receive more careful thought and deliberate action. At the present time a new variety may be admitted and two thousand fair associations asked to pay prize money on its cocks, hens, cockerels and pullets, although

The Cream of 29 Years!

YES, here it is—our new book for 1922. Just received from our print shop and ready to mail to you. It is filled with the cream of 29 years of poultry raising. I call it a biography of poultry profits. There are other books that may tell you about different subjects related to poultry, but no book approaches this new 1922 Old Trusty catalog in telling you *about the dollars and cents profit side of poultry raising*. We think it is the best and most practical book ever published on this subject, and this is saying a good deal when you think of the fact that Johnson catalogs have been read by millions and millions of people and that over a million Old Trusty users now cover the country from coast to coast.

Let my 29 years experience help you make money this year.

Here are some of the questions you find answered in this book: How can I build a paying poultry business? What is the best size incubator to buy? Do I need a brooder? What kind of market is best? Do I need capital to start with? Can I make money on a town lot? How can I make an inexpensive poultry house? What are the best breeds? How can I get a start at raising poultry? Of course, these are just samples of the many subjects this big book touches on. In fact, it is a kind of guide for beginners and poultry raisers alike. It opens up the way to poultry profits for anybody who wants them.

Get My Reduced Price on Old Trusty

Yes, Old Trusty prices have come down. I am now giving you the biggest value in an incubator and brooder that I have ever been able to offer before. My new book will tell you about it. It will show you the improvements we have put into Old Trusty—the new improved moisture and ventilating parts; the improved egg tray slides and many other valuable features you can find only in Old Trusty.

Mail a postal card or write your name on the coupon, or write a letter as you prefer. Tell me your poultry troubles if any. We like to write letters but never hound people for an order. Our letters are helpful and full of Johnson experience in poultry raising. Send us your name so that we can write you once in a while, and in any event be sure to get this new 1922 catalog and my new reduced price on Old Trusty Incubators and Brooders. Next year is going to be a big, successful year for poultry raisers and now is the time to make your plans.

Send me your name and let's get acquainted. Yours for a big success in 1922.

\$2.25, \$2.75, \$3.25.

the A. P. A. does not consider the variety well enough established to justify an expenditure of \$100 for an idealized illustration of a Standard male and female.

We are opposed to the recognition of so-called new breeds that are not fundamentally new or better in essential particulars. A man could put a rose comb on the Silver Campine, or very easily breed a strain of this variety that had red eyes and white shanks, and the new strain might meet all the requirements of purity of breeding from an hereditary standpoint as laid down in the A. P. A. rules covering recognition of varieties, yet it would not be fundamentally new or better than the existing type of Silver Campines in essential particulars.

* * *

What the A. P. A. Should Do.

The article by Henry Turck, which appeared in the September issue, brought a number of letters to this office from people interested in the old Black Javas, while two breeders took the cue and made inquiry about foundation crosses for a new Rhode Island Black.

America does not stand in need of a R. I. Black.

A successful breed seems to give rise to new varieties which trade on the established breed name. This will continue to be the case until formal recognition of a new variety is elevated to the point where it becomes a talked-of event, because the new variety is not only unquestionably new and distinct but deserving of widespread interest and general approbation. Such a breed is the Lamona, not the Pyle Leghorn. How many of the latter have you seen since their admission to the Standard?

With a Standard of breeds, each distinct, each serving a purpose, and no two coming into close and acrimonious competition with one another, the big job of the A. P. A. should be to foster the extensive breeding of its Standard breeds. An easy and intelligent way to start this work is to be found in the contribution in this issue by Theo. Hewes entitled "Specialty Club Standards." Mr. Hewes writes on the matter of giving wider distribution to the Standard, and what he says will be read with more than merely passing interest, for it deals with a fundamental attitude of the American Poultry Association towards the wider expansion of Standard poultry breeding.

More and more is the feeling growing that the Standard ideals, as formulated by the breeders, should be promptly set before every man who buys a purebred bird. This new viewpoint is well set forth in the following letter from Fred W. Hallet:

"I feel that we are not only standing in our own light but keeping our light under a bushel as regards our American Standard of Perfection. All the cattle breeders' associations, hog breeders, and, in fact, even dog and cat associations offer their standards free to any one who only makes application as to the requirements of their breed; and we poor, weak-kneed mortals try to encourage people to breed Standard poultry and then hold them up to the point of paying \$2.50 or \$3.00 for an outline of the proper requirements of their breed.

"It occurs to me there are other ways of raising money besides the Standard. I know that the sale of Standards is a great source of revenue to the A. P. A. and all that, but why should we be the only organization of this kind to deny those interested free access to the printed requirements of the variety they wish to breed?"

* * *

Corn Borer Appears in Ohio.

The South has a 42 per cent cotton crop this year. The boll weevil is responsible. The corn crop, which is the corresponding big crop of the North, has been practically unmolested. But now comes word from the Ohio experiment station that the European corn borer has been found in every shore township from Cleveland east, and in seven scattered townships west.

As long as this menacing worm was confined to small areas of Massachusetts and

Hens that Produce Two Eggs a Day

are not impossible as my thirty years breeding WHITE PLYMOUTH ROCKS has proven. My customers have reported two eggs a day from their

U. R. FISHEL'S WHITE PLYMOUTH ROCKS

and they have proven their superiority as egg producers, as well as Prize winners and table fowls. You want the best, just like the hundreds of other people to whom we sell.

The best costs no more You get farm reared, vigorous, husky fowls selected by myself, so you will be pleased.

WHAT OTHERS SAY

.....Indiana
Mr. U. R. Fishel,
Hope, Ind.
Dear Mr. Fishel:

I write to tell you how proud I am of my flock and that pullet No. 20 laid an egg Sunday morning, 14th of August, at the age of 20 weeks and 2 days or a little over four months and a half. They were not forced. I was feeding them to hold them back, but the birds are developed, many of them weighing nearly 5 pounds. Number 29 weighed four pounds and four ounces.

If you have time I would appreciate a line from you telling me if this is anything exceptional.

I am your ardent follower and it is with pride and pleasure that I quote your name.

I remain,
Yours faithfully,
(Signed)
D. Robertson Smith.

.....Rhode Island
Mr. U. R. Fishel,
Hope, Ind.
Dear Mr. Fishel:

Just a line to let you know that the chicks I got from you the latter part of March of this year have commenced to lay. I got my first egg yesterday, Aug. 30th, and the pullet was about five months, nine days old. I

am well pleased with your stock.
Yours very truly,
(Signed)
Robert Lewis Weis

.....Ohio.
Mr. U. R. Fishel,
Hope, Ind.
Dear Sir:

The chickens arrived all O.K. at 5 o'clock yesterday in fine condition.

They certainly are splendid chickens and I thank you so much for selecting me such fine ones. I can't tell you how I appreciate them or how proud I am unless I give you all orders for what I may need in poultry in the future.

Again thanking you and wishing you the best of luck in all the shows this season, I remain,
Sincerely,
(Signed)

Mrs. R. W. Smart.

.....Illinois
Mr. U. R. Fishel,
Hope, Ind.
Dear Sir:

The chickens arrived the 14th, am well pleased with them and thank you very much for the selection.

Wishing you success, I remain,
Yours truly,
(Signed)

L. C. Riepe.

.....South Carolina
Mr. U. R. Fishel, Hope, Ind.
Dear Sir:

Received the cock bird yesterday afternoon in good shape.

I certainly am well pleased with him and want to thank you for such a fine bird. Have looked over a good many cock birds in this locality but find none to compare with him.

I will certainly give you first consideration on any future orders for stock, chicks or eggs.

Very truly yours,
(Signed)

J. Edw. Blatt.

.....Mississippi
Mr. U. R. Fishel, Hope, Ind.
Dear Sir:

Please send me your complete catalog of White Rocks, also prices. I bought a \$50 pen of your White Rocks about Dec. 1912 or Jan. 1913, when at Goodman, Miss. I have never seen finer or more healthy and vigorous fowls anywhere. One hen raised 21 out of 22 chicks, all grew to be extra nice, large and healthy and EXTRA GOOD LAYERS, but circumstances forced me to move to town and I had to sell them and now want more of that kind.

Yours very truly,
(Signed)

W. R. Tate

.....New Hampshire
Mr. U. R. Fishel,
Hope, Ind.
Dear Sir:

Just a line to let you know how the chicks you sold me last April came along.

I can but say that I am more than pleased with them and they are better than the ones I had last year. Some of the cockerels weigh seven and one-half pounds and are still growing. I did not lose one chick and I am sure your stock is as good as any I have ever seen.

The pullets began to lay September 1st, and I have only fed the growing mash and grain up to this day with plenty of sour milk to drink.

Hoping they will do as good this winter, I remain,
Yours truly,
(Signed)

Geo. A. Champney

.....Pennsylvania
Mr. U. R. Fishel,
Hope, Ind.
Dear Sir:

The five pullets and cockerels you shipped me arrived yesterday in fine shape. They are a fine lot and I am well pleased with them.

Yours respectfully,
(Signed)

G. W. Hartsock

Nabob Hatcheries - Gambier, Ohio

upper New York State, the corn grower of the West felt at ease.

Government agents were put to work fighting the borers with long torches that burned the ground, and the pest seemed to be under control. Then it got into Canada and prevailing southern winds blew the moths across Lake Erie into Northern Ohio. It is but one more jump to the corn belt.

W. P. Flint entomologist of the Illinois Experiment Station, after making an investigation in the East, stated: "There is no question but that we would grow corn after the corn borer is here just as the South is growing cotton after the invasion of the boll weevil neither would there be any question but that the insect would levy a direct tax on all corn produced in the corn belt, would increase the price to the consumer, and would increase the hazard of production to the farmer."

Just as the Southern cotton grower has been forced to diversified farming, since specializing in cotton is too hazardous, so infestation of the corn belt would oblige more men to take to small farms for a supply of food and clothing.

Agriculture is engaged in a constant war against insect pests. Some insects, like bees, are valuable, they make food and they pollinate plants. Some, like butterflies, are beautiful. Of others the life purpose is to destroy.

The coming of the corn borer would mean fewer beef cattle and hogs, which are large consumers of corn, and more sheep, milch cows and chickens, which are large consumers of what would be otherwise waste pasture and feeds.

At the present time, 40 per cent of our population are agricultural producers and 60 per cent are consumers. We have developed agriculture on the basis of greater production per man power, releasing a large proportion of our population for work in industry, art and science.

Anything that would diminish the productive power of men on the farm would result in higher prices for what was produced. More men would be forced to engage in production. It would mean a decline in the growth of cities, and more small farms. However, no one wishes for a reorganization of society and we hope that the corn borer will not materialize in the corn belt.

Death of Chas. Hubbard's Son.

We regret to learn of the death of the only son of Chas. H. Hubbard who is well known as manager of Robadel Farm, Cos Cob, Conn. Mr. Hubbard was completely wrapped up in his boy, as a fond parent should be, and the long illness and fatal termination was a heavy blow to him and the poultry fraternity will deeply sympathize with Mr. and Mrs. Hubbard in their sad bereavement.

Annual Club Meets.

We desire to call the attention of Specialty Club secretaries to the announcement of annual club meets which appear at the head of the poultry show date column. We are pleased to publish free of charge these announcements of annual club meets, together with names and addresses of the club secretaries. All secretaries are invited to furnish the date and place of the annual meetings of their respective clubs, for publication in the poultry show column of this Journal.

World's Poultry Congress.

Many interesting papers were read at the World's Poultry Congress, which was held at The Hague, Holland, September 5 to 14. Prof. Jas. E. Rice and Dr. B. F. Kaupp of the United States were in attendance. The Buckeye Incubator Company and The Quaker Oats Company, both of which are developing foreign trade, had exhibits. There were no birds from the United States, and "The Poultry World," London, in writing up the Congress, says: "America. Here we had our first and greatest disappointment. We had been told that America would send a good team of birds, but not one single fowl represented the great continent beyond the Atlantic. Speakers at the Congress, but not a feather to the exhibition. What will be the effect on the second World's Poultry Congress, which is to be held in America? We leave our American friends to supply the answer."

Let Certainty Replace Gamble

1920-1		1921-2	
Eggs	1240	Eggs	1249
Not Hatched	650	Hatched	1126
Died	320	Raised	1089
Loss	\$200	Profit	\$1503
Incubator - FAILURE		Incubator - BUCKEYE	

Poultry raising may be uniformly successful. Given proper equipment and attention, any person may earn big profits at the end of the season.

The profits depend upon two factors--the proportion of eggs hatched into healthy, vigorous chicks and the number of these chicks raised to maturity.

Where Profits Go

Every hatchable egg that fails to develop into a good chick, and every chick that dies is a direct cut into the profits. That is why you cannot afford to take chances on inferior or unproved equipment, and it is also why experienced poultrymen in all parts of the world use "Buckeye" Poultry Raising Equipment. This experience has proven to them that Buckeye Incubators hatch every hatchable egg, and Buckeye Brooders raise every raisable chick. There is no gamble, no large loss to eat up the profits. Ask the Buckeye User -- he knows.

A Million Depend Upon It

That million poultry raisers who depend upon Buckeye equipment do so because they have learned its reliability, its economy and its convenience. And Buckeye Incubators succeed because they combine the results of over thirty years' research and experience into the perfect incubator, automatic in regulation, simple in operation, free from frills, yet possessing every essential feature. The test of time endorses the teaching of experience, and both point to the Buckeye as the World's Best Incubator, from the little 65 egg size up to the largest mammoth, holding 10,368 eggs.

Assurance of Success

Buckeye Brooders are sold under a positive money-back guarantee of satisfaction because they, too, have proved themselves. They make three chicks grow to quick maturity where one grew before; they reduce the expense to half and the labor to a fourth, and they have the unqualified endorsement of authorities everywhere.

With such equipment the gamble comes out of chick raising. You have the **assurance** of success. The proof of these statements is contained in an illustrated descriptive catalog that is yours for the asking. Visit any of the 10,000 Buckeye dealers in all parts of the world or write directly to any of our offices for your copy.

Poultrymen who know rely on NEWTOWN BROODERS

"the Newtown raises the most chicks, the best chicks with least labor and at lowest cost."

The Newtown—the original colony brooder—made good from the start. Improved from year to year, it is better than ever—the one brooder that in practical use exceeds the maker's claims.

Plan now to raise the season's crop of chicks. The brooding equipment is most important. Decide upon and order Newtown Brooders now. Then you will have no regrets.

The time-tested, raises-the-chicks Newtown is made in two types—coal-burning and oil-burning. Each the best of its kind. Either one will delight you. Self-feeding, self-regulating, dependable, economical, wonderfully efficient. Ask for *free booklet*—and place your order early so you will be ready when that first hatch arrives.

We can deliver only a very few more Newtown Giant Incubators this season. If you want a real incubator better wire or write at once. Tell us what egg-capacity you need. Our prompt reply will give you all the interesting facts.

Book
Tells
How

We fear it will not be a pleasant one to themselves."

Spain introduced to the Congress what appears to be an entirely new race. It is called the Ear-ring fowl, and from illustrations published in the English press, the birds are rumpless (having no tail), the hens white in color, the cockerels show red on the shoulders, the comb is fine in size, shape and texture, and on each side of the face is a small protuberance which is connected to the head by a filament of elastic skin which allows it to be stretched a certain distance from the head. The Poultry World says: "These birds are quite new to Europe, having been discovered by Prof. Salvador Castello Carreras in Chili. They are distinct from Gallus Bankiva, Sonnerati, Fureatus, or Stanleyi. In addition to their quaint shape and appearance they lay blue eggs. It is proposed that they be named Gallus Inauris (Castello)."

Farm Egg Production and Egg Prices.

(Continued from page 961)

The saving by selling on the eastern market is even greater where the eggs are shipped under refrigeration and carlot rates secured. Then, too, eggs arrive at destination in better condition under refrigeration than by express.

Eggs are produced in sufficient quantity in these corn belt states that it is not difficult to collect a carload of eggs in a very short time in a given local community and send them east under refrigeration.

Most of the eggs shipped east are sold through some commission firm which usually charges a commission of 5 per cent, or a minimum of 40c a case, in less than carlots, and a ½c per dozen for carlots.

At the present time most of the eggs are marketed by the farmer to his local grocery man, or local cash buyer. It is customary for the grocery man to pay about 2c above the regular cash price when eggs are taken out in trade. The grocery man turns the surplus eggs over to the local cash buyer for cash. The price which the groceryman receives from the cash buyer is the same as his trade price to farmers.

If this local cash buyer is a carlot shipper, he either puts the eggs into storage or sells them through a commission firm to a wholesaler or to a jobber. The jobber sells them to the retailer or large user, who, in turn, sells them to the consumer.

If the case buyer is not a carlot shipper and is a subsidiary of a carlot shipping concern, his eggs are sent to his nearest carlot shipping point where the firm of which he is a subsidiary has a plant. The eggs are then stored or shipped as previously described.

Some small cash buyers co-operate by shipping together in carlots to eastern markets.

It is customary for cash buyers at country points to advise the grocers in the community what to pay for eggs, inasmuch as the cash buyers take the grocer's surplus eggs, and pay in cash the "trade price."

Spread in Prices.

During the past six months the average spread between the wholesale and retail price of fresh eggs in New York City has averaged 18.2c per dozen. The average spread during the same period between wholesale and retail prices in Chicago has been 10.5c per dozen. The spread between Chicago and New York average wholesale prices of eggs is least between January and March. The period over which the greater spread exists between the wholesale price of eggs in Chicago and New York is sometimes during October, November, and December, beginning sometimes as early as March.

The sharpest decline in the Chicago and New York wholesale price of fresh eggs over a period of years has begun during January or February and the decline has continued very rapidly without an exception on these two markets in the average monthly wholesale price of fresh eggs until about March of each year. It is during this period of rapidly declining prices when the spread between the wholesale price of eggs in Chicago and New York is the least. Also the price the consumer pays for eggs (retail price) at this exact period is nearer the wholesale price than at any other period of the year. The

LADY HOLLYWOOD II.

Laid 312 eggs—Nov. 5th to Oct. 31st. She was kept at the station until Nov. 4 and laid 315 eggs in 365 days. This is America's Highest Official Record.

THE GREATEST OF ALL LAYING STRAINS

BY OUR thousands of satisfied customers and our winnings year after year in official Egg Laying Contests we have proved absolutely that Hollywood has the GREATEST OF ALL LAYING STRAINS. This unequalled record has been made by us not with one or two winnings in dozens of trials, up one year and down the next, but by consistently winning, year after year, in all parts of the United States, from ocean to ocean.

MORE VALUABLE THAN THE WINNING PEN.

Auburn, Wash., Nov. 9, 1920.

Hollywood Farm:

Our pen at the First Western Washington Egg Laying Contest produced the highest value in eggs. We give all credit to "Hollywood" males. They not only sired our pen, but also sired 500 pullets that have averaged for us over 200 eggs each in the last twelve months, which was more valuable than the winning pen. Yours very truly,

Scott O. Holt.

SECOND PEN AND AMERICA'S HIGHEST OFFICIAL RECORD

Seattle, Wash., Nov. 6, 1920.

Hollywood Farm:

Gentlemen: I entered in the First Western Washington Contest, six pullets, hatched May 28th, from two settings of your eggs. They were hatched rather late and were not ready to lay when the contest started, but they finished second. No. 116, "Lady Hollywood Second," laid 312 eggs Nov. 5th to Oct. 31st. The management kept her until Nov. 4th and she laid 315 eggs in the 365 consecutive days, as officially attested. This beats Eglantine's record of 314 eggs made in the Delaware Con-

test and William's record of 311 made at Pullman, Wash. Will deliver pen to you today. Yours truly,

C. H. Burnett, Jr.

Seattle, Wash., Aug. 30, 1921.

Dear Mr. Atkinson, Hollywood Farm:

The pen I purchased from Hollywood and entered in the Second Western Washington Egg Laying Contest is leading the contest, but your pen is giving me a hard run. I also have the best individual, with a record of 265 eggs to date, or for the first ten months of the present contest.

Truly yours,

J. W. Merriman.

1920-21 WINNINGS—REPORT OF PROGRESS

At the end of nine months we are leading in the Bergen County, New Jersey, twenty-pullet contest; have best Leghorn pen at Storrs, Conn., in ten-pullet contest; have second Leghorn pen at Georgetown, Delaware, in five-pullet contest; have second pen at Puyallup, Wash., in five-pullet contest. No such record ever was made or approached BY ANY OTHER FARM.

BREEDING STOCK AND LAYERS FOR SALE

WE HAVE FOR SALE the finest lot of BREEDING COCKS, COCKERELS, HENS, PULLETS and MATED PENS ever offered to the American public. All of them are closely related to our contest winners. Circular and price list free to any address on request.

CLOSE-TO-NATURE COMPANY, 38 FRONT STREET, COLFAX, IA.

162 Ribbons 2 Silver Cups —

When a man writes me that he wants to win at his Local or State show, tells me how stiff the competition is going to be, and how much he feels like spending—I send him the kind of birds that'll turn the trick! Just as an example of what

SHEPPARD'S "Famous" ANCONAS

are doing for their owners, I am going to quote the letter of a customer from Iowa:

"Two years ago I bought some eggs and chicks from your 'Famous' Stock. Since that time I have won 162 Ribbons and two Silver Cups—thanks to you!"

If you've ever won a prize you know what a heap of satisfaction there is in standing before a coop of your birds at a Big Show—especially if there's a bright Blue Ribbon or a Silver Cup attached to it! I KNOW, because I've stood beside my speckled beauties at Madison Square Garden in New York and watched them win the High Awards year after year.

And the "Famous" Ancona egg-record is just as remarkable as their prize-record. One of them leads the field with 33½ eggs in 365 days; and a "Famous" flock holds the national record of 256 eggs in a year.

You'll be interested, too, in knowing that I can make immediate shipments of first-class stock at Right Prices.

Just drop me a line, and I'll send you my catalog. Or if you have a copy, order direct from it.

H. Cecil Sheppard

OWEN FARM'S WINNING S.C.R. REDS NEW YORK STATE FAIR SEPTEMBER 1921
VINEYARD HAVEN MASS.

price the producer receives not only runs very closely to, but during a short interval during this period often runs above the average wholesale price.

The sudden decline, characteristic of this particular time of the year, viz., about thirty days before fresh eggs begin to come on to the market in the spring months, has been explained in various ways. The most common explanation is that during the latter part of January or February, the dealers are making an effort to clean out on their storage holdings; and the forcing of these storage eggs on the market before the heavy flow of fresh eggs tends to depress the market before the fresh eggs appear.

A graph showing the amount of eggs put into storage, the amounts withdrawn from storage, and the total amounts in storage by months over a period of years indicates that the above explanation is not sufficient, for the total amount in storage, and the amount of eggs withdrawn immediately preceding, and during this sharp decline is practically nil.

Inspection of some confidential records and receiving some valuable explanation from one of the largest and most successful egg dealers of the country reveals that it is the anticipation of lower egg prices which reflects in trading and forces prices down, preceding the heavy egg flow.

It is interesting to note that the lowest average monthly wholesale price of fresh eggs in Chicago, beginning with 1913, gradually

arose each year from slightly below 20c in 1913 until June, 1920, when the lowest average wholesale price was only slightly below 40c per dozen.

In June, 1921, the lowest average monthly wholesale price of eggs in Chicago was only slightly over that for 1916. This brings the question to one's mind as to the possible outcome in the future for egg prices. The question which is often asked is: "Aren't there considerably more eggs in storage this year than ever before and won't this have an effect of lowering fresh egg prices?" If the storage problem has any effect on the general trend of minimum average monthly wholesale prices, one could conclude that the future is bright, for practically speaking, there are no more eggs in storage this year than usual.

It has been found that the spread between wholesale and retail prices at country points in the midwest varies considerably. It was found that some grocers were handling eggs on a margin of less than 5c a dozen, while others were taking a margin of 15c a dozen for the same service at the same time of the year. Some of these inequalities in prices, especially the latter, tend to make producers in the vicinity rather dissatisfied and has been one factor in stimulating individual shipments of eggs to eastern markets.

Another incentive to ship to New York City is the better prices paid for a standardized product which is not recognized at local country points. In other words, at the present

Brood Your Chicks 30 Days FREE!

**1,500 Chicks
around one stove**

Also small size stoves.
No hovers to bother
about. No gas, no
fumes, no wicks, no
smoke. All bother
and worry gone.
Losses reduced to a
minimum.

Use this wonderful new Simplex Brooder Stove in your own brooder house 30 days absolutely free. Write for free Brooder Book fully explaining offer. Try the stove under all conditions. Make any test you know of. Then, at the end of 30 days, if you are not delighted send it back and we'll cheerfully refund your money. You alone are the judge.

Turns Losses to Profits

This wonderful new brooder will raise 50 per cent more of your chicks than you have been able to raise by old-fashioned methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead

chicks into big profits for you. The Simplex soon pays for itself by extra money it makes. Saves Labor and Expense. The Simplex Brooder Stove means one-tenth as much work—costs one-fourth as much to operate as any other system. It is self-regulating—needs no watching—eliminates all worry. Try it 30 days free.

Send for Free Brooder Book

Send today for valuable book that tells how to "Increase your Profits by Decreasing Mortality"—absolutely free. It tells how to solve your brooding problems. It tells how to save the chicks that you have seen content to lose every year through disease and faulty brooding—how to make twice as much money from your poultry. Also catalogue and complete details of the wonderful Simplex Brooder Stove and our 30-day free trial offer. Sent to you absolutely free. Send today.

SMOKE-EM
CANNED SMOKE
REG. U.S. PAT. OFF.

THE GUARANTEE ROUP CURE was discovered on our breeding estate, where we breed registered Holstein Cattle, Spahr's Giant Epical Berkshire Hogs, and our world's famous NONESUCH, Ferris White 300-egg strain leghorns. After losing several thousand dollars' worth of our valuable birds, we were determined to discover a cure for Roup, Colds, Canker, Diphtheria, Chicken-Pox, etc. After discovering and using "SMOKE EM" (canned smoke) we have not lost a bird. WE POSITIVELY GUARANTEE "SMOKE EM" (canned smoke) to effect a complete cure or every cent of your money back. Read what Mr. Jos. W. Smith of Burbank, Calif. says: "I have tried 'SMOKE EM' (canned smoke) and I know it does the work." Mr. Chas. Brannan, Polo, Ill., R. No. 7, writes: "'SMOKE EM' is the best thing we have ever tried for Roup, Colds, Canker, etc. It is an absolute cure." Ex-Judge A. W. Ecker, of Woodsboro, Md., says: "I have used 'SMOKE EM' GUARANTEE ROUP CURE, and find it's very excellent remedy for Roup. I used several remedies but 'SMOKE EM' was the only one that produced an absolute cure." Thousands of unsolicited testimonials on file at our office.

Homestead Silver Campines

The vigorous strain—dominate in the world of Campines. The wonderful BELGIAN fowl—noted for their heavy egg production—"THE EVERYDAY LAYER" unequalled as BROILERS. These birds are not alone FAMOUS for their UTILITY, but are BEAUTIFUL and MOST interesting. Some wonderful breeding stock for sale directly after the breeding season closes but now is the time to book your order that you may not be disappointed.

Eggs Half Price Balance of Season.
HOMESTEAD CAMPINE FARM, Box A, WAYLAND, MASS.

time a farmer who produces high class eggs doesn't get any more for his product at the country point than one who produces eggs of somewhat inferior quality.

Cold Storage Eggs.

In glancing at a graph showing the amount of eggs in storage by months over a period of years, in Chicago for example, it will be found that the total amount of eggs put into storage does not vary much from year to year, excepting that during 1919 there were considerably more eggs in storage than usual.

Eggs are not taken out of storage at the time of year the general public suspects. Some eggs are taken out of storage usually beginning with June, then usually beginning with the month of August the amount taken out of storage increases very rapidly until October or November, when a greater amount is removed from storage over a period of time than at any other time during the year. The movement of eggs out of storage begins to decline very rapidly after this period.

Eggs are put into storage in the middle west, of course, when the production is greatest and price cheapest, which usually begins with March, increases rapidly, and is at its height during April, and begins to subside usually during May. These months may vary slightly, depending on seasonal weather. Eggs started into storage quite rapidly during February, 1921, which was earlier than usual because the season was warm and advanced.

The storing of eggs is a legitimate part of the industry and a blessing to consumers. Eggs are stored during the early spring months not only because of cheaper price and great production, but at this time of the year the eggs are much firmer and make a better product for storing than they would later on when the whites are watery.

Co-operative Egg Marketing.

Many states are now participating in the co-operative marketing of eggs, some to a large extent, while others are working on a local co-operative basis. New Jersey has been recently organized under the name of New Jersey Poultry Association to market eggs co-operatively.

Iowa is also marketing eggs co-operatively. At New Providence, Iowa, eggs are shipped co-operatively to eastern markets and the co-operative organization is worth 10c a dozen in actual cash for every dozen eggs marketed from June 1 to March 1, although through the spring months the price is not much higher than the common run of eggs.

Farmers in Missouri are also marketing eggs co-operatively through their produce exchanges.

Ohio is starting to form co-operative egg circles, but they have not been in operation long enough to secure any definite information as to their success or failure.

Through the Nebraska Farm Bureau the Hamilton County, Nebraska, Shipping Association is marketing eggs co-operatively. When this local association started its receipts amounted to 2 cases the first week, 9 cases the second week, and at the last reports were running 65 cases per week for the local association.

Oregon is marketing eggs co-operatively on a large scale and is a successful state-wide marketing association.

The poultry producers of central California, in the district of Petaluma, have the largest and most successful egg marketing association in the world. They receive, pack and prepare for shipment their eggs to eastern markets at a cost of about 1c a dozen.

Washington state is also marketing eggs co-operatively and has some 16,000 egg and poultry members who market on an average of 9 cars of eggs a week. This association has a capital stock of \$250,000 and a paid-up capital of over \$50,000. During the past 12 months this co-operative association did a gross business of \$1,500,000 and shipped 75 per cent of their out-of-state shipments to eastern markets. This association puts up several cars of eggs each spring into storage and disposes of them at a profitable price.

The following word has come from the farmers' organization of Texas, concerning some of their poultry problems in Texas:

"The Texas Farm Bureau Federation recently sent out a questionnaire to ascertain the exact condition of the poultry industry.

Put Yourself In This Man's Place

"What Made Jim Taylor Late For Supper?"

Mrs. Taylor was worried, for Jim was seldom late for supper. Finally she heard footsteps outside and Jim opened the door.

"I couldn't help it, Polly—just couldn't help it," said Jim, as he put the bank book on the table, "we are going to have our new poultry house this winter. I have just paid off the mortgage on the place, and bought the lumber for the new building, and see," as he took up the bank book, "we still have \$2,100 in the bank."

"Just think, Jim," said Mrs. Taylor, "the chickens, and The National Poultry Institute did it all."

"You are right, Polly. It was a lucky day for us when I sent for their free book 'How to Raise Poultry for Profit.' I am going to put up the new poultry house according to their suggestions."

"It doesn't seem possible, does it, Jim," said Mrs. Taylor, "that two years ago you were working for some one else, and today we own our own home and poultry plant; we are able to put up a new poultry house, and have a good bank account besides. It beats working for the other fellow."

NOW IS THE TIME, FOR YOU. THE BIG SEASON IS HERE. Put yourself in Jim Taylor's place. A new edition of the book "How to Raise Poultry for Profit" has just been issued; send for your copy today; it's free. This remarkable book contains many valuable suggestions on poultry raising, and may prove the stepping stone to your future success. Act quick. Send today. A postal will do.

The National Poultry Institute, Inc.
Dept. 111 WASHINGTON, D. C.

The replies show that there is a wide variation in prices being paid for poultry and eggs in the state. Turkeys vary in price from 12c to 21c a pound, and fryers from 12c to 18c per pound. Prices paid for eggs vary from 12½c to 30c a dozen, and for hens from 10c to 17c per pound. This shows that in some localities at least the producers are not getting what they should for their product.

"The Texas Farm Bureau Federation advised forming local pools, where the products were sufficient to ship in carlots. The saving should be from 3c to 10c a pound on poultry and from 5c to 10c a dozen on eggs. A charge of 1c a pound should cover the expense of handling poultry. The expense of handling eggs would be slightly more, because they should be candled. The cases for eggs would, of course, be an added expense."

During the war a farmer in Illinois reported to the state extension poultryman that his local commission buyer was paying at that time (July) 25c for eggs, whereas a commission buyer 17 miles distant in the same county was paying 35c a dozen. The state extension man brought this disparity in prices to the attention of the food administrator of the county, with the result that the following week the 25c buyer was paying 30c.

A farmer of today is of a different type than the one of yesterday. The trains, automobiles, daily rural delivery of press reports, organizations, and conventions, not only of his own, but of other less-important industries, have all been factors in transforming him from a mere Trojan of the soil to the farmer of today. He is now interested in the business of farming, with increasing ability to correlate not only his daily affairs with that of his neighbors in other States, but even with other industries, and he has begun to judge the effect of the relation of these other activities to that of his own business.

In this new day of changes, however, we must not try to fly before we learn to walk. Efficiency, products of economic evolution, and time-honored institutions must not be ignored.

Feeding Sour Milk.

I read an article in your journal this spring on feeding milk to baby chicks. The author of said article stated that the first thing he fed his chicks was milk. He took each chick and dropped milk onto its palate so that it would thus acquire a liking for it. Then he placed milk before the chicks, without water, to insure its consumption.

The gentleman who wrote the piece reminds me of the mother who gave her newborn babe castor oil the first thing so that it would acquire a liking for it, thereby making future doses a pleasure.

Baby chicks like milk, and those that have both milk and water before them from the first will consume just as much milk as those that are forced to drink it for a few days or choke.
Ariz. Geo. G. Haws.

Molting Fowls on a Town Lot.

There is never a more severe strain upon poultry than during the molting period. That is why fowls while molting should have the best of care. Unless fowls receive the best attention during the molt, good results in winter egg-production cannot be expected. Good exhibition fowls are often ruined from lack of attention during the molt.

In giving fowls proper care, first in importance is feeding. Increase the amount of protein in the feed by adding more oil meal and beef scraps, so that there is one part of protein to three parts of carbohydrates and fats combined. Make the fowls consume more mash even if it is necessary to cut down the supply of grain feed. A moistened mash fed at noon will be helpful and greatly relished by the fowls. A little sunflower seed fed daily will aid greatly in growing the new coat of feathers.

Caution should be taken by breeders of white feathered fowls not to feed too heavily on greens or yellow corn, as they may cause creaminess to appear in the feathers. Make the fowls scratch for their grain feed in a deep litter, as the exercise will help loosen the feathers. Keep plenty of grit, oyster shell, charcoal and cool water before the fowls as usual.

Next in importance is to see that the fowls have shade of some sort. Natural shade furnished by low bushes is the best, but trees or sunflowers are good. If no natural shade can be supplied, then shelters

Artificial Light in the Poultry House

has increased the egg production of some flocks as much as

100%

GEORGE NEWELL discovered that by the use of artificial light in his laying pens during the early morning and evening of short days, he doubled his egg yield. He put the results and methods of his experiences into a book called

A Revolution in Egg Production

This book is not a collection of clippings and theories like so many poultry books, but contains the results of common-sense ideas which have been put to test and found practical. They do just what they say they will do—**increase the average egg yield 100%.**

It is profusely illustrated and contains chapters on Care and Feed in General—Balancing the Ration—Conditions Should Be Watched and Noted—What to Feed—Underfeeding—Overfeeding—Automatic Feeders—Fussing vs. Economy of Time—Water Problems—Housing, Ventilation and Light—Trap Nesting—Incubators or Hens for Hatching—Brooding Problems—What Breed?—Meat Production a By-Product—Yards and Exercise—Spring and Summer Eggs—Fall and Winter Eggs—Care of Eggs—Ask the Birds; Their Judgment Is Good—Production Under Present Conditions—Production Records.

Cloth bound, 112 pages, handsomely illustrated, postpaid, price \$1.00

American Poultry Journal Pub. Co., 523 Plymouth Ct., Chicago, Ill.

Get More Eggs —Save Feed!

New FREE BOOK Outlines Simple Methods That Never Fail

ANYBODY interested in having best success with poultry—bigger egg yields in November and December and all through the winter—will want a copy of this new book, "Dollars and Sense in the Poultry Business." T. E. Quisenberry, one of America's most successful poultrymen, is the author of this book. Filled with ideas and outlined methods that never fail. Thousands and thousands say it turns failure into success and empty pockets into bank accounts.

These Methods Have Brought Great Success To Over 35,000

This book outlines easy methods that show you how to be sure of big egg production, regardless of weather conditions. It gives the secrets that have given Prof. Quisenberry his world-wide reputation and which have brought fame to many others. A few of the subjects outlined are shown opposite. There are many others equally valuable.

96 Pages of Money-Making Information; Make Every Hen Pay Big!

Charles Kittinger, a building contractor of California writes: "My net earnings from 55 hens were \$647.00, an average of \$11.77 per hen after following your methods." Mrs. Anna Lovely of Connecticut was down to her last dollar. "I am now getting eggs from 175 hens to pay all household bills, besides plenty of eggs for hatching and raising young stock." Remember, you can do as well, if you follow these practical methods.

DR. HESS POULTRY PAN-A-CE-A

Universally endorsed—Universally used:—by the big 10,000 hen plants—by the average farmer with his 200 hens—by the back-yarder with only a dozen hens to consume the table scraps. Pan-a-ce-a tones up the dormant egg organs, so that the proper amount of a hen's food goes to egg-making—and not all to fat, flesh and laziness. A Pan-a-ce-a hen is always a hungry hen, an industrious hen. You can depend upon it, the healthy, hungry, scratching, singing hen is the laying hen, the paying hen.

Always buy Pan-a-ce-a according to the size of your flock. Your dealer has a package to suit. Good results guaranteed.

Packages from 25c to the 100 lb. drum, \$10.00.
Except in the far West and Canada.

DR. HESS & CLARK
Ashland, Ohio

can be made from boards or awnings. Many a good show bird has been ruined by being forced to run about in the hot sun.

While the fowls are molting be on constant guard against disease, as it is likely to spread rapidly, once it is started, because of the weakened condition of the fowls. Wash the fountains daily and use a good disinfectant in the house twice a month. Keep up a continual fight against lice and mites. If these simple rules are followed a quick and satisfactory molt can be expected.
James M. Potter,
Texas.

What About R. I. Whites?

By Theo. Hewes.

The breeders of Rhode Island Whites have asked for admission to the Standard of both Rose and Single Comb R. I. Whites. They have complied with the requirements of our constitution. What are we going to do with them? This matter must be settled at the next revision of the Standard and it is up to the members of the Revision Committee to decide this important question.

I have personally taken the matter up with prominent breeders of Rhode Island Whites and have asked them if they would be satisfied with the admission of Rose Comb variety only, but I find there are as many breeders of the Single Comb as there are of the Rose Comb, and that to admit one variety and not the other would be an injustice.

There are hundreds of breeders in this country, many of them members of the American Poultry Association that are financially interested in this breed; they believe in it as a commercial fowl, and their likes and dislikes should have the same consideration by the Revision Committee as that of any other specialty club. In the single comb variety of Rhode Island Whites we have a type of bird very similar to the White Plymouth Rocks and it might be that birds of one variety might be shown in the other class and prizes awarded to the wrong breed; however, the weight of the two breeds is different and if a Standard description can be so worded and the type of the two breeds be kept separate, then there is no good reason for them being denied the same right as other Standard fowls.

We have some members that seem to think we have too many breeds in our Standard now, but this class are hopelessly in the minority. Every good breed should be recognized and every good breed should be given consideration by the Revision Committee, and when the breeders of that breed or variety comply with all the requirements of our constitution and show us that the breed they are interested in is bred in sufficient numbers, and is so widely distributed that no one could have a corner on them, then they should be admitted.

I have never been 49 percent for and 50 percent against any proposition. I am either for a thing or I am against it and the breeders of Rhode Island Whites have too much money invested in this fowl for the American Poultry Association to pass them over lightly, and as one member of the Revision Committee, if I find they have complied with all the requirements of our constitution, I shall vote for their admission.

Let us hear from the other fellows. We have accepted the position and it is up to us to declare ourselves.

Two Brown Leghorn Varieties.

"Am just taking a minute to write to you, Old Big Chief Hard-Sense, and compliment you on your editorials in the American Poultry Journal. That one on the two varieties of Brown Leghorns is 'Pat' and right to the point. You say they are two distinct varieties. I'll go you one better and state and prove that they are two distinct breeds as well as two distinct varieties.

"All pure-bred stippled breeds take their name from the color of the female, and males of stippled breeds invariably have no striping in hackle or saddle. Go back to Gallus Bankiva; follow up to Black Breasted Red Exhibition Games, and the female line of the old Brown Leghorns, and the law holds good.

"All pure-bred penciled breeds are named from the color and markings of the female, and males of penciled breeds invariably have a black stripe in hackle and saddle. See Partridge Cochins, Partridge Rocks, and Partridge Wyandottes.

"Away back in history we find Partridge fowls in China said to be with lines 1500 years back; and males are portrayed with stripes in hackle and saddle. The Ceylon jungle fowl was of a penciled type, said to be one of the progenitors of Partridge Cochins and Dark Brahmas. We can also trace this penciled idea in the Dark Brahmas with kindred plumage." W. H. Card.

It's A Winner!

My New Super Sol-Hot Heater Creates Sensation Among Poultry Raisers

My big double page advertisement last month announcing my New Super Sol-Hot Heaters for Incubators and Brooders certainly did make a big hit. Letters came pouring in from poultry raisers all over the country asking for my free catalog folder giving detailed particulars of my new heater. Such expressions as "just what I've been waiting for"—"I think you have just what I want"—"you've solved a problem for me" in letters I received, prove conclusively that the New Super Sol-Hot meets with the universal approval of poultry raisers — it marks the dawn of a new era for poultrymen.

Made in 5 sizes suitable for Small Brooders and Incubators from 60 egg and chick sizes to 3000 egg and chick outfits.

Automatic Oil Control!

The New Super Sol-Hot oil control is positively automatic — no trouble of any kind — Sol-Hot burns evenly all the time—you simply light the burner, that's all—no hand adjustments—the burner won't go out—won't overflow, won't smoke—the action of the automatic oil control is positively infallible. My new patented oil control entirely eliminates the element of human control.

All Metal Vaporizer

The All Metal Vaporizer, shown at the left—also a patented feature, is regular equipment of the New Super Sol-Hot. This patented device takes the place of the old fashioned asbestos ring vaporizers with their trouble and annoyance. The All Metal Vaporizer does not carbonize, smoke or give off fumes. Asbestos ring vaporizers can be used on the Sol-Hot but we do not recommend them.

Sol-Hot Canopy Brooders

Sol-Hot Canopy Brooders heated with the New Super Sol-Hot Heater makes the ideal combination for the successful rearing of chicks. Safe and dependable—uniform heat all the time—you can depend on it day or night—no danger of heater going out—no danger of chicks being smothered with gas fumes and smoke. Sol-Hot Canopies are furnished in three sizes—32, 42 and 52 inches in diameter. We also make the Baby Sol-Hot with 22-inch canopy to meet requirements of the back lotter with small broods.

Illustration showing Sol-Hot Heaters for Incubators

Write For Free Catalog Folder

We haven't space in this advertisement to tell you all about Sol-Hot Heaters and Canopy Brooders—our new illustrated catalog folder tells all about them—how and why they are better—explains all about the new automatic oil control—how it operates, etc. This catalog folder will be sent free on request.

Don't buy equipment of any kind until you learn about the better Sol-Hot. We urge dealers and agents to arrange now for their allotment of heaters and brooders—this is going to be a Sol-Hot year.

SOL-HOT Canopy Brooder

GREEN SHEEN STRAIN

Silver Campines

Elegant young stock, well grown, now ready for sale at fair prices. A wonderful selection of cockerels, pullets, cocks and hens at your command. I am especially prepared to furnish exhibition birds that will win for you and prove to be sound breeders. My birds are single mated and exhibition birds are mated together. No trick back of these birds.

Campines are fast growers, plump at all ages, heavy layers of large, white shelled eggs and eat less food than Leghorns.

I have the largest plant devoted to the raising of exhibition and high egg-record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 62 males placed under ribbons at the Coliseum Show in last nine years. During the same period, I have had 147 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

Write me for information. Your absolute satisfaction is guaranteed.

MY HEALTH WAS
FINE AND I LAID
200 EGGS
IN ONE YEAR.

GUARANTEE DOUBLE HEALTH AND EGG PRODUCER was discovered on one of the largest breeding estates in the world. Is fed regularly to our world's famous BONESUCH FERRIS WHITE 300-egg strain Leghorns. 750 layers fed GUARANTEE DOUBLE HEALTH AND EGG PRODUCER averaged 215 eggs per hen last year. This was accomplished by feeding thoroughbred stock GUARANTEE DOUBLE HEALTH AND EGG PRODUCER, regularly. Hens must be kept in the best of health to be profitable layers. Sick hens WILL NOT LAY. During fall and winter the weather is changeable and chickens are subject to colds which bring on the deadly roup. First symptom being poor appetite and the hens refusing to lay. KEEP YOUR CHICKENS IN PERFECT HEALTH, by feeding a teaspoonful to fifty hens of GUARANTEE DOUBLE HEALTH AND EGG PRODUCER, which is an honest medicine without a filler. Must double your egg production or your money back. Send us \$1.50 for two regular \$1.50 cans. \$3.00 value for \$1.50. Special introductory offer made for a limited time only.

MANKATO, MINN.

Causes that Help to Make Culls.

(Continued from page 958)

table, while in many other cases where commercial meat scrap or tankage is fed, the flock owners are careless about seeing that the supply is kept continuously available.

Probably 75 per cent of the mash hoppers used do not feed properly, and unless the poultry keeper pays constant attention to them the mash supply becomes clogged so that the chicks are deprived of it for a considerable part of the time. Another very common occurrence is for the flock owner to run short of animal protein and, on account of the laxness of feed dealers in keeping their stock up to date, the flock owner frequently is unable to secure a new supply short of two or three weeks after the available quantity has been used.

Some flock owners do not include the proper proportion of meat scrap or tankage in the ration under the false impression that liberal quantities of animal protein will cause digestive disturbances, possibly diarrhea, in the chicks. The feeder of one flock used only 5 pounds of commercial meat scrap to each 100 pounds of mash, and his chicks showed an unusual number of poorly developed, crow-headed specimens. One objection to many of the commercial mashes is that they are low in the per cent of animal protein and use vegetable protein, such as cottonseed meal or linseed meal, to bring up their protein analysis, with the result that the chicks are not furnished the proper kinds of protein nutrients.

Another mistake made in many flocks is to use a mash that contains too high a per cent of crude fibre. On one farm 25 pounds of alfalfa meal and 20 pounds of ground oats were being included in each 100 pounds of mash. This contained so much crude fibre that the chicks could not possibly eat enough to furnish the proper elements needed for growth.

Perhaps the most cardinal sin in feeding and the one which causes the largest proportion of culls is the tendency to be too economical with the ration and to under-feed. In one case where a back lot poultry keeper had bought pullets from a farm flock, the farm hens showed 40 per cent culls in the fall of the year, due largely to the fact that a majority of the hens were too thin to lay, while out of ten pullets from the same stock kept under back lot conditions and given all the feed they would eat, only one out of the ten showed any cull characteristics at the end of the first laying season.

With proper attention to the selection of breeding stock so that the noticeably weak individuals are not used and with the chicks hatched during the most favorable months which, on a line from Missouri to Long Island, are March and April, chicks that are brooded under circumstances that insure the proper degree of heat, with free range given to insure exercise, and liberal quantities of green feed, and the feeding of unlimited quantities of a ration rich in animal protein, will insure against more than a small per cent of culls. In some flocks where conditions are favorable less than 10 per cent of the stock raised shows any cull characteristics, while under less favorable conditions 50 per cent of culls is common.

*The Mark of
Quality*

PULLETS

3000 of them

Oak Dale Pullets are the progeny of all the famous winners at Madison Square and Boston during the past twenty years. The Oak Dale Strain of White Leghorns has been restricted to only the choicest individuals, thus assuring you that the pullets purchased are the best that can be had.

A MONEY MAKER FOR POULTRYMEN

The "EVERGREEN" Oat Sprouter

—the sprouter
that's different

At Last!

The Perfect Oat Sprouter

After many years experimenting to produce an oat sprouter that would produce the greatest amount of tender green oat sprouts in the shortest time with less trouble and without any waste or spoilage, we have at last succeeded. This new improved EVERGREEN OAT SPROUTER is in a class by itself. Whether you are a "back-lotter" with only a few birds or if you are raising poultry on a large scale you need an EVERGREEN OAT SPROUTER—it spells SUCCESS to every poultry raiser—it cuts down feed costs—it

Converts One Bu. Oats into more than Three Bu. Green Feed

The secret of the success of the EVERGREEN is in its two heat chambers—its interior arrangement—its heating system and its convenience. We discovered that different degrees of heat were necessary during varying stages of germination and growth of oat sprouts to get best results—the EVERGREEN supplies the different temperatures during the various stages—that's why it produces more green feed with less grain and without spoilage.

Our "Seven Tray" machine supplies you with a never ending supply of an abundance of tender green sprouts, enough for your flock of hens every day. Each day put in a tray of raw oats, at top of machine and take out tray of tender sprouts at bottom—it's a revelation—nothing like it ever before offered.

Write for FREE Folder "Solving the Question of Winter Egg Production."

Write today for descriptive catalog folder and price list, telling all about this wonderful machine—how it will enable you to double and treble your poultry profits. Don't buy an oat sprouter of any description until you find out about the better, more convenient "EVERGREEN."

Philosophy of a Fancier-Breeder.

(Continued from page 960)

can only please customers who entertain the same erroneous standard of values. Again, the novice may contract the heavy egg production hobby and buy into a flock with a home-grown flock record of 286 eggs per hen (?), but this hobby weakens when the prospective customer views and criticizes his slab sided small, ill-shaped, system drained flock that is perceptibly devoid of substance and admirable Standard merits.

The Poultryman and the Poultry

(Continued from page 959)

prise that he really had some good quality birds, a fact never known until a judge placed them under ribbons in competition with the birds of other men. Every one does not win. Many have to enter several shows before a winning is made, but that final prize is then the result of having had fowls in earlier shows and having learned the points that count by watching the work of the poultry judges.

There is no better education possible for a sincere poultry breeder than to enter his fowls in a competition with those of other breeders. Poultrymen, if they are to succeed, either financially or in any other way, must ever seek education along the lines of their business.

It develops new friendships and broadens one's list of acquaintances among poultry raisers. If your poultry venture is to be as you would have it you must develop a large circle of friends and acquaintances. It is not only pleasant, personally, but it is a business asset. Many an enthusiastic poultry keeper today is simply marking time because he is so unknown to the public that is interested in buying what he may have to sell.

There is an opportunity to win substantial prizes. They may be in themselves of considerable value, but their possession for what they stand for is a great advertising possibility. A blue ribbon and a silver trophy from a poultry show of good reputation is a trump card.

There is a chance to locate desirable stock.

It costs something to enter a show in such a way as will afford a chance toward winning, it is true. But nothing is worth gaining that does not cost something. The ultimate returns will be far greater than the costs. That is a positive fact.

The writer was very much interested in the venture of a man who took some of his birds to one of the largest poultry shows in the country last winter. He had been raising S. C. White Leghorns down along the Atlantic shore in New Jersey for a dozen years. He prided himself on being a "utility" poultry man. He raised Leghorns for the eggs that they would lay. He always went to see the big poultry shows that were so near at hand in the east, but he had never before sent in any birds himself. He was a progressive sort of man, and appreciated the contribution made to the industry by the poultry breeders, and in fact, he had been one, but had hardly realized it. Well, he sent a display pen of his best Leghorns to the show. He didn't even dare to enter competition, but he showed the public

17 State Experiment Stations, Leading Poultrymen, Thousands of Poultry Raisers Use and Endorse The "SUCCESSFUL" Sectional Steel Grain Sprouter

Lower Your Feed Bill

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1922 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL" GRAIN SPROUTER

Practically All Steel—Made In Sections

With New Safety Lamp—Safe in Any Part of House or Barn

Double steel walls—metal trays. Cannot be compared to wooden sprouters. Warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold. Glass doors. Each section a separate compartment. Start with enough sections for your needs and add more as you need them. Here is a money maker. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day increases the egg yield, cuts feed cost one-third. Write for full details. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cts. Write today.

DES MOINES INCUBATOR COMPANY

WYCKOFF'S S. C. WHITE LEGHORNS

AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain—unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that the WYCKOFF LEGHORNS have been, wholly or principally, the foundation of practically every successful Leghorn farm in this country for years. This is particularly true of the flocks making the most wonderful records.

HIGH QUALITY BREEDING COCKERELS

We are now offering the most exceptional lot of early hatched breeding cockerels it has ever been our good fortune to produce. These birds are all from a special selected lot of two-year old hens of fine type, large size and wonderful layers. They are of a quality unequaled. Greatly increase the value of your present stock by purchasing some of these grand males for your next season's breeding—cockerels of this, the oldest established strain of Leghorns, and recognized by all poultry authorities as the best.

A limited number of fine selected yearling breeding hens and yearling cocks of equal grade left to spare. No more pullets of any age at any price this season.

OUR PRICES, CONSIDERING QUALITY, ARE EXCEEDINGLY LOW

Remember that we sell only QUALITY stock such as we would use for our own breeding. No second grade or bought up junk handled at any price. As we are never fully able to meet the demand, advise that you place your order early. Send for free catalog giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country.

Saves lot of unpleasant work. At most towns, at stores handling Lee Poultry Supplies. For information and FREE Book, **GEO. H. LEE CO., Dept. P-3 OMAHA, NEBR.**

that he did have some purebred Leghorns that were good ones. He did something like \$1,200 worth of business in orders for hatching eggs and baby chicks, and then at the end of the show sold the ten hens for a hundred dollars. Did it pay him to take part in the poultry show? Most decidedly; it put him on his feet. He found it time and money well invested. Perhaps his was phenomenal success, but in some measure, at least, can similar results be obtained, if poultrymen in general would participate in our great national poultry shows, our state fairs and our local exhibitions.

It goes without saying that the men who are fanciers, who are breeding poultry primarily for exhibition, will take their part. But the other men and women who help to make up the large American poultry industry should also learn to take an active part.

What to Do at a Poultry Show.

Largely through carelessness, and rarely through narrowness of viewpoint do poultry raisers fail to attend nearby poultry shows. Every one of them should. Why? Are not these reasons enough?

To renew or develop enthusiasm and admiration for the breeds or varieties in which you are interested. It cannot but be a source of interest and value to look over fine specimens of the breeds we like best. If one is raising Leghorns for white-shelled table eggs, it is beneficial to see the prize-winning Leghorns at a poultry show. Every one must admit that whatever the aim or object of chicken raising may be the fowls raised should be held as near to the ideal type as may be possible. The trend of the times is toward a better looking bird of a useful type.

To become familiar with other breeds and varieties. Poultrymen must not become narrow in their vision of their favorite breed. Develop an interest and a knowledge of the many different kinds of fowls we recognize here in America. It is fascinating to the real poultry lover to study the different types and kinds of fowls on exhibition at a poultry show. Perhaps the day may come when you will find a more attractive and more profitable breed for you to keep than you now have. Hundreds of poultrymen have bettered themselves as a direct result of finding out about other types through attendance at a poultry show.

Learn to recognize the points that go to make up quality in fowls of the various breeds and varieties. Know a good individual when you see it. When the time comes for you to buy a new cockerel or new blood lines for your strain of birds you will be in a far better position to select a good one. I have seen many a young man, who has recently started in poultry raising, standing before a cage of the variety he admired, studying the makeup, the markings, the form, the shape, and the size of the cockerel which had won a blue ribbon. His attitude was not all envy or jealousy, but was the attitude of the student who wanted to know how his own cockerels should look.

Become familiar with the names and addresses of the breeders who have good birds in the kind you want to keep or are keeping. A poultry show is a good advertising place for the breeders, and it is also a great convenience to the man who is looking for stock. Your needs may not be immediate, but store

Make Layers out of Loafers

TO make hens lay in winter you must feed *growing* green food that is rich in vitamins. Sprouted oats furnish the best of such food at lowest cost.

This home-made Oat Sprouter was made in one evening by a 14 year old boy with no tools but saw and hammer. The total cost including the heater was \$2.49. Thousands of these sprouters have been made at home by poultry keepers, and hundreds of testimonials prove that it is the cheapest to make, easiest to operate, and handiest and best oat sprouter ever built. It will supply better and sweeter sprouted oats with less fuss and dirt and work than any sprouter made, no matter how expensive. I will send you, free, easily followed plans for building this oat sprouter together with a full description of the Little Putnam Stove with which it is heated. The price of the Stove is \$2.00. Plans for building the sprouter are packed in every stove, also instructions for using the stove to keep the water in poultry fountains from freezing.

Don't go through another winter without an oat sprouter. You can't afford to be without one even though you keep but eight fowls. Get a Little Putnam Stove from your dealer now. It will pay for itself many times before spring. Most dealers keep them. If yours does not, send me his name and \$2.00 and I will send you the stove postpaid. Try it and if you do not find it all I claim and are not perfectly satisfied, send it back in 10 days and I will refund your \$2.00 together with the postage for its return. I'll run all the risk.

Plans for building this Oat Sprouter, sent free on request.

I. PUTNAM

Little Putnam Stove keeps water unfrozen—not hot

up that information for future use. A point for one beginning in the poultry business to learn is that he must know where he can get stock in his chosen breed or variety and in the profitable strains.

Cultivate friendships among poultry breeders. Friends are an invaluable asset in any business, and they make life more worth living.

Boost for pure, Standardbred fowls on every farm, for every suburban flock and on every commercial plant. The poultry shows are potent factors in spreading the gospel of better quality in American poultry.

There are unfortunately many poultry lovers who are located where it is practically impossible for them to avail themselves of these opportunities of attending poultry shows. Let them read diligently the accounts of these shows in the poultry papers and press. The write-ups of these shows are made, or should be made, for their benefit. Fortunately, high standards of the responsibility that the show reporter owes to his readers, are today being set.

The American Poultry Shows are advancing the interests of the entire poultry industry, and in so far as all poultry raisers contribute an interest in them and make use of them, will they continue as benefactors to poultrydom.

Buff Leghorns.

What constitutes good Buff Leghorn type? A good Buff Leghorn type should be the same as good White Leghorn type. All Leghorns should have same type, although the White variety, which is most perfect, is regarded by some as having been over done in regard to some characteristics, such as fine comb and low tail. Some regard beautiful narrow blade of combs, seen on the White Leghorns at our best shows, as effeminate, while the breeders of these combs aver that they are only effects of continuous efforts to attain perfection.

It certainly must be conceded that strong masculine qualities and prepotency in regard to transmitting heavy egg production, are the first requisites. No under-sized hens or pullets should be awarded prizes. At one of the best, if not the greatest state fairs, the writer saw a very poor, under-sized hen that won first, a veritable cull; while a hen nearly twice as large, belonging to the same exhibitor, won second. The poor layer must go. And if large combs are a necessity they will have to be bred.

Good Leghorns must have nice, long, rocker shaped backs, with tails carried at the right angle, not too high or too low. Good full breasts, good thighs not to high up on legs nor too low. Neither shall the length of body be carried to extremes. For color, we must have a shade of golden buff and no other shades. Straw color and cinnamon are not buff; nor is red. The male is usually one tone of color darker than the female. A large breeder of Buff Leghorns remarked to me that it was no job to breed them dark; anybody could breed them dark; and that it was a job to get them light. I want to remark that too light a color is as bad as too dark. Lemon or straw color is too light a shade to become popular. Individual preference must be set aside for the only shade of buff: the popular shade; medium golden buff.

There should be an even color in every section without shafting or meanness. The male must have a beautiful golden color that glitters and then blends evenly and gradually into the soft breast color. The breast color of the male is a trifle lighter than the breast of the female. Pepper is to be avoided. Either black, pepper or white are serious defects and should not be used in breeding.

Both male and female must be symmetrical in type, harmonious in one soft blend of color; and all extremes in both type and color must be avoided.

Egg production must be a paramount consideration for the useful must not be sacrificed for the beautiful. Both can be combined in one. All other points being equal, the high producer should score over the under weight, cull specimen.

Pennsylvania.

Leon H. Lester.

Winter Eggs

OVER eighty per cent of an egg is water. To get lots of eggs in winter you must keep unfrozen water constantly before your hens. One cold day, with water frozen, may stop egg production for a month. A Little Putnam Stove keeps the water at just that tonic temperature best relished by the hens. The increased egg production from a pen of eight fowls will pay for the stove in one month. Don't "mon-key" with frozen fountains this winter.

The Little Putnam Stove is protected by basic patents. There is nothing like it in the world. It is made of galvanized iron and brass; is 9" in diameter; 4" high; holds 3 pints of oil, and *burns a month without filling or trimming*; consumes only one tablespoonful of oil in eight hours; fool-proof and fire-safe; *keeps water from freezing in zero weather*; used under any can, crock or fountain; also used to heat a Putnam Home-made Oat Sprouter. Plans for building Sprouter go with every Stove.

Get a Little Putnam Stove from your dealer now. Price \$2.00. Most dealers keep it. If yours does not, send me your dealer's name and \$2.00 and I will send you a stove postpaid. If, after use, you do not find it all I claim, or are not perfectly satisfied, send it back in 10 days and I will refund your \$2.00 plus the postage for its return. You can't afford not to try this wonderful invention. You do not risk a cent.

Write today for instructions how to build Oat Sprouter or Brooder—they're free.

Specialty Club Standards.

By Theo. Hewes.

I wonder how many readers of the October issue of American Poultry Journal read the article by A. F. Rolf, secretary of the National S. C. White Leghorn Club? That issue of the American was crowded with manuscript and the editor apparently had to shift this article into the narrow margin under 6 point type. Really, that article should have had a 3 column headline and been set in 10 point type, for Mr. Rolf says more in about a half column than has been said in all of the poultry journals in the past five years, and if you did not read the article, would suggest that you turn back to your October issue and read it twice.

Mr. Rolf has written along lines that quite a few other club secretaries have been thinking along for sometime, and it is up to the American Poultry Association to stop, look and listen. In his article, Mr. Rolf makes the statement that he is well aware of the fact that the American Standard of Perfection is a copyright book, and that the American Poultry Association owns a copyright on this book; but he goes on to explain that no man or association has any copyright on the English language, and that just as good a description of a White Leghorn could be furnished by the White Leghorn club as is given in the present Standard of Perfection.

It is on this point that Mr. Rolf has set off the fireworks and has given everyone, who thinks 5 feet ahead of his nose, a realization of what the result would be if the National Single Comb White Leghorn Club, and a few other progressive specialty clubs, should decide to issue standards for their breeds and give them to the public free of charge.

You boys with the rainbow vision, who are trying to make yourselves and the public believe you have a perpetual asset in the sale of the Standard of Perfection, might just as well turn over and get out of your trance, for five big specialty clubs could knock the props out from under you and not hurt their business in the least.

In this article there is no threat conveyed, there is no grandstand play. It is a good, sensible, well written article in the interest of the breed that Mr. Rolf is interested in, and he voices the opinion of 90 per cent of the members of the American Poultry Association when he says that the distribution of our Standard is not sufficient, and that the expense of our Standard is too high to reach the average man and woman who is breeding White Leghorns for commercial purposes.

Now that we know what Mr. Rolf is thinking about and inasmuch as many of us know what other specialty clubs are thinking about, long enough in advance of our next revision to give this matter the attention it deserves, let us decide to issue a Standard low enough in price to cover the points made clear in Mr. Rolf's article.

We have been talking about "separate breed Standards" for the past ten years and we have finally issued two of them, but instead of making them a breed Standard, we have made them breed books and we have spent

No-Cold Brooder Stove

Greatest Oil Burning Stove Ever Invented

Absolutely Wickless Blue Flame Burner, Heavy Cast Metal Top, Removable Canopy, Glass Oil Fount, Automatic Valve and Damper that holds the heat up during the night.

Plenty of heat for coldest weather. Only Fire-proof Stove Built. Easiest of all to operate and will help you to raise strong, healthy chicks.

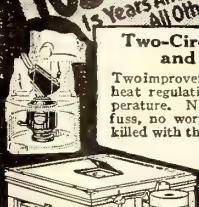

Mr. L. B. Knight, Pacific Jct., Iowa, says: I must tell you that the No-Cold Stove bought of you is everything you claim for it. No dirt, No work, simply keep oil in the tank. Once regulated it is absolutely Automatic. We have hundreds of letters similar to this.

SICK CHICKENS?

89 per cent of sick chickens are sick because of vermin, colds, roup, canker, indigestion, bowel trouble, chicken pox, skin disorders or over-feeding. No expert diagnosis needed.

GERMOZONE is the best remedy for all except the vermin (Lee's Lice Killer takes care of that) and the over-feeding (easily remedied). The best about Germozone is its wide application or use; its quick and sure results; and its wide sale—easily obtained at most every town, generally the dealer who handles Lee's Poultry Supplies. If no dealer there, order by card, 75c or \$1.50 size with free books. Send no money. Postman will collect. No extra charge.

11 Hens Laying 221 Eggs a Month

Almost Gave Up Raising Chickens.
Then She Tried This Plan.

"When I accepted your offer and tried Don Sung, I was getting 1 or 2 eggs every other day. The next month, using Don Sung, my 11 hens laid 221 eggs. I almost quit raising chickens, but now I will raise as many as I can."—Mrs. F. C. Young, Bellefonte, Pa.

You can easily start your hens laying and keep them laying, even in coldest winter. To prove it, try this:

Give your hens Don Sung and watch results for one month. If you don't find that it pays for itself and pays you a good profit besides, simply tell us and your money will be cheerfully refunded.

Don Sung (Chinese for egg-laying) is a scientific tonic and conditioner. It is easily given in the feed, improves the hen's health and makes her stronger and more active. It tones up the egg-laying organs, and gets the eggs, no matter how cold or wet the weather.

Don Sung can be obtained promptly from your druggist or poultry remedy dealer, or send 50c for a package by mail prepaid. Burrell-Dugger Co., 214 Columbia Bldg., Indianapolis, Ind.

so much money on the text and illustrations that we are compelled to sell them at a price as high as the complete Standard.

Why do we do this? Why do we keep on piling up great stacks of manuscript and spending our money recklessly in printing books that are too expensive for the average man and woman to purchase, when a small pamphlet describing the several varieties of a breed together with that part of the Standard which treats on disqualifications and cutting for defects that apply to the breed, could be printed on a good quality of paper and sold for 25 cents, at a profit to the American Poultry Association of 100 per cent?

Make these breed Standards so cheap that every breeder of Standard-bred poultry can afford to buy them in 100 lots and give them away with every purchase of stock, baby chicks or eggs. Do this and you will get your Standard in circulation in a way that will increase the interest in the American Poultry Association and Standardbred poultry.

I wonder if the readers of the American Poultry Journal realize that a great percent of the people who are now breeding Single Comb White Leghorns for market purposes have no knowledge of what constitutes a Standard bird of this breed? And do you realize that 95 percent of these people would be glad to breed Standard poultry of this breed for the same purposes, if they were taught to realize that the same results could be obtained by the better looking fowl? If we had 1,000 copies of the Standard in circulation where we have now one copy, we would have 1,000 people talking about the American Poultry Association where we now have one. The only way to accomplish this end is to put the price of the Standard at a point where price itself is an inducement for this class of people to purchase a Standard, and then call on the prominent breeders of Standard fowls to help you circularize it.

For years I have believed that a Standard entirely devoid of illustrations and printed on good book paper could be issued and sold at \$1.00 and wholesaled at probably 50 cents and still give to the fancier all the information required to breed exhibition specimens. Why go on piling up enormous expense doing everything that we do in a de luxe fashion and catering to 5 percent of our breeders and ignoring the 95 percent that are of decidedly more importance?

Let us all get off the high horse, and as old Abe Lincoln said, "Get down among the hog and hominy people awhile." They are in the majority today, and they will always remain in the majority, so let us cater to them for once in the history of the American Poultry Association.

The Molt.

Molting in chickens and birds is the dropping of the old feathers and the growing of new feathers. It is Nature's way of supplying the fowl or bird with a new covering of feathers, as the old ones, that have gotten thin and threadbare, would not be warm enough during the winter months. Hens generally molt from August un-

til and including December. During this period laying ceases, except in some rare instances, the time of molt depending mainly upon, first, the hen itself, general surroundings, feeding and broodiness.

An early molting hen certainly has not been as good a producer of eggs as a hen coming into the molt later, providing, however, that both had the same chance and the same care. Some hens are naturally built and bred to lay more eggs than others, and this kind invariably molt later than hens that are not endowed with those characteristics.

General surroundings have a very important bearing on the molt. In sanitary quarters, bare runs, lice and mites all prevent a good egg yield and consequently an early molt follows. The same may be said of feeding. Birds on a spare ration, forgetting to supply mash regularly, or a sudden change of feed help to bring on the molt. Hens can be forced to molt very easily by simply reducing their regular amount of feed.

A broody hen in the spring and early summer will start to lay again after weaning her brood, but a broody hen in the late summer or early fall is very apt to molt after weaning her chicks and sometimes does molt while still brooding them. In other words, the total stopping of ovarian activity tends to bring on the molt. The factors mentioned, therefore, have a direct bearing on the molt and are also associated with it.

Hens sometimes molt a little, stop, and start to lay again, and finish molting later. Others molt right through, the average time being about three months. Others again go through the complete molt in from six to eight weeks. Early molters take the longer time; late molters generally go through the job quickly.

An instance of how sudden changes of feeding may cause a molt came to our attention last August, a year ago. One of our neighbors, a Barred Rock breeder, had omitted his mash ration for about two weeks, when most of his hens showed signs of molting. When the mash was replaced some of these hens resumed laying and did not finish the molt until early in November.

In molting, the neck feathers are generally the first to go, followed by the back feathers, body feathers, wing feathers and tail in the order mentioned. In culling practices the molt plays an important part, the probable time a hen has stopped laying, or an estimate of how much longer a hen will remain unproductive can be ascertained by closely observing the wing molt. Hens never lay while dropping their feathers, but may start to lay while growing feathers.

The male birds during the molt are less gallant, and when in full molt some are absolutely greedy and pick the hens at feeding time, so that they may get as much as possible for themselves. A molting chicken is a delicate piece of live stock, requiring more care and attention now than at any time during the breeding or laying season, and if given this, will come through the molt in good shape and be ready to take their places in the show room or laying pen.

Md. Louis M. Schneider.

Fowls in Close Confinement.

Almost every article I see on poultry raising urges large range for growing stock and also good yards for laying stock.

I know but very little about the poultry business, but I wish to briefly state my own experience the last two years in back-yard poultry keeping.

My first venture in keeping poultry in close confinement was two years ago in August, the 25th day. I started with fifty baby chicks in a coop four feet square. A few cool days the first two weeks reduced my flock to thirty-one.

I continued to keep them in this small coop until they were two months old, when I added another coop of the same size and these coops were only eighteen inches deep, and were set upon trussels to make it more convenient to care for them. At three months of age the largest of them were fine broilers and we began to dispose of them until there were seventeen pullets left.

On the fifteenth day of February I found two eggs in this small coop. I then built a cheap shelter for them, six by ten feet, and by the time they were seven months old they were all laying. These were the Barred Plymouth Rocks, all of them, as this is my favorite breed. Some of them made splendid records as steady layers.

On March 15 of that year I hatched sixty chicks of the Barred Plymouth Rocks, and raised fifty-seven of them, in very close confinement, always under shelter, never any yard for them to run in, and on September 4 got my first pullet egg, before they were six months old. I culled them until I had seventeen pullets left, and in October they averaged nine eggs each, November ten eggs each, and December nineteen eggs each for the whole pen.

These pullets continued to lay well until I sold them last spring. The eggs produced in December were sold at the high price of 80 cents per dozen, and the net profit for December was \$1 per hen. I fed the ready mixed poultry feeds with an occasional feed of sugar beets just thrown in to them whole.

I did not in any way "baby" my hens or feed them anything which I could not have easily fed a thousand hens. Never fed any cooked feed or hot mashers. My hens were always healthy. My house is of the open front type with canvas shutter for stormy weather. They are so situated also that they never see the sun shine in the winter. I would, of course, prefer a south front with plenty of sunshine, but could not have it for mine.

Illinois.

F. E. Andrews.

Boys' Success with Buff Leghorns.

Ever since the Buff Leghorns were admitted to the "Standard" they have made great headway in the race with the other standard varieties for breed supremacy. They have passed many breeds and now tie with the leaders. But they should not stop there; they should lead.

It has been said that "the fittest shall survive." Well, the Buff Leghorns are one of the hardiest of all breeds; their eggs are among the largest, bringing the highest prices on the big markets. The cockerels are the first to mature and can be sold when prices for broilers are high. They are the best layers as will be proven in the next few laying contests.

Last year I had an average of sixteen hens. In the forepart of the year they were kept under poor conditions. In spring and summer they were kept in a yard about six feet wide by twenty feet long. I could not tend them the way I should have cared for them, because there was little time beside going to High School half a day, and the rest of the time I took my brother's part at home, that he could do his bit "over there." But even under these conditions my little buff biddies gave me a profit of over sixty dollars.

The past fall and winter, an easy one for Wisconsin, many breeders have said that their hens did not lay. This included breeds from the Langhans to the bantams. The only ones in our community who have said their fowls were doing fine, were my customers, the Buff Leghorn breeders. I am proud to be the first one to take up this fine variety in my vicinity.

Now, Buff Leghorn breeders, keep your eyes open and watch our breed take the lead and hold it.

Pick Out the Layers.

Watch for the best layers through December and January and mark them for breeders if you have to build a special yard to keep them confined through February, March and April. This will insure you eggs next winter, if you hatch them early and grow them well.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

Could you please give me information regarding climate, soil, and market facilities of land in the vicinity of McEwen, Tenn. Would it be good place for poultry raising?
Michigan. Geo. R. Eddy.

The soil in the vicinity of McEwen is of a nature not adapted to the raising of general farm crops. The local markets are good. The climate is mild as regards winter temperature, while the summers are delightful. It is a favorable location for the raising of poultry.

* * *

When I took charge of a church here as pastor, some five years ago, I purchased and set out some fine currant bushes—Fay Prolific and Large White Grape. I shall move to Michigan to take charge of another church there, and I would like to take the currant bushes along. We have just gathered this year's crop. Will it be possible to take up each bush with a chunk of earth, place in a box, water same thoroughly and then put them in the freight car with my household goods? We move a distance of about 500 miles and the car must be switched from the C. M. & St. P. Ry to the Pere Marquette in Chicago. I am told it will be in transit from four days to about a week, depending upon conditions. Can I take up these bushes now and successfully take them along or will it be better to have them shipped to me late in the fall or early in the spring?
Minnesota. Mattie J. Duven.

You can move the currant bushes as you desire. Advise you to take part roots, with but little top. By so doing you will have a better bush in a year from the transplanting. Would not attempt to remove these bushes in their entirety. Wrap the bush parts separate from the parent bushes in moist straw. Then again wrap with paper and cloth.

* * *

We are interested to buy a farm in Wood county, Wisconsin, and to raise chickens and ducks, beside general farming. Is the climate to severe to raise turkeys in said county? I have chickens here—White Leghorns—but only on my back lot. Could a man succeed in poultry business there? Also what kind of fruit trees could I set out and have success. The farm is located one mile from Nekoosa, Wis., so I think it would not be hard to have customers and market in the neighborhood.
Illinois. V. Eckstrom.

The climate in Wood county, Wisconsin, is not adapted to the raising of turkeys and poultry. There is no reason why a man who understands the raising of fowls and egg production can not make a success of this business in the section to which you refer—if he is a good poultryman and a good business man.

* * *

How about western North Carolina for beef cattle and hogs? Near what town would you advise locating? Where are the markets for these products? Could an experienced farmer find a job in this locality? Any call for carpenters, or where could I get detailed information?
Illinois. R. Greunbery.

Western North Carolina is a favorable section for the production of hogs and cattle and fruit, especially apples. The section of which Asheville is the center is as good as any in the state in this respect. The markets are the large nearby cities. Write the Chamber of Commerce, Asheville, N. C., for detailed information.

I have one-half acre that I would like to put into bush fruit. My market is St. Louis, seventy miles from here. Of raspberries, currants, or gooseberries, which would find the most ready market in the city and would be the most profitable to plant and stand shipment well by ordinary express? What could a person expect to realize under normal conditions from such fruits?
Illinois. D. C. Wiegmann.

Advise you to plant Fay and Red Cross currants, Oregon Champion Gooseberry and Cuthbert and Royal Purple raspberries. These fruits should yield a profit of \$600 to \$800 an acre.

* * *

Is the country around Charlottesville, Va., suitable for fruit, berries, poultry? What is the general character of the land? Is there any other section of Virginia that would be better adapted? If so, where?
Wisconsin. D. E. Wetherley.

The section of which Charlottesville is the center is exceptionally favored so far as climate, good land, good markets and social conditions are concerned. Fruit, both large and small and poultry find an ideal condition there. No other section of Virginia or elsewhere is better suited to fruit and poultry production.

* * *

Is the region around Colorado Springs a good location for a small fruit and poultry farm? I understand it is possible to get places there reasonable and that there is a good market.
Indiana. M. O'Hara.

There is some land near Colorado Springs suitable for small fruit and poultry production. You must need be very careful in your selection of land in that vicinity when purchasing land for fruit and poultry.

* * *

We are thinking of setting out in our poultry yard some plum trees next spring. What kind of plum trees would you advise us to get and where could we get them. Also what kind of gooseberry bushes would do well here in this part of Colorado. Please tell us what you think would be the best kind for the poultry yard.
Colorado. Miss F. T. Johnson.

Advise you to plan Surprise, Burbank, Omaha and Terry plum trees in the poultry yard. Oregon Champion gooseberry is best suited for your climatic conditions.

* * *

I would like a little information regarding Palm Beach county, Florida, as I wish to go there. Is it suitable for poultry? What about the land, also the climate? Has the government done any draining of the Everglades, and what is land worth there?
Oregon. Fred Lockwood.

Palm Beach County, Florida, is well adapted to the production of fowls and eggs. The market is good, especially in winter. The land is practically all sand. Prices range from \$500 to \$700 an acre. Far outlying land can be bought for less.

* * *

Kindly advise me as to the varieties of the following fruits best suited to my place at Walnut Grove, Mo., twenty miles north of Springfield, Mo., apples, peaches, cherries, pears, plums, quince, strawberries, blackberries, grapes, raspberries, gooseberries, currants.
Missouri. J. R. Ray.

Apples—Delicious, King David, Golden Delicious.

It Saves Money

To get the biggest profits you must have hen houses that do not take up the extra time and labor that henneries usually do. At all times they must be dry, clean and sanitary.

Illustration shows a bale of O. K. SANITARY POULTRY LITTER, ready for shipment.

O. K. Sanitary Poultry Litter

will give you these extra profits because it will last indefinitely if used according to instructions, needs no attention during the time it is in use, and at all times it is clean, sanitary, vermin free and dry.

Sample sufficient to cover 8 square feet, 2 inches deep, \$1.00 East of Mississippi; \$1.25 West of Mississippi River; \$1.50 West of Rockies.

Requires less labor

No special cellar is required for CANDEE installations. Sectional not only in construction **but in operation**, CANDEE, with its exclusive, patented, double automatic heat control and perfected ventilating system compels a constant hatching temperature in each compartment regardless of changing climatic conditions as well as safety against robbing the eggs of their original moisture.

CANDEE Incubators

because of these perfected automatic features, approach as closely as is mechanically possible actual hen-hatching conditions. As a result CANDEE chicks are sturdy and rapidly develop into strong, vigorous, profitable birds.

The automatic control devices save fuel cost, time, labor and worry for the operator—all important items in successful incubation.

Investigate the Candee

* * *

I am just starting in the poultry business, quit my trade and bought a farm of forty-two acres, which has a gradual slope from east to the west, soil is a good sandy soil. I am thinking of setting out some asparagus roots and strawberry plants. Will you kindly advise me the kind best suitable for this climate, about 100 miles south of Erie, Pa., in Mercer county? I have never had any experience at farming, have kept the White Leghorns for about twelve years on a back yard in the city and been very successful, but I realize that it is different keeping twelve to fifteen to keeping 500 or 600, which I now have. I want to raise strawberreis and asparagus and garden truck on the side.

Pennsylvania, Geo. E. Snyder.

Advise you to plant Dunlop, Haveland, Sample and Brandywine strawberreis and Palmeto asparagus.

* * *

I have bought ten acres of land seven miles from Savannah, Ga. Could you tell me if poultry will do well there? Also, what is the best kind of fruit trees to plant. Also grapes? Is there any special breed of poultry that does better so far South. I fancy Plymouth Rocks, but a friend tells me they do not do well in a hot climate.

Iowa, J. J. Jones.

Yes, poultry is being raised successfully in the vicinity of Savannah, Georgia. Consult state horticultural authority as to best kind of fruit trees to plant. The Leghorn and R. I. Reds seem to be in the big majority in the South. Barred Rocks do well there. I have seen some very large flocks there which are profitable.

* * *

I am sixty-four years old and I want to raise apples in my lifetime. I have no trees large enough to graft.

1. What is the oldest apple tree I can transplant and graft?
2. Will Delicious Scions grafted on wild crabapples produce fruit?
3. Will any Scion grafted on wild crabapples produce?
4. How large a crabapple will I graft on?
5. Which of the Hansen plums will I plant and where?

I have a Waneta and a Hauska. Will I plant more of them?
6. Will raspberries, planted this year with four and five feet canes, take root and make good plants if the ends are covered with dirt, or must I wait another year?

New York, L. E. James.

1. It is not advisable to transplant an apple tree more than three years old, although it can be done.
2. Delicious Scions put on wild crab trees will not "take" well. The Delicious wood will grow larger than the wood of the wild crab and then brake off.

3. No, not as a lasting tree.

4. Answered by 2 and 3.

5. Waneta, Hauska, Opiota are best of the Hansen hybrids.

6. Cut raspberry cane off to six inches of root when transplanting.

* * *

Would you kindly supply me through the columns of your department with a list of apple trees suitable for middle Minnesota climate? Also several varieties of grape vines?
Minnesota, H. L. Shockley.

TIFFIN, OHIO

Wealthy Apples are best for Minnesota planting.

Plant Bertha, Concord and Worden grapes. These are very hardy.

* * *

As I desire to move to a higher altitude than this is, your opinion of the vicinity of Knoxville, Tenn., impresses me favorably as a good section for poultry, dairying and fruit.

As you frequently have advised raising poultry in conjunction with general farming rather than poultry raising alone, my idea is to combine general farming in a small way, say twenty to forty acres, with poultry and fruit, with cows enough for home use and to supply chickens with skim milk.

In your opinion, would the Knoxville section, Loudon county, or Rockingham county, Virginia, be most desirable?

Is the soil at Knoxville adapted to the growing of corn, wheat and other grains suitable for poultry feed?

As land will probably be higher priced near Knoxville than at smaller towns, could you mention some good little railroad town where the conditions are as good as at Knoxville, in good neighborhood and with good shipping facilities?

A. MacAslan.

Ohio.

You must decide the matter of location for yourself. I personally prefer the Knoxville section for the purpose of which you will buy a farm.

Yes, the soil in Knoxville County is well suited to the growing of the farm crop you name, and which comprise poultry foods.

There are numerous small towns near Knoxville, within easy reach of good farm lands. Go down and make a personal inspection of that country.

A Contagious Ovarian Disease.

The following is a description of what I call Contagious Ovarian Disease of Fowls, which I have noticed among my birds since December, 1913. Previous to this time, for a period of about fifteen years I had kept no fowls. At first I did not realize what the disease was. It took me about five years to find out that the disease was contagious. It is not only contagious, but is transmitted from the old fowls through the eggs, and is also transmitted through the male as I will show later on. The symptoms vary somewhat, but in general they are the same, varying only in the individual case. I have not lost any birds directly through the disease, but indirectly I have, through the over-attention of the male while the birds were in this condition and could not escape the male.

The disease seems to affect the shell-making portion of the oviduct, causing the birds to lay soft shelled eggs. As a rule the birds do not go to the nest to lay but drop their eggs most anywhere. Needless to add they all contract the egg eating habit. The bird that lays is usually the first to eat her own egg. I have killed quite a few birds while in this condition and always found a soft shelled egg in the shell-forming portion of the oviduct and the oviduct highly inflamed. The birds which I have lost through the over-attention of the males had a soft shelled egg in the shell-forming portion of the oviduct. Two of the birds I had, had eversion of the oviduct and in both cases the oviduct contained a soft-shelled egg.

Some of the birds will lay a few normal shelled eggs before they show any signs of the disease, while others show the disease from the time they lay the first egg. All of them seem to have an abnormal appetite for shell and eat great quantities of them, especially while containing an unlaidd egg. I have had them fill their crops with shell at this time.

Chicks, hatched in an incubator, from eggs laid by infected hens, and raised on new premises, not near any other fowls, were afflicted with the disease when grown and in laying condition. This has happened on two occasions where I took particular pains to keep them from coming in contact with infected birds.

In the fall of 1920 I purchased some laying pullets and placed them with a male bird hatched from eggs laid by infected hens and in about a week or ten days they had the disease.

At different times the birds have been supplied with lime water, old mortar, different varieties of patented grits in addition to a regular supply of oyster shell and still the disease continued. All the well known brands of dry mash have been tried as well as some specially prepared mashes containing fish meal,

The Feed for Winter Eggs

Sucrene Buttermilk Egg Mash contains Dried Buttermilk and Meat Scraps in combination with a variety of high quality meals, which makes it a complete egg-forming ration. Let your hens have free access to this feed at all times; give them a liberal grain feed in the evening, and you can depend on profitable returns in eggs all through the winter months.

Put up in 100, 50 and 10 pound bags. Give your dealer a trial order. Write us for full information.

AMERICAN MILLING COMPANY

Dept. 1 PEORIA, ILL.

1000 EGGS

In EVERY HEN

If You Keep Chickens
CUT THIS OUT

"The great trouble with the poultry business has always been that the laying life of a hen was too short," says Henry Trafford, International Poultry Expert and Breeder, for nearly eighteen years editor of Poultry Success.

The average pullet lays 150 eggs. If kept the second year, she may lay 100 more. Then she goes to market. Yet, it has been scientifically established that every pullet is born or hatched with over one thousand minute egg germs in her system—and will lay them on a highly profitable basis over a period of four to six years' time if given proper care.

How to work to get 1,000 eggs from every hen; how to get pullets laying early; how to make the old hens lay like pullets; how to keep up heavy egg production all through

cold winter months when eggs are highest; triple egg production, make slacker hens hustle; \$5.00 profit from every hen in six winter months. These and many other money making poultry secrets are contained in Mr. Trafford's "1,000 EGG HEN" system of poultry raising, one copy of which will be sent absolutely free to any reader of this paper who keeps six hens or more. Eggs should go to a dollar or more a dozen this winter. This means big profit to the poultry keeper who gets the eggs. Mr. Trafford tells how. If you keep chickens and want them to make money for you, cut out this ad and send it with your name and address to Henry Trafford, Suite 860 D, Court Bldg., Binghamton, N. Y., and a free copy of "The 1,000 EGG HEN" will be sent by return mail.

which is high in bone or mineral content, with the same results.

The only thing that seemed to help them was unlimited range and then they again developed the disease after having been on a fixed range for any length of time.

To show that it is not in the care given the fowls, I will state that at various times I have procured new birds and when not brought in contact with the infected fowls they continued to lay sound shelled eggs, but as soon as they came in contact with infected fowls they also contracted the disease.

I have given some of the infected birds to other people who kept no fowls of their own and the disease continued.

It makes no difference what the breed or variety, they are all subject to the disease. I have had Langshans, Reds, Wyandottes, Leghorns, Games and Bantams, and all contracted the disease.

I also think the disease can be contracted by other birds, as the following may indicate. Last summer I purchased a pair of Ring Doves and during the summer they laid two pair of eggs and hatched their young. During the winter they were kept near the fowls and this spring I noticed that the female acted more or less like the hens. She kept to the nest and acted as if she wanted to lay. She finally laid a pair of eggs and broke them both, as they were so thin shelled. She had been well supplied with grit and shell. After she had laid she seemed to be in good condition again.

The following are the principal symptoms: Some of the birds when first taken with the disease seem to be just a little sleepy and walk around in a lazy sort of way. They do not seem to have much of an appetite, and what food they have in their crop does not seem to digest. Other birds walk as if they were a little lame and step around in a jerky sort of way. Others again do not seem to be able to keep their eyes open and sit around with their eyes closed. Some of them become so helpless that they are not able to walk about at all. They do not seem to have any strength whatever. Those that are affected the most lie down with their heads down on the ground and look as if they were about to die. If you pick them up their heads, feet and wings hang limp and helpless as if they were dead. They remain in this condition until they have laid, after which they seem to be in the best of health until it comes time for the next egg, when they pass through the same symptoms again. Those that show the lighter symptoms are well immediately after the egg is laid, while it takes those somewhat longer to recover that have the more severe symptoms. The majority of the birds when in this condition ruffle up the feathers of the cushion and spread their tail feathers apart and carry their tails rather low. If they have an attack while on the roost—they are not able to hold themselves, but usually fall down to the droppings board or floor. Some of them do not seem to get any worse but continue to have the same symptoms. Others begin with the lighter symptoms and get worse as the disease progresses while others begin with the worst symptoms and continue in this condition as long as they are laying.

This disease may explain the prevalence of soft shelled eggs in some flocks. There appears to be a similarity between it and contagious abortion in cattle. The oviduct is inflamed and the disease is communicated by the male. If this infection should ever hit an egg farm it would put it out of business. Therefore it is worthy of the study of poultry pathologists.—A Subscriber.

Housed for Winter.

In what condition are your poultry houses for the indoor life of winter?

The months between now and spring, during which your birds spend so much time closely crowded together indoors, are the months in which it is most important to have light and air and freedom from disease germs, lice and mites in your birds' living quarters.

Radiation of sunlight will be increased, the air purified and sweetened, and disease germs, lice and mites kept in control during these critical months by the use of a good disinfecting paint.

It is better to do your interior painting and disinfecting before freezing weather, so you still can keep doors and windows open for quick drying, and thus avoid putting your birds into even temporarily damp quarters during the cold months.

A few hours spent now in cleaning up for the winter will bring a return to you in increased production from healthier hens that may make those clean-up hours the most profitable hours of the year.

Six Generations of Breeding for Eggs.

(Continued from page 957)

grand sire of the male and female used, was the same bird, No. 3496. Moreover, the hen (2036) that was used to produce the male in the 5th generation, was a daughter of male No. 1024 and a granddaughter of male No. 756, and she was mated to male No. 4874, who was a grandson of male 1024, and a great grandson of male No. 756.

This is the intensification of blood lines through inbreeding and being followed in a systematic way, is called line breeding, which means breeding in line from prepotent sires and dams. No detriment to the stock has resulted, and Lamon's Triumph is an outstanding bird for vigor, because the parent stock of each succeeding generation were selected for strong constitutional vigor.

If people instead of speaking of the bad effects of inbreeding, would speak of the bad effects of breeding underdeveloped or weak birds, they would come nearer to "hitting the nail on the head." Bad results from inbreeding are yet to be established.

Size, for instance, may indeed be increased by the closest kind of inbreeding if selections of breeding birds are made for heavier bone and larger stature. Selection is the keynote.

In this connection, observe Fig. 11. Here is a hen which laid 235 eggs in her pullet year. She is a half sister of No. 2058, which laid 240 eggs, and a half sister of No. 2036, which laid 208 eggs. But this hen in Fig. 11 does not appear in the pedigree. The reason is that she has poor Standard quality; a poor comb, a convex back, pinched tail and angular body. If the only end aimed for were eggs, she would be useful, but since the end aimed at is eggs plus the graceful body lines of the Standard exhibition Leghorn, this hen is rejected as a breeder. This selection and elimination is what is meant by the term selective breeding.

Standard Points.

Inasmuch as there is some agitation for fleshier combs on Single Comb White Leghorns, and some evidence in their favor, it is interesting to note that Mr. Lamon has not found it necessary to diverge from the Standard exhibition comb.

There is also some discussion in favor of larger birds in this breed. Hen No. 2086 in the pedigree, which has a record of 223 eggs, weighed 4 lbs. 6½ oz. when in the best of flesh.

Her low weight, when laid out, was 3 lbs. 8 oz. The Standard weight for a Leghorn hen is 4 lbs. and this weight applies in the winter when birds are in show condition, having molted and gotten in good flesh. At this point, hen No. 2086 was 6½ oz. over weight.

Hen No. 4017, after having undergone the continual strain of a year's production as a pullet, weighed 3 lbs. 5½ oz. This indicates that she was a little over the Standard weight for a hen when in show condition.

Hen 6602 weighed 3 lbs. 8 oz. after laying 200 eggs. No other weight of this bird is available. It is plain, however, that she would run a couple

The Morris White ORPINGTONS

The Proven Leaders

The bird for all purposes; the best winter lay of large, tinted eggs; the heaviest of all clean legged fowl; the finest table poultry in existence; the most beautiful fowl yet produced.

We have the largest and best flock in America and have hundreds of cocks, hens, cockerels and pullets, now ready for the show room, laying house and breeding pen.

Are you prepared for the keenest competition in the show room? If not, come to headquarters. Are you getting the egg yield you should? If not, improve your flock with a cockerel from our bred to lay strain that has been making high egg records in national laying contests regularly since 1911 and hold the world's record for heavy weight fowls. Last season we won nine firsts out of a possible twelve at Madison Square Garden and Chicago Coliseum.

Recent winnings: Six firsts at Cincinnati, August 25th; six firsts, Kentucky State Fair at Louisville, September 14th.

Make this test with UNCLE SAM Milk Albumen

Milk being one of the most valuable ingredients in chick foods, there is no better, more convenient and cheaper way to feed it than in the form of **UNCLE SAM MILK ALBUMEN**. It is rich with Protein the great body builder and egg producer.

Promotes Health, Growth and Maturity

This is the season to use **UNCLE SAM MILK ALBUMEN**, rich with Protein, because it supplies Vitamines lacking in grain foods and so essential to healthy growth. Purdue University found it to be the greatest egg producer known. It is used by many feed manufacturers to increase the digestible Protein of the feed. Try it for 30 days, making it 10 per cent of your feed. We offer you an opportunity to prove the value of Uncle Sam Milk Albumen for your flock.

AN EXPERT'S OPINION

Dear Sirs: I have given "Uncle Sam" Milk Albumen a careful and thorough test.

Early in the spring I selected two pens of fowls—one pen of Houdans and one pen of S. L. Wyandottes. These two pens were fed your food.

The Houdan pen thus fed laid 41 per cent more eggs than any other Houdan pen on the farm.

The S. L. Wyandotte pen thus fed laid 34 per cent more eggs than any other S. L. Wyandotte pen on the farm.

After giving your "Uncle Sam" Milk Albumen this thorough, systematic, and fair test, I am convinced that it is a very valuable food product and one which every breeder should use.

THOS. F. RIGG :-- Iowa Falls, Iowa

Trial Package 5 lbs. for 50c Postpaid

EDGEHILL GIANT SINGLE MINORCAS COMB BLACK

SALE OF BREEDERS AT REDUCED PRICES—Can supply single birds or full strings to win in any competition desired. A number of extra fine utility pullets from egg-record stock. Write for catalog.—EDGEHILL FARM, Box A, SCOTCH PLAINS, N. J.

ARNOLD'S BUFF LEGHORNS

Bred since 1890. This season our young birds are far ahead in quality; never raised such fine birds before. Bargains this month, a few cocks at \$20 each; hens \$5 each; cockerels \$5 up; pullets \$3 up. No eggs for sale the coming season. Aug. D. Arnold, Box 777, Dillsburg, Pa.

ounces over Standard weight when in show condition.

The eggs laid by hen No. 2086 weighed 56.8 grams, which is exactly a 2 oz. egg. The eggs laid by No. 4017 were a shade smaller, weighing 53 grams. Hen No. 4017 laid 245 eggs, and these high-g geared hens usually lay a trifle smaller egg. It is apparently quite easy for a hen to lay a 48 to 52 gram egg and get away up over 200.

A 200-Egg Strain.

In the heading of this article, we announce: "How a High-Producing Strain of Exhibition White Leghorns was Built Up." The question may arise, "Does the cockerel, Lamon's Triumph, come from a 200-egg strain?" In our opinion, he does not. The meaning of the word "strain" is not definitely clear, but, to our mind, it denotes an entire family that has an established heredity character. It is expected that in any strain a small proportion of birds will revert from this established trait, but the large majority should be pure for the family characteristic.

No family of chickens, of which we are aware, inherit and transmit a factor for fecundity to the tune of 200 eggs per bird, per annum. Occasional males will do a pretty good job of throwing 200-egg pullets, and in some strains there are an encouraging number of females that produce 200 eggs each in their pullet year.

But, to say at this stage of our progress in breeding that a bird is out of a "200-egg strain," even though there are one, or two, or several 200-egg birds among its ancestors, is a form of misrepresentation, provided, of course, our interpretation of the word "strain" is correct. If we are correct in defining the word "strain," then it is true that until we have flocks in which a majority of the females give a yield of 200 eggs or better, until it is true that a majority of the females are not only capable of laying 200 eggs each, but transmit their 200-egg capabilities in such a regular and orderly manner that 200 egg performance becomes the usual and expected thing and is recognized as an established hereditary character in the flock, no 200 egg strain will exist.

We do not look for the consummation of the 200-egg strain in the immediate future. Pronounced progress has been made, and just as strains have been dependably established for the factors of size, type and color markings, so may they be purified for high fecundity.

We have shown you how, in six years, a bird rich in the blood of 200-egg hens has been produced, although in the first generation not a single 200-egg bird appears in the pedigree. The stock to begin with was no better than the average breeder has.

In successive generations, those of the pullets that reached 200 eggs were used as fast as they appeared, also the males from them were in turn employed. The result is the production this year of "Lamon's Triumph," a cockerel in which there is an intensification of 200-egg blood. If he lives, and as long as he remains strong and vigorous, he will be a pen header, that many new lines of blood may flow from him. Thus we have shown you the breeding that led up to his birth.

Policy in Breed Recognition.

By F. W. Proctor

I propose to make this a reminiscent, as well as constructively critical article. My recollections as a breeder go backward nearly forty years, and during this period quite a few new breeds and varieties have come forward for recognition. Some of these have taken and now occupy a high place in the esteem of fanciers; but a much longer list failed to qualify as permanent breeds.

The attitude of the American Poultry Association has generally proven a considerable factor in the fate of new breeds or near-breeds. As an instance in point, there were the White Wonders, whose breeders came before the Boston meet of the association some years ago with a lengthy list of signers. This candidate for popular favor was undergoing a decided boom at the time. Its makeup was an easy guess, of a White Wyandotte-Light Brahma cross, and its laying and meat-producing qualities made it palpably superior to the unfinished Rocks and Wyandottes of white color of that period. The association's grounds for turning down this practically superior type, according to current report, was that it did not fill a distinct role as a breed.

This brings us to the point I wish to discuss—the principles involved in the action of the association in the acceptance or rejection of breeds. It must be apparent to observant fanciers of long standing that we lack a consistent policy in this matter. Is superior practical merit in a breed which has been brought to a reasonably permanent type, a sufficient basis for official recognition; or must it possess also distinct and well-marked exterior points, sufficiently differentiating it from other breeds and likewise capable of interesting the fancier? All breeds of prominence possess one or both of these qualifications.

The history of Standard making presents many instances of new-comers which failed on one or both of these points. In the early days of the popularity of the Asiatics just prior to the advent of our medium-sized Rocks and Wyandottes, the pea-comb Partridge Cochins gained for a time official standing. Doubtless this type had its origin in the use of the Dark Brahma as a cross.

There followed later a pea-comb Rock in both the barred and white colorations. Both these and the Cochins of that comb type have long since disappeared. There would seem to have been no more excuse for the appearance of a pea-comb upon normally single-combed breeds than the inventive whim of some upstart breeders. The frost-proof argument was put forward, but the fact is that a single comb has not proved out to be any serious objection upon a well-plumaged fowl of good size.

Quite a different case is that of the Leghorns, a rose comb upon the heads of which had doubtless proved of cold-climate advantage. Nevertheless, the Rose Comb Leghorn still remains, after a forty years' test, more of fancy than practical merit, as is evidenced by the fact that the Single Comb Leghorn remains the favorite upon egg farms. The late I. K. Felch long and

How Much Water Do Your Hens Drink in Cold Weather?

How much water do your hens drink in cold weather? Not very much we'll wager, if they have to sip between ice crystals in a pan of freezing water. Yet eggs are mostly water, and to lay well hens must drink freely.

A few years ago it was discovered that cows would drink a great deal more water during the winter months if the chill were taken off. Today, the tank-heater is a part of the barn equipment on every well-organized farm. And it has undoubtedly earned millions of dollars by increasing the milk flow.

It remained for Mr. I. Putnam, a poultry enthusiast of Elmira, N. Y., to invent a practical water heater for the poultry house. His patent device is known as the Little Putnam Stove. This stove will burn for a month without refilling or other attention. And the entire cost of operating it for a winter is only about 25c.

THE LITTLE PUTNAM STOVE.
Keeps Water Unfrozen—Not Hot.

Any ordinary drinking vessel may be used. The tiny flame of the stove supplies sufficient heat to keep the water from freezing, even in the coldest weather. But the water never becomes hot and insipid.

Supplied with plenty of pure drinking water at just the right temperature, your birds will drink freely and often. And if your feed and housing conditions are right they will shell out the eggs in a way you would scarcely have believed possible during the winter months.

Not content with having supplied the poultryman with the much-needed water-heater, the ingenious Mr. Putnam proceeded to devise a home-made oat sprouter, using the Little Putnam Stove as a heating unit. This oat sprouter can be made in an evening from materials which you can purchase anywhere for less than 50c. The price of the Little Putnam Stove is \$2, post-paid to any address. It will pay you to order one for trial at once. If not entirely satisfactory it may be returned and the money will be refunded. Address I. Putnam, Route 1105-R, Elmira, N. Y.—Advertisement.

THE LEGHORN WORLD
1031 E. Bremer Ave. Waverly, Iowa

consistently opposed the innovation; and among its disadvantages is the fact that it has ever since proved a troublesome precedent. For, based upon its example, the Rhode Island Reds came into the Standard with two types of comb. The Anconas, Orpingtons and Minorcas divide their influence among two comb type schools of breeders. Even the Leghornmen are not altogether satisfied, for a Pacific coast breeder is now becoming a breeder of pea-comb White Leghorns.

Ambitious Barred Rock breeders, covetous of unattainable blue ribbons, are strenuously attempting to foist a "much improved Rock with a Wyandotic headgear. And so it goes, ad infinitum et ad infinitum. And the point in this connection I would raise, here and now, is that the association, in its capacity of official molder of breed types should long ago have taken action upon this multiple comb menace, for it is a distinct menace to the success of exhibitions. The pea-comb Cochins and Rocks were never missed. And I believe that no breed now exists but would be better for all breeders in the long run if restricted to one type of comb and one only. If too late to reject certain breeds for the present, the rule might be formulated for future occasions. Time settles all things, and the rule has held good in the past and promises to hold in the future, that all breeds finally settle down to one—generally the normal—type of comb.

Intelligent Inquiry vs. Politics.

In the consideration of breeds suitable for sanction and encouragement by the association, more than the mere expediency of the hour, or the politics of a happy convention, should decide the issue. There is a constant demand for new breeds. These subserve both the fanciers and the practical breeders' needs. And while fostering the deserving novelty, the association has a duty towards existing neglected breeds.

The Black Java—how many of our present popular breeds are its equal for usefulness and beauty? The Buckeye; I handled this breed a few years and can testify to its unequalled practical traits. I learned to appreciate the advantage of its distinctive type of head; the broad skull, that attends the oriental or pea comb, has more room for brains and actually pans out more intelligence and companionableness than the other comb types.

I believe the association acted wisely, at the Seattle meet, in the rejection of the several breeds asking for recognition which it turned down, and for reasons I have already outlined. As to the previous action at Chicago in accepting Missouri Fluffs. I am far away from Missouri and beyond conjectures. And as to the chanticleers, was their admission a sop to the Canadian breeders in general, or to the Trappist Fathers in particular? The history of White Wonders seems to be repeating itself in the production of this breed, and the association now stultifies itself in the admission of them.

Among the interesting essays at breed making was the Argonaut, a pea-comb buff breed that was originated by Harmon S. Babcock, a lawyer and prominent writer on poultry topics, who resided in Providence.

POULTRY SPECIALIST WANTED

A very satisfactory present opening with exceptional opportunity for the future, for the right man.

We are extending our barn equipment business to include a full line of poultry equipment (such as dry mash feeders, waterers, metal nests, complete system of ventilation, etc.) and need a man to take charge of the development of sales of this particular department.

A thorough knowledge of poultry raising, and the poultry industry, in general, is essential, together with executive and selling ability.

If you are interested, write us for full information. At the same time, please give full details of your experience, stating your age, and giving references.

Small Ads That Pay

Specimens of this breed I once saw at an exhibition in that city. I have a copy of a little pamphlet published in the interests of the breed, which bears the date 1891. Therein the originator-author sets forth its merits as "the ideal general purpose fowl." A frontispiece cut by Lee shows a pair of Argonauts, of a type rather Leghorny but with a shortened tail, which is solid black in the male, the pair purporting to be otherwise buff. This breed followed close upon the advent of the Buff Leghorn to this country, and went out without ever having been largely disseminated. It was the result of studied crosses of Peacomb Plymouth Rock, Cornish, Crimson Game and a nondescript stock of buff fowls, probably a buff selection from the original and at that time, unnamed Rhode Island Reds. So ephemeral a type is now of interest in a historical way only. The above leads up to possibilities in breed making. Our modern new breeds, unlike a majority of the older ones, are generally the outcome of a studied mixing of foundation stocks with an aim to produce an original and distinct type of shape and color. In this manner Mrs. Metcalf made her Buckeyes, using the blood of Buff Cochins, Barred Rock, Pit Game and Cornish. The result proved to have been a happy selection, as the Buckeye stands today probably the best all-round product of meat and eggs, and as such just barely missed becoming the most popular fowl of the day by a time handicap — the Rhode Island Red having just emerged from its half-century of obscurity and caught the public eye.

Processes of Time.

It would be easy for the beginner with fowls to believe that some one or other of our modern breeds sum up all the possibilities of excellence. Not so easy for the veteran breeder to believe thus. I have seen, for example, the Barred Rock emerge from a very crude condition to become the marvel of beauty it now is. It is hard to imagine anything finer than the specimens Mr. Thompson now shows annually at Madison Square Garden. But we must not deceive ourselves by what the present reveals. The process of time always brings advancement. Many of our popular breeds of today will disappear. Others will be so differentiated by advancing ideals so as to gain distinctness. If breeds disappear they will live again in future breeds. It would seem as if each new occasion narrowed the field of possible distinctly new types. But that is because we lack vision.

Color types, likewise, would seem to have been exhaustively exploited long ago. But out came Mr. Card with his new and beautiful Cornish in red laced with white. Some day a constructive fancier will create a new Rock or Wyandotte (or what not?) uniformly Birchen in color, or clad in plumage like the Birchen Game's breast, and could anything be more delicately beautiful? In closing, my mind reverts pleasantly to the memories of exhibitions and fanciers of long ago. I could easily dwell upon the earliest show I attended in Madison Square thirty-seven years ago. E. B. Thompson seems the sole survivor of that far-away period, having been winning some important prizes even then. Jones Wilcox exhibited and sold a pen

24 Hens Average 183 Eggs in 12 Months

Bought Old Hens Sent to Market Gave Over 4300 Eggs in Year

"I am not an experienced poultry-man, but will tell you my experience in using Giles Poultry-Tone. I bought a crate of 24 Leghorn hens from a South Water Street commission man. I commenced giving them Poultry Tone, according to directions, twice a day for 10 days. In the meantime they had commenced to lay. I continued to give them this mixture three or four times a week. For twelve consecutive months, 1 year, I kept an accurate account of the eggs received from these hens. They gave me 4,392 eggs. Experienced poultry men told me this was an exceptional yield of eggs, especially as the hens were old."

(Signed) J. J. Bonner, Chicago, Ill.

"Giles" POULTRY TONE

Send your order today for this wonderful efficient tonic-conditioner if you want a lot of high priced winter eggs. POULTRY TONE puts your fowls in highest state of health and vigor, and keeps them there.

"Giles" POULTRY TONE will greatly increase egg production because it increases the appetite, aids digestion, makes the bowels more active. It tones up the egg-making organs, develops the egg cells in the ovary so that you get more eggs, no matter how cold or wet the weather. Mr. Bonner's experience is proof of that.

PREVENTS AND CURES COLDS-ROUP-CHOLERA
POULTRY TONE overcomes and expels all germ poisons. It combats the germs that cause Roup and Cholera and it tones up the system so the chickens can resist disease. It affords prompt and permanent relief.

MONEY-BACK GUARANTEE

POULTRY TONE is a real Poultry remedy and tonic. Always sold on money-back guarantee if not satisfied. On the market 20 years without a single request for refund. Try Poultry Tone on this plan. You can't afford to be without it. It's a sure money-maker for you.

Price, 50 cents large bottle; quart can, equals ten 50 cents bottles, \$2.50, prepaid. Send for big circular Poultry Welfare, it's free. Send your order today.

Patent your invention, and register your trade mark. Prompt attention to these matters may save you loss. Lester L. Sargent, Patent Attorney, 524 10th Street, Washington, D. C.

of Wyandottes for \$100—an enormous price, as then regarded. Sherman Hartwell was then supreme in Partridge Cochins. I saw Henry Ward Beecher inquire the price of a pen of these, which was \$100. Fancier as he was, the great preacher did not buy at what seemed a stupendous figure. This show, grand as it then seemed, would today appear as a country fair. And, judging by past advances, what of the future?

The organized fancy is largely the arbiter of new breed production, and ample judgment based upon correct principles in estimating the worthiness of candidates for recognition is most essential for the welfare of the poultry interest. And, as to the proper remodeling of Standard descriptions to accommodate the advancing ideals of established breeds, this is a matter of no less importance. The official change in the Brown Leghorn's color description, which led to the development of two varieties, has very properly been followed by recognition of the same. And so also with the Barred Rocks. Two distinct classes is the inevitable outcome of color descriptions identical for the two sexes. And popular sentiment is rapidly growing in favor of recognizing, by means of separate descriptions for the two varieties, what has become a usage among breeders.

Rapid Growth in Orpingtons.

The Rose Comb Black Orpington cockerel, which was hatched March 23, and on June 23, being just three months old, weighed 5 lbs. and 5 oz., the account of which I reported to you at the time, today, September 23, is just six months old and weighs 10 lbs. to the ounce. The writer has bred Orpingtons for many years, and has had cockerels attain the weight of 10 lbs. in six months, but this particular cockerel has not been forced for great growth, but has had good, ordinary care as one among a flock of youngsters. The Rose Comb varieties in some cases do not run as large as the Single Combs, but it seems to me that in future the Rose Comb varieties should be bred the equal to the Single Combs in ever particular.

Pennsylvania. Dr. Geo. B. Edwards.

Random Thoughts.

First it was a "certifying station" where poultry breeders could send their perfectly healthy birds to have them examined for the Bacterium pullorum germ.

Next it was a cockerel testing station where men and women who had spent half a life time breeding poultry, yet did not know how to select to head their breeding pens, could send a cockerel to have him tested as to his ability to throw a pullet that would lay 365 eggs in a year or one that would win sweepstakes at Madison Square Garden.

And now it is public registration of pedigrees.

Anything to give the theorists and "advanced thinkers" a soft job and the enterprising gent an opportunity to cash in at the expense of the poultry breeders.

After proclaiming artificial light for the hen house the greatest discovery since Columbus discovered America, the "advanced thinkers" are now advising poultry raisers to go slow in the use of said great discovery.

The line of "dope" put out by the "advanced thinkers" is great.

Let us see, was it not the same "utility" gentlemen who are now clamoring for their "birds" to be admitted to the American Standard of Perfection who a short time ago put on a vigorous campaign in an effort to convince the public that the fancy breeder's birds were good for nothing except to look at?

It seems a little strange that these breeders of the only "worth-while" fowls should desire representation in an institution which recognizes only the worthless. John Miller, Missouri.

J. S. PENNINGTON Box A PLAINFIELD, ILL.

Farm Flock of Columbian Wyandottes.

This is the month to watch the flock for winter layers, the hens which are molting should be in this class if properly cared for, give them dry, clean quarters, with lots of sunshine, warm water to drink, all the dry mash they will eat, composed of 10 lbs. clean wheat bran, 10 lbs. ground oats, 5 lbs. corn meal, 2½ lbs. oil meal, and kept before them all the time. I also give them all the beef scrap they will clean up in a few minutes. Our hens are given their first feed for morning, the night before, after they are on the roosts. Wheat and corn, about one-third wheat by measure, is sprinkled on the floor. In the middle of the day oats are fed, and at night corn, either whole, cracked or on the cob. At present we are using sweet corn that is just husked and still soft. The cockerels are being fattened on this sweet corn. The hens and pullets are on free range, but the cockerels are confined, and have an outdoor park for exercise. The pullets are being put in condition for winter laying by being fed wheat and corn.

In our experience pullets will never get too fat to lay, but hens will. Yet we want all our poultry to go into winter quarters in a fat condition, as they will lay better, and it is much cheaper to fatten them in the fall and they have this fat as a good start to keep up their condition during a heavy laying winter season. We have proved the fact to our own satisfaction that keeping the hens off of cold frozen ground makes a decided difference with the egg yield. We never let them out in the morning after heavy frosts start until the sun is up and the ground warm; and never let them walk on ice or snow or frozen ground at any time.

Our flock is full-blood Columbian Wyandottes, and by careful breeding we have made a large improvement in regard to broodiness. We take them off the nest the first night they offer to stay on, shut them in a nice large pen with big park, feed them well for about two days, then the third day we do not feed them very much and let them out toward night and as they are hungry they will usually get busy finding something to eat, and by bed time they will go on the roost instead of on the nest. By doing this each year the setting habit will be lessened unless you bring in new blood. [We doubt if you can lose the broody instinct in Wyandottes without also losing size and flesh qualities—Editor.]

Always pick your best hens for the breeding pen and set only the most uniform eggs for the best results. Our flock of 40 pullets and 28 hens last year laid nearly 600 dozen eggs. These same 40 who are yearlings now and 34 pullets laid from January 1 to October 1 634 dozen eggs. These hens also hatched and raised nearly 100 chicks. From the flock we pick 12 of the very best yearlings, not pullets for breeders. This is just a farm flock, but gives a good profit. The principles of this success are pure-bred stock, clean, dry quarters, lots of fresh air and good feeding methods.

New York. Mrs. C. J. Duxtater,

Selection for vigor is one of the fundamental practices of the successful breeder, no matter what is the object of the breeding.

Putnam's Light Brahmas, Bronze Turkeys, S. C. Rhode Island Reds, Toulouse Geese

We can please you whether you want breeders or show stock. Cockerels at \$5.00 each or 6 for \$25.00. Will improve most flocks. Extra value in young toms and ganders at \$10.00 each. Write for prices on show birds. Our stock will win for you.

Easy Way to Get Eggs

Use "OCULUM"

the great Germicide. Feed only a drop a day to each and watch your hens moult and lay. Roosters keep fertile and chicks grow a pound heavier. Bradley Bros., Lee, Mass., the celebrated B. P. Rock prize winners, after using "OCULUM" ten years say: "We believe 'OCULUM' has a place taken by no other remedy, for instance with it we saved a prize winner worth \$300 which seemed doomed in spite of our experience and skill in and use of everything else we tried. Afterwards it bred us some very valuable fancy stock. This Journal O. K.'s us. You take no risk. Sample, 10c; bottles, 50c and \$1.00 postpaid; guaranteed.

Correct Type and Color of Rhode Island REDS

BY means of the most remarkable set of Rhode Island Red illustrations ever produced, W. H. Card, secretary of the Rhode Island Red Club and the greatest living authority on Reds, in "Blue Ribbon Reds," shows in a way so simple that every beginner can understand what constitutes the correct type and color of Rhode Island Reds. There are twelve drawings illustrating type and fourteen illustrating color. These drawings show the ideal Reds, both male and female, as well as the various shape and color defects most commonly found. Mr. Card also points out which defects are serious and which are of only minor importance. Other subjects in this wonderful book on Rhode Island Reds are:

An A-B-C course in judging Rhode Island Reds. (In five lessons.)

How Rhode Island Reds originated. Mating Rhode Island Reds for Color and Shape.

How to obtain fast growth and large size on Rhode Island Reds.

How to breed up an egg laying strain.

How to cull Rhode Island Reds.

How to prepare Rhode Island Reds for the show room.

Which is the correct Rhode Island Red color.

Disqualifications.

Standard weights.

Feeding Poultry at all ages.

Linebreeding

How to treat sick fowls.

How to get rid of lice and mites.

How to build poultry houses and equipment.

Special Illustrated Features are the following

A picture of Rhode Island Reds in natural colors, suitable for framing, the last set and best ever published, copyrighted 1919. Pictures of many prize winning Reds at National Shows—Description of a common sense window for fresh air poultry houses and detailed illustrations made from blue prints.—How to build a practical poultry house for a small flock of chickens. How to make a good homemade trapnest.

There are many other articles of unusual interest and value in "Blue Ribbon Reds." You will have to see a copy of this great book in order to appreciate it. It is a veritable encyclopedia of useful poultry information, produced at a cost of \$3,000.

THIS remarkable book will be sent free with a three year subscription to the RHODE ISLAND RED JOURNAL at \$1.00, if you clip this ad and send it with your name and address.

...THE...

Rhode Island Red Journal

is the official organ of the Rhode Island Red Club of America, published monthly, at 50c per year. It is the "Red Breeders' Bible," and those who know it say they would not be without it for \$5 per year. It keeps you in touch with all the leading breeders of Reds and keeps you posted on everything pertaining to Rhode Island Reds.

Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high price food to lousy chickens. It's a dead loss—don't do it. Use "LICECIL." No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang uncorked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Licecil vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54, Quincy, Illinois.

EGGS

70% Water

HEAVY DRINKERS ARE HEAVY LAYERS:—

Each hen must drink one-quarter pint water every day to produce high priced winter eggs. **Water must be warm.** Hen's temperature 100 degrees F. Don't let your hens drink ice cold water a single day this winter for it will chill to the bone and **may stop egg production whole month.** Why permit unnecessary loss when the

Eureka Sanitary Fountain KEEPS WATER WARM 24 HOURS

No lamp, no fire, no danger. No upkeep. No trouble. **Only up-to-date Sanitary Fountain.** Drinking cup does not project beyond outer can. No possible chance to catch litter or filth. No contamination. Water, always warm, clean and pure.

Made of heavy galvanized iron. Built like fireless cooker. Works like thermos bottle. Simply fill every evening with hot water—that's all. Hens will have plenty of pure, clean, warm water early in the morning just when they want it and need it most.

Water is a natural tonic just as important as feed. Get full value from high priced feeds. Increase egg production and profits by keeping warm water before your hens all the time.

The heavy drinkers are the heavy layers. 100 layers will drink 12 to 15 quarts of water a day. Keep warm water before the hens continuously so they can drink all they want and all they need. **The water must be as nearly clean and pure and fresh at all times as the water you drink yourself.** This cannot be done with open containers. The Eureka Sanitary Fountain is not a luxury. It is a necessity—a year round fountain. It keeps warm water warm in winter and cold water cool in summer.

Made in Three Sizes, as Follows:

2 gallon size, 15½ ins. high; 13 ins. diameter; 15 lbs. weight.

Price, each.....\$3.75

3 gallon size, 18 ins. high; 14 ins. diameter; 20 lbs. weight.

Price, each.....\$4.25

5 gallon size, 22 ins. high; 15 ins. diameter; 30 lbs. weight.

Price, each.....\$5.50

Money Back Trial Offer

You can't afford to be without the "Eureka." It pays for itself in 30 days. Lasts years. Thousands of satisfied users. Order today for you take no risk—no chance whatever. If you are not absolutely satisfied that it's the best fountain you ever saw or used, or if you are not entirely satisfied in every way, you get your money back. **Order direct from this ad today. Don't put it off.** It means greater profit to you, more eggs than ever before and a healthy, happy money-making flock. **Order at once—NOW.**

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

Feed for the Winter Layers.

First Prize Article.

Whatever success we have had in getting winter eggs has been due to making a careful study of the needs of our flock during the cold months, and then supplying those needs as nearly as we could. One of the most important needs is a properly balanced feed. Feeding systems come and go, but there is no single system, as far as we have observed, that can be relied upon for all times and all places. Rather we must use common sense and, through our experience develop our own plan, or system, of feeding.

Some of the things that we have learned at Riverview Farm, and which we proved would produce results in eggs through some of the coldest weather of several winters, may be of some help to others.

One thing that we have found almost indispensable in feeding for winter eggs is bran. As a part of the daily ration of our laying flocks it has probably given better results than anything else we have ever used, with the possible exception of alfalfa. When the temperature drops down to ten or twelve above zero the hens need a food that will digest quickly in addition to having a high nutritive value, and these qualities are combined in bran. As a rule we feed it as a warm mash, mixing the bran with corn meal and ground alfalfa leaves.

Three parts of bran and one of corn meal are mixed dry; then boiling water is poured over alfalfa leaves and allowed to stand for a few minutes. Bran, meal and alfalfa are then mixed to form a crumbly mass, which is fed warm.

Eight pounds of this mixture is sufficient for fifty hens at the morning feed. It will not fully satisfy them, nor is it intended to. But it warms them up quickly so they can more readily withstand the cold.

After this mash is fed a quantity of wheat or cracked corn is scattered in the litter on the scratching shed floor, and this keeps the hens scratching instead of loafing. Occasionally the corn and wheat diet is varied by feeding some sunflower seed, millet, kaffir corn or any other grain of which we have a surplus, but always the bulk of the grain feed is corn and wheat, and is always fed so that the hens will have to work for it.

Before we knew better we used to buy wheat screenings in the belief that it was a cheap feed. Experience taught, however, that the screenings were made up largely of shriveled, imperfect grains and weed seeds and that the nutritive value was very low. It was really cheaper to buy good sound wheat, even at a rather high price.

About the only green feed some flocks get during the winter is what they can pick up around the barn in the form of alfalfa or clover shreds. Of course this supplies their needs to some extent but

Dark Brown Leghorn prize hen at Heart of America Show. Owned by Geo. L. Russell, Box 72, Chilhowee, Mo.

Oat Sprouters

Now is the time to begin feeding sprouted oats for the best results.

Statistics show that sprouted oats fed to laying fowls increase egg production about 100%.

Made in both Sun-Lite and Lamp-heated styles and in different sizes. Send for descriptive circular.

HAROLD TOMPKINS' RHODE ISLAND REDS

Single and Rose Combs

Fancy and Utility Birds

For years this famous strain has demonstrated its superiority. The matchless winnings made in 1921 at the great Red Meets held at Boston and Rochester prove that my birds possess the very latest present day requirements for Standard Rhode Island Reds, and are unexcelled as Prize Winners.

Show Birds

Boston, December, 1920; January, 1921.

From my large number of different styles of birds linked with my years of experience I can select just the kind that will help you win. These birds possess such a striking resemblance to my famous winners that their popularity is assured in the show room.

BREEDING BIRDS

If you want to produce Rhode Island Reds that will win and lay for you, order breeding stock from this famous strain of producers.

Utility Birds

Early hatched cockerels and pullets that will improve your color and egg production. No matter what your wants may be I can take care of them satisfactorily. Order at once.

Rochester, January, 1921.

Wipe Out Every Rat and Mouse

Amazing New Discovery Quickly Gets Every One. Not a Poison.

Don't be satisfied with trapping or poisoning just a few. Exterminate the whole bunch—old, young, big and little. Rats do millions of dollars' damage each year. They kill chickens, destroy grain, damage buildings, merchandise, and are filthy disease carriers.

A wonderful new scientific discovery called Imperial Virus now enables you to clear your place of every rat on it. The amazing feature of it is that it is not a poison and affects rodents such as Rats, Mice, Gophers, etc., only. It is perfectly harmless to humans, stock, poultry, pets. It can, therefore, be spread anywhere knowing it will kill only the pests you want to get. One rat affects the others and in a short time the whole colony is exterminated, root and branch. They die outside, too, hunting air and water.

You Can Try It FREE

The manufacturers of this amazing Virus, to get it quickly established and widely used, are making a Special Guaranteed Introductory Offer of two regular, big, full sized (double strength) \$1.00 bottles, for the price of one. Use one yourself and sell the other to a neighbor, thus getting yours free. They will also tell you how you can make money telling your friends about it. As this offer may not appear again, you should act at once or clip for future reference.

You need send no money; just your name and address to the Imperial Laboratories, Room 231, 2110 Grand Avenue, Kansas City, Mo., and pay the postman \$1.00 and a few cents postage, when the two bottles arrive. It costs you nothing if it does not do the work, as they positively guarantee to refund your \$1.00 any time after 30 days if you are not satisfied.

Wanted Experienced Poultryman

A splendid opportunity is open for an experienced poultryman for special work with a big mill making a widely advertised line of poultry feeds. The man for this position must be of the successful substantial type with a bank account to prove his ability and success. Nominal investment required with guaranteed returns. You will have your choice of location and you will be an important factor in the organization. In replying give full particulars, age, present and past work. Selling experience not really essential. Address in confidence, Box 100, care of American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

BECKERS' ANCONAS

ARE HIGH PRODUCERS.

BECKERS' ANCONA YARDS, Route 3, Vineland, New Jersey

not nearly so well as vegetables. Alfalfa leaves make one of the best substitutes for the hen's natural green feed, but to get best results the leaves should be steamed.

We have found it advisable to feed a variety of vegetables in addition to the alfalfa-bran-meal mash. We make it a point to store a quantity of beets, carrots, turnips and cabbage in the fall for the especial use of the poultry during the winter months. Then, in addition, we always have more or less lettuce, spinach and sugar beets, as well as some small potatoes to feed the chickens. And it certainly shows in increased egg production.

In feeding the vegetables we usually cook them well, mash them up and mix with bran and meal. It will not do to feed them this way in large quantities, but they are very beneficial if fed once a week in this manner. Then we usually have several heads of cabbage or some beets hanging where the hens can pick at them at will.

Meat scrap also is a part of the daily ration of our hens. Dried meat scraps fed several times a week in small quantities take the place of the bugs and worms that the hens get in summer, and they give good results. Green bone, too, is excellent, but we get along very well without it most of the time. If it is convenient to obtain, a small quantity fed three times a week will give good results.

During very cold weather we find it pays to warm the feed. It may mean a little extra work, but we have found it also means more eggs, and that is what counts. A good supply of grit and crushed shell ought to be on hand at all times; also clean water that is not too cold.

The digestive apparatus of a hen gets out of order just the same as the digestive apparatus of a human being, so if we want eggs we must see that our egg machines, the hens, are kept in perfect running order. We have found that it pays big, and our well-filled egg baskets are the proof.

Ohio.

Nat S. Green.

The Modern Hen House.

Second Prize Article.

In building a poultry house, first get a good foundation. For this there is nothing better than concrete. Dig down and get good drainage by putting in a ditch and fill it with large stones. Then make a wall at least a few inches high so as to keep the wooden part of the house above the ground. I have used concrete blocks for this wall, putting one course of eight-inch blocks in front and three or four on the ends and the back side.

Where these blocks are used on the north side they may well be built up as far as the plate, and they make a warm and windproof wall. Put in a concrete floor to keep rats out, even if you intend to cover it with dirt later. It is well to have this floor, because it will make the building dryer and it is well worth its cost to prevent rats from getting into the house.

I find that a house about 14 feet wide is as wide as the sun will shine back into, and with this width the house can be made as long as wanted. Make the back plate at least five feet high above the floor, and the front one

NEW LAMP BURNS 94% AIR

BEATS ELECTRIC OR GAS

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94 per cent air and 6 per cent common kerosene (coal oil).

The inventor, F. T. Johnson, 609 W. Lake St., Chicago, Ill., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.—Advertisement.

STOPS PREVENTS ROUP

SID SMITH SAYS: Last year my O. D. Mitchell's Roup Germicide was used on high priced poultry at the big Chicago Coliseum and Stockyards Poultry Shows where it saved the lives of valuable prize winning birds. That's proof it ought to be good enough for you, isn't it? I want to prove to you that it's the very best preventive and cure for Colds, Roup and Cholera you ever used. Use it as a preventive and keep your flock well. No matter how bad your chickens may be, I positively will guarantee a cure. 3 sizes: 50c, \$1.00, or \$3.00, postpaid.

two feet higher. This roof is too flat for shingles, so use a good grade of roll roofing. The roof boards should be matched, although comparatively rough lumber can be used. For the sills and frames use 2x4's. A 16-foot stick will make a rafter, and will not need cutting. It is better to put a plate through the middle lengthwise and put in one or two posts to hold this and the roof up.

You may make the foundation of solid concrete, if you wish, by simply setting a board up on edge and driving stakes in to hold it till the concrete sets. Put a few bolts in the wall to hold the sills. It is well to have nuts on these bolts, so that the entire building can be anchored to the ground.

If the sills must be spliced, simply spike a piece some four feet long over the joint, and for the plates put the piece under the joint. Of course, the studs will be shorter where these pieces are. Set the studs two feet apart, except at the sides of doors and windows. Have the windows full length—that is, the same as house windows, so that they can be raised.

For the sides you can use matched boards or coping; but I prefer to board them up with either rough or planed and matched stuff horizontally and then shingle the sides. This will cost a little more, but if you have used concrete for most or all of the back and parts of the ends, there will not be much in the way of sidewalls to be covered with lumber, as the doors and windows will take up a good share of the front. The shingles may be placed six inches to the weather and one thousand of them will cover 150 square feet of siding. If a good paper is put under them the wall will be tight.

In a house 30 feet long put a partition through the center, and some five feet each side of this put in a half partition from the back, so as to make a roosting room. In our climate this is advisable. We also have a curtain hung from the center plate so it can be let down in front of the roosts on cold nights. This means that the roosts are in the warmest part of the house and does away with frosted combs. The roost room may be ceiled overhead and also on the back side if desired.

MEAT SCRAPS

Triple Egg Yield

In a two-year feeding test by Purdue University it was shown that 30 birds fed meat scraps in the ration averaged 179 eggs per year; while 30 birds fed exactly the same ration but without meat scraps averaged only 59.35 eggs per year. It was further shown that the presence of meat scraps in the ration increased the efficiency of the other feeds and that every 100 lbs. of meat scraps fed produced \$52.57 worth of eggs (average price of eggs, 46c a doz.)

Test shows that Meat Scraps are cheap at 6c a pound as compared with no meat scraps.

Figure Your Profit

These figures speak for themselves. Figure the profit that you can make feeding MEAT SCRAPS to your fowls. You can't neglect this valuable and economical source of animal protein. Government authorities say that meat scrap is the one essential constituent of the mash which cannot well be omitted. The more your hens will eat, the more they can lay. Insist on

THE G. E. CONKEY CO. 6531 Broadway, Cleveland, Ohio

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.

OF AMERICAN POULTRY JOURNAL, published monthly, at Chicago, Illinois, for October 1, 1921.

State of Illinois, County of Cook, ss.

Before me, a Notary Public, in and for the State and county aforesaid, personally appeared James W. Bell, who, having been duly sworn according to law, deposes and says that he is the Editor of the AMERICAN POULTRY JOURNAL, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—James W. Bell & Co., 523 Plymouth Court, Chicago, Ill.

Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Managing Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Business Manager—James W. Bell, 523 Plymouth Court, Chicago, Ill.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)

James W. Bell, 523 Plymouth Court, Chicago, Ill.

H. M. Bell, Congress Park, Ill.

Henry G. Eisert, 523 Plymouth Court, Chicago, Ill.

B. M. Eisert, 4040 Broadway, Chicago, Ill.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state).—None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is —. (This information is required from daily publications only.)

JAMES W. BELL,

Editor.

Sworn to and subscribed before me this thirtieth day of September, 1921.

(SEAL) ALICE A. SHEHAN,

Notary Public.

Win \$2,000

Answer
This
Puzzle

Bank Guarantee

State Bank of Philadelphia
PHILADELPHIA, PA.

TO WHOM IT MAY CONCERN:

Mr. E. J. Reefer has deposited \$10,000.00 with this bank as a guarantee that he will pay all the prizes awarded by the judges to the winners of this puzzle contest. This bank guarantees Mr. Reefer will do as he agrees.

STATE BANK OF PHILADELPHIA

E. J. Reefer
Cashier.

How many objects beginning with "L"
can you find in this picture?

Open to Everybody

A GREAT big bona-fide chance to win \$2,000 and 14 other Cash Prizes. Think of what you could do with \$2,000 this very minute. Some one will win it! You have the same chance! How simple! Try your skill NOW!

Mail at once the names of all the objects you can find in the picture beginning with "L". It costs nothing to try. To the one sending in the largest and nearest correct list of names the first prize will be awarded. To the one sending in the second largest and nearest correct list the second prize will be awarded, etc. In case of tie for any prize offered, the full amount of such prize will be awarded to each tying contestant.

names the first prize will be awarded. To the one sending in the second largest and nearest correct list the second prize will be awarded, etc. In case of tie for any prize offered, the full amount of such prize will be awarded to each tying contestant.

Costs Nothing to Try

Read the great simplicity of this offer. All you need to do is to look over the objects in the puzzle picture. Get everyone to help you. Get the whole family around. Write out every object beginning with "L", such as Limousine, Lock, etc. Nothing hidden—no need to turn the picture upside down. If the judges decide that your list is nearest correct list—the first prize of \$40.00 will be awarded to you even though you do not send an order for "MORE EGGS". But we are giving you a chance to win far more than \$40.

Win \$2,000

Will you win \$40 or \$2,000? If you are awarded first prize and have ordered no "MORE EGGS" you win \$40. If you purchased \$5.00 worth of "MORE EGGS", the same list wins \$2,000. Which prize do you want?

Get Busy NOW!

Send in your list at once. Send your "MORE EGGS" order at the same time. Qualify for Big Cash Prizes.

E. J. Reefer Dept. 6028
19th and Spruce Streets, Philadelphia, Pa.

THE PRIZES

Winning Answers will receive Prizes as Follows:

	If No "More Eggs" is ordered	If \$1 Worth of "More Eggs" is Ordered	If \$2 Worth of "More Eggs" is Ordered	If \$5 Worth of "More Eggs" is Ordered
1st Prize....	\$40.00	\$300.00	\$600.00	\$2,000.00
2nd Prize....	20.00	150.00	300.00	1,000.00
3rd Prize....	10.00	75.00	150.00	500.00
4th Prize....	10.00	50.00	100.00	250.00
5th Prize....	10.00	30.00	60.00	150.00
6th Prize....	6.00	20.00	40.00	100.00
7th Prize....	6.00	15.00	30.00	80.00
8th Prize....	6.00	10.00	20.00	60.00
9th Prize....	4.00	10.00	20.00	40.00
10th to 15th	4.00	10.00	20.00	40.00

(In the event of ties, duplicate prizes will be given.)

Observe These Rules:

- Any man, woman, girl, or boy living in America but residing outside of Philadelphia, who is not an employee or relative of an employee of E. J. Reefer may submit an answer. It costs nothing to try.
- All answers must be mailed by post office closing time, Dec. 10, 1921.
- All lists of names should be written on one side of the paper only and numbered numerically such as 1, 2, 3. Write your full name and address on each page in the upper right hand corner. If you desire to write anything else, use a separate sheet.
- Only such words as appear in the English dictionary will be counted. Do not use obsolete words. Where the plural is used the singular cannot be counted and vice-versa.
- Words of the same spelling can be used only once, even though used to designate different objects or articles, or parts of objects or articles. An object or article can be named only once.
- Do not use compound words, nor any words formed by the combination of two or more complete English words, where each word in itself is an object.
- The answer having the largest and nearest correct list of names of visible objects and articles shown in the picture that begin with the letter "L" will be awarded first prize, etc. Neatness, style, or handwriting have no bearing upon deciding the winner.
- Candidates may co-operate in answering the puzzle, but only one prize will be awarded to any one household; nor will prizes be awarded to more than one of any group outside of the family where two or more have been working together.
- There will be three independent judges, having no connection with E. J. Reefer, who will judge the answers submitted and award the prizes at the end of the contest, and participants agree to accept the decision of the judges as final and conclusive.
- All answers will receive the same consideration regardless of whether or not an order for Reefer's "More Eggs" is sent.
- The announcement of the prize winners and the list of words will be printed at the close of the contest and a copy mailed to every person sending an order for "More Eggs".

Special Offer on "More Eggs" During This Puzzle Contest
2 One Dollar Packages for \$1.00.
3 One Dollar Packages for \$2.00.
Economy Size Package for \$5.00.
(The Economy Size package contains 20 times as much as the \$1.00 size package)
No goods bought during this puzzle contest are subject to exchange, refund or approval.

30 Prizes Out of 30 Offered

Sweepstakes Championship Male and Female and Every Special Prize—every bird bred on my farm.

This amazing record is an exact duplicate of the Imperial "Ringlet" record of 1920 at Madison Square Garden.

These 100% Perfect Records are the crowning achievement of the unexampled "Ringlet" Records at New York for more than 30 victorious years.

The competition at this show was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

Supreme at Madison Square Garden Is Supreme Everywhere

GRAND WINNING SHOW BIRDS

The finest that all America has ever produced are now on my farm ready to win Blue Ribbons and Silver Cups for you in any competition in the world, in Cocks, Cockerels, Hens, Pullets and Pens. Their matchless "Ringlet" barring wins under all judges. **As layers they stand pre-eminent.**

PRIZES AND SILVER CUPS

have been won by my customers on the Imperial "Ringlets" in thousands of showrooms throughout the civilized world—you can win the same laurels. I will sell you grand exhibition birds for any show, and breeders of this richest First Prize Sweepstakes New York Blood in elegant single birds, trios or pens, mated to produce Prize Winners.

**If you want the best, you must have my Imperial "Ringlets"—
they are the standard for all the Barred Rocks in all America**

Elegant catalog mailed upon request

EGGS From the finest exhibition matings in the world. One setting \$20, two settings \$35, four settings \$60, 100 eggs \$90

AMERICAN POULTRY JOURNAL

VOL. 52

DECEMBER, 1921

NO. 12

15c
Per Copy

Entered as Second-Class Matter August 9, 1886, at the Postoffice at Chicago, Ill., under the Act of March 3, 1879. Published by Jas. W. Bell & Co., 523 Plymouth Court, Chicago, Illinois. Subscription Price, 75c for 1 year; \$1 for 2 years. \$2 for 5 years.

The Apple Trees that Made \$1²⁵ Land Worth \$1500⁰⁰ an Acre!

Hon. Franklin K. Lane, late Secretary of the Interior, wrote:—

"Land in the Columbia Basin that I could have bought for \$1.25 an acre . . . They have taken the Delicious apple, cared for it, until now it makes that land worth \$1,500.00 to \$2,000.00 per acre."

The apple trees that helped Buck Bros. of Elber-

field, Ind., get \$50,000.00 for one crop last year from 40 acres of apple trees.

—the apple trees that brought Ed Mollatt of Port Murray, N. J., \$12.00 per barrel, while Baldwins sold for \$2.50 to \$3 per barrel.

—the trees that the Horticultural Dept. of this very paper, the American Poultry Journal, has rightfully recommended to thousands who wanted to combine fruit raising with poultry raising.

Five Boxes Stark Delicious From a Stark Delicious tree 3 years after planting—J. D. Bashor.

STARK DELICIOUS

Smashing All Crop Records Again This Year!

Big Crops Despite Frosts and Freezes

In many sections, Stark Delicious was the only variety to bear crops this past season. For instance, the Louisville Eve Post states: "Chas. Schindler, extensive fruit grower, Floyd Co., Ind., stated yesterday that half his apple crop was saved, the variety saved being Stark Delicious alone. He believes that this variety is the one to withstand the late frosts which occurred in Indiana." In our test orchards, both Stark Delicious and Stark's Golden Delicious bore, despite 3 frosts and 2 freezes this year.

Trees that have 3
Sets Blooms—Defy Frosts

STARK'S GOLDEN DELICIOUS

The remarkable habit of these trees of putting forth not only the ordinary fruit spur blooms, but also lateral bloom-buds and terminal bloom-buds makes it a frost-dodger. We had bumper crops on our Stark's Golden Delicious this year—and so had other growers in Mo., Ky., Iowa, Ala., Calif., Ark., Mass., Ohio, Ill., Wash., Ore., etc. Write at once for Free Copy of Our BIG "Prize Fruits" Book—FREE!

the egg yield will always be increased. This increase is not due to drugs or stimulants that soon destroy the hens, but is the result of the vitalizing, energizing, living sprouts that contain in their nascent state the food elements, not medicines, that the hen needs to form eggs. Sprouted Oats also conduce to a high degree of egg fertility. Young chicks fed germinated grains—starch changed to vegetable milk and grape sugar, make rapid growth and are less subject to disease. Hence the best investment you can make in the poultry line—an investment that pays a dividend every month in the twelve, is a

SPROUTED OATS

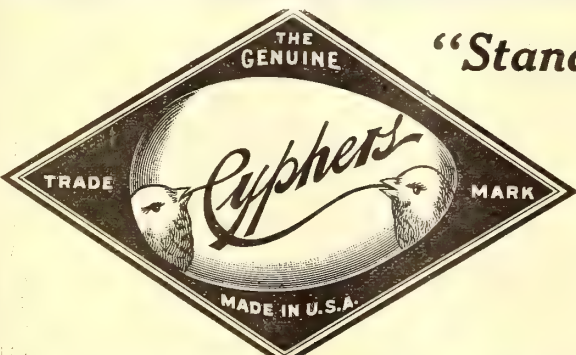

EGGS

SPROUTED OATS, or wheat, rye or barley, are now generally accepted as pre-eminently an egg producing feed. It matters not on what ration the hens are fed or how well they may be laying, if fed also the sprouted grains the egg yield will always be increased. This increase is not due to drugs or stimulants that soon destroy the hens, but is the result of the vitalizing, energizing, living sprouts that contain in their nascent state the food elements, not medicines, that the hen needs to form eggs. Sprouted Oats also conduce to a high degree of egg fertility. Young chicks fed germinated grains—starch changed to vegetable milk and grape sugar, make rapid growth and are less subject to disease. Hence the best investment you can make in the poultry line—an investment that pays a dividend every month in the twelve, is a

CLOSE-TO-NATURE VAPOR-BATH GRAIN SPROUTER

Our sprouters produce the succulent, vapor-bath sprouts with their vegetable milk, grape sugar, and other easily assimilated ingredients so essential to egg production. They cut down the feed bill and run up the egg yield. From 1 bushel of grain they make 2 to 4 bushels of the very best of egg-producing green feed. They germinate grain in 20 to 30 hours and force growths of an inch or more daily. The Grain Sprouter business was originated by the CLOSE-TO-NATURE Company, Mr. W. H. Monroe, its manager, invented and put on the market the first, the original sprouter a dozen years ago and is still at the business. Hence we are the oldest and also the largest manufacturers of sprouters in this country. We know how to make an efficient and practical sprouting machine. We make all kinds to suit all conditions and climates, and many sizes from 1-4 bu. to 8 bu.; for a few hens or a 1000. GET OUR CIRCULARS GIVING FULL INFORMATION ON SPROUTED OATS AND EGGS.

BYERS' ORPINGTONS

At Chicago Coliseum past 34 months—75 of my Orpingtons stood under First Prize Ribbons (all my competitors combined only showed 16 birds under First Prize Ribbons); and in Buffs last winter I showed 11 birds under First Prize Ribbons while all my competitors combined only showed 3 Buffs under First Prize Ribbons. 172 of my Orpingtons stood under Ribbons. I won 13 out of a possible 14 Firsts on Pens and have never lost Special for Best Display in Buffs, in Whites or in Blacks at this Premier Exhibition—Chicago Coliseum, past 34 months.

If you would own this kind, buy into the Strain that produces them.

Byers' Orpingtons Stand Supreme

and have become the Standard Strain of all America. Twenty years of continuous, constructive breeding; my late unparalleled Winnings at the great Chicago Coliseum Shows and my square deal policy in every transaction, unfolds the reason.

If you will take the trouble to examine the leading poultry journals of the past 15 years you will find Byers' Orpingtons advertised by the writer. For years I have endeavored to convey to you the double importance of my continuous, constructive, successful, permanent Orpington breeding as an exclusive business without interruption or intermission. When you appreciate that feature and buy accordingly you will succeed. It means everything to you as a purchaser of permanently dependable stock.

From My Champions

this season I have bred the finest line of 1921 early show Winners ever offered. Come to my plant for an interview or a purchase or place your order by letter which insures exactly the same maximum value as your personal selection would afford, subject always to your approval or refund of your money.

PRICES

Birds of rare standard excellence capable of winning this month at state shows: Cocks and cockerels, \$50 each; hens and pullets, \$25 each; old or young pens (4 females and male), \$125. Birds to win at less important shows half the above prices: Big breeding cockerels, \$10 each; two for \$18; four for \$32. (These big fellows would improve 80 percent of the flocks of America.) **Buy from a real Orpington breeding establishment. It's cheaper by far.**

NOTE—I have a few outstanding superb Stars in Buff, in White and in Black Cocks, Hens, Cockerels and Pullets to win the Blue and Silver Cups at the largest December and January National Shows of the Nation. They are the finest Orpingtons that all America has ever produced. Their matchless type and color will win under all judges. Their purchase eliminates failure. Prices on application. Wire if necessary.

C. S. BYERS [THE BEST BREED Bred Right 20 Years] **HAZELRIGG, IND.**

INDEX TO GUARANTEED ADVERTISERS

The guarantee of James W. Bell & Co. is back of every advertisement and every advertiser in American Poultry Journal. We will not knowingly accept advertising from a dishonest concern. Advertisements for patent medicines or mining schemes, or any other questionable advertising, are not accepted under any conditions. We will not knowingly introduce a dishonest advertiser into the home of one of our subscribers. We refuse many thousands of dollars' worth of advertising during the year because we are not willing to guarantee these advertisers to our subscribers. When answering advertisements mention American Poultry Journal and refer to this guarantee.

1st Hen Madison Square Garden, 1919

Wilburtha White Leghorns

Have been big winners in our largest exhibitions for years. Note our winnings this Fall at two big shows:

NEW YORK STATE FAIR—SYRACUSE, N. Y.

1 Cock, 2 Hen, 1-5 Cockerel, 4 Pullet, 3 Young Pen, 5 Old Pen.

NEW JERSEY STATE FAIR—TRENTON, N. J.

1-3 Cock, 1-2 Cockerel, 1-2 Pullet, 1 Old Pen, 1 Young Pen.

If you Need quality Leghorns, write us. We have them.

Bronze Turkeys

VIGOROUS BREEDERS
...GREAT WINNERS...

Partridge Rocks

AT MADISON SQUARE GARDEN, 1921—On Bronze Turkeys we won: 1-4-5 Cock, 1-2-4-5 Hen; 1-2-3-4-5 Cockerel; 1-2-3-4-5 Pullet. On Partridge Rocks we won: 1-2-3-4-5 Cock; 2-3-5 Hen; 1-4 Cockerel; 1-3-4 Pullet; 1 Young Pen; 1 Old Pen. Exhibition and Breeding Stock for Sale. Write for prices and catalog.

BIRD BROS, Box C, MEYERSDALE, PA.

The Schwalge Sectional Incubator

Our FOUR IN ONE has gained a reputation as the most practical incubator for any poultryman—large or small. It is a BABY MAMMOTH. Has FOUR independent egg chambers IN ONE and heated with one heater. A hatch can be taken off every week, if desired.

"Four In One" 800-Egg Section

To this FOUR IN ONE additional sections can be added within a few minutes. Can be enlarged to 9,600 egg capacity. Will hatch duck and goose eggs as well as hen eggs. Shipped with legs removed and will easily go through 2-ft. door sideways.

EACH EGG CHAMBER IS A SEPARATE UNIT, holding 200 eggs—in two egg trays for convenient handling. Trays may be arranged for PEDIGREE HATCHING, if desired. Any chamber not in use may be shut off by means of a stop-off damper, thus saving oil.

PURE RADIATION HEAT. The heat travels through 4 inch heating tubes, giving a large heating surface and causing a mild heat. Positively no bad air can enter the egg chamber through these tubes.

MOST UNIFORM TEMPERATURE. The heat to the different chambers is controlled before it reaches the chamber (not afterward), which insures the most uniform temperature to all egg chambers.

EFFICIENT VENTILATION SYSTEM, independent of heating arrangement and easily regulated. Makes the chicks strong and healthy.

MOISTURE GENERATOR for dry climates or high altitudes. Water is dropped on hot tube inside the egg chamber and evaporates.

HIGH-GRADE CONSTRUCTION. Sound lumber, 28 gauge galvanized iron and a liberal amount of fire-proof asbestos is used in the construction of the Schwalge Machine. Packed well to hold the temperature very steady.

ALL PRICES REDUCED TO ROCK BOTTOM YET THE QUALITY REMAINS THE SAME AS BEFORE

9600-Egg Machine (12 "Four In One" Sections)

We give the most far-reaching guarantee that any responsible firm is able to give on their product.

Owen Farms

Single Comb Rhode Island
Reds and Buff Orpingtons

Stand Pre-eminent

Their outstanding leadership has been established by crashing victories at Madison Square Garden, New York; Boston; Chicago; Kansas City; Pittsburgh; Syracuse; and nearly all the other shows on the continent. A complete list of their winnings would be a nearly complete index of all poultry shows.

1921 REDS

are wonderful in their uniformity of type and color. Perfect health and vitality, with plenty of size and bone are possessed by every cockerel and pullet. Raised on free range and bred for egg capacity. If you want Reds that are even, velvety dark color, have wide backs and wide spread tails you will find them here. My entire flock have exceptionally good combs, red eyes and strong black markings.

1921 BUFFS

are the smooth, soft, even golden buff color with sound wings and tails that have done so much for the leading Buff flocks in the country and held the supremacy of the Owen Farms Buffs for sixteen years. Real Orpington type without exaggeration of feathering, yet massive and the type that lays early and often. If you want real lasting color combined with real Orpington type, you will find them here.

1921 PRICES

All ordinary cockerels have been marketed. Only really promising birds have been matured under free range conditions. Good breeding cockerels at \$10.00 and \$15.00 each; choice breeders and good show birds at \$25.00; \$35.00 and \$50.00 each. A few exceptional cockerels for the hottest shows at prices you will gladly pay. Pullets—good breeders at \$7.50 and \$10.00 each; choice breeding and show pullets at \$15.00; \$25.00 and \$35.00 each. A few wonderful show pullets at higher prices. A few choice cocks and hens a matter for correspondence.

Send me the amount you wish to invest. Tell me exactly what you wish to accomplish. If you are showing, name your show. I will personally select your birds for you and mate them as carefully as I do my own pens. Your permanent lasting satisfaction and success is my aim.

VISITORS

are always welcome. Have never known one to be disappointed with what they found here. They are a unit in saying they "Never expected to find such quality in such quantity." Come and see for yourself if you can. If not, come to me on paper. Will try and help you in any way in my power and am interested in all your plans for bettering your birds. An order for utility birds will have the same careful handling as for high priced show birds. Try Owen Farms and see what Golden Rule treatment means when applied to the poultry business.

Hens that Shell Out the Eggs in Confinement

Much Has Been Said on the Advantages of Range—Back-Lotters Can Succeed With Decidedly Intensive Methods—Induced Exercise Is the Solution of Successfully Handling Fowls in Confinement.

By C. E. Ashbrook

IT IS a most forgetful poultry writer who fails to give somewhere between his opening and closing paragraphs, one more boost to free range, particularly for growing stock. The constant ding-donging of range, range, range, on the eardrums of those who aspire to poultry keeping, is indeed a funeral dirge to the hopes of the aspirant who lacks the free range acres. And said aspirant invariably does lack this very thing.

Nature offers range for exercise, under those healthful conditions when nature is not too wet, too dry, too windy or too this-that-or-the-other. The jungle fowl enjoys all these rigors of nature. Our improved domesticated fowls may have exercise without range, so I say to you who want to get into the chicken business: If you haven't got the range, so much the better; your taxes will be less.

Look at the gent above who is on free range. He balances his ration at kitchen doors and roosts in a well ventilated haystack. He is a brother of the great out-of-doors, yet he is a non-producer.

Rhody Red, shown at the left, has a whole ten acres to range on. When protein in the form of worms and bugs, is scarce, Rhody runs her yellow legs off. Just at present she is unbalancing her ration at a most alarming rate. She, too, is a non-producer.

The less there is to eat, the harder the range fowl works to get it and vice versa. That's all wrong. There should be a better relation of feed to exercise; more sustenance in response to work on the part of the hen.

Look at the gent humped over a city desk and the bird in a back-lot park. "Ah ha!" say the free range chorus, "victims of the intensive plan." No, just victims of a sedentary life. The gent needs exercise to become physically fit, and if he were then of a good strain, he could promote himself to a better job and become a good producer.

If the bird resting on the tin can could take regular runs in the two by six run-way, built for that purpose, (but unfortunately used as a repository for tin cans and so on), she might shell out enough eggs to entitle her to a place in a laying contest, or to have her por-

trait reproduced in American Poultry Journal, provided also that she is of a good strain.

The last pair here shown are high producers and live very much on the intensive plan, but the system is right. One lives in a steen-story up-town apartment house and has his own office in a steen-story down-town office building. He is an enthusiastic member of an athletic club and keeps himself in the pink of condition by eating properly, breathing fresh air and taking exercise at home. The bird rivals the gent in well balanced rations and proper exercise. She, an Ancona (yes, the writer keeps that kind, of course) with twenty-four room-mates, lives in an eight by ten open-front house. She breathes out-door air, eats mash and grain feed; she exercises because she is healthy and she is healthy because she exercises. She exercises by scratching in a straw litter for her grain feed, and the exercise induces a hearty appetite, and a cheerful, singing attitude. She shells out eggs accordingly.

Two-thirds of the floor space in my 8x10 house is covered with a board floor. Here the birds work in deep litter for the grain fed in the evening. The remaining one-third of the floor space is a dirt scratch pen. A little grain is raked into the dirt in the evening. In the morning, the birds make the dirt fly in their eager search for the buried grain. In the forenoon the mash hopper is opened.

Sprouted oats are fed at noon. No matter what the weather conditions may be, the dirt pen is always a busy spot. If it is higher than the ground level, it will not be too damp during rainy weather. An occasional sprinkling is necessary in dry weather, to keep the ground humid and keep down the dust.

About twice a year the dirt is hauled into the garden and an equal amount of garden soil returned to the pen. About an hour's work for a pen of twenty-five birds.

No yard is needed, though it would be a good plan to have a small general yard including all the pens, in which to turn out the fowls, when the house is being renovated.

That's all. Step up, fellow intensive poultrymen, and tell the world how you make 'em shell 'em out! Every experienced man knows that all the heavy layers are closely yarded; that many of the houses on commercial egg farms have no runs; that the secret lies in a sanitary floor, right feeding, fresh air and induced exercise. Many prize winners are products of back-lots.

THE PROFITS FROM A BACK YARD FLOCK

A pen of fifteen White Leghorns that produced an average of nearly 20 dozen eggs per bird during the year—Returned a profit of \$5 per hen over feed cost—Points of value learned in feeding.

By Alfred B. Garner.

AT THE time I was writing my article on "Handling the Back Yard Flock" and its accompanying article on "Growing Chicks in Limited Quarters," the first of which appeared in this magazine in the April issue and the latter article in the May issue, I had not the least idea as to the number of people, back lotters like myself, who were eagerly waiting for information applicable to them. When over two dozen letters came to me in reference to the first article before I had even received my copy of the April number, I was astonished. But when every mail kept piling them up until I had a grand total of over five hundred letters in reference to the first article alone, I could hardly believe the plain evidence before me. It seemed all the more remarkable when I considered the fact that my address was not given in the article and that but passing reference was made in the body of the article to my home city of Harrisburg by referring to the extremely cold weather in the laying period mentioned and the freezing of the Susquehanna river at this place.

It was some job answering all those letters, and more than I had bargained for. But on the principle that I shouldn't have written the article if I did not want to help the readers of this magazine, I finally completed the task. My experience proved very conclusively to me that a vast field of usefulness is open to the poultry publication which will devote more time and space to the interests of back lotters like myself, than has heretofore been allotted to this branch of the business. When over five hundred people will write the author of one not very carefully prepared article, and that author entirely unknown in poultrydom, and will also run the risk of the letter ever reaching him, it is very evident that a very large number of back lotters are anxious and waiting for poultry information that has never been given them before.

Experiments in Feeding.

The Editor of the American Poultry Journal, in view of the kindly reception given my other articles, kindly suggested I write a further article of interest to back lotters. Between you and I, I was going to write it without this request, but it is nice to be asked to do so—kind of stiffens up a fellow's pride. But pride or no pride, I wanted to give to the readers of this magazine the benefit of several experiments in the feeding and the care and attention of the flock I have made in the past year.

In my experience of many years with any number of back lotters I have found that but very few understand the relation of the amount and kind of feed they give the chickens, bears to the number of eggs they receive. The vast majority of them fail to understand that they cannot simply throw into the coop enough feed to keep the chickens alive and yet get eggs. And but very few of them seem to realize that there is no one kind of grain or food that contains, in itself, all the constituent materials that will make eggs. This is also generally true with most farmers. A farmer will feed all one kind of grain of which he has the greatest surplus. And yet if he would but read the poultry magazines regularly he would know that eggs have been analyzed time and again; that composition of any egg is thoroughly known; that all grains have also been so analyzed and that it has been found that no one grain contains in the proper proportion, all the necessary nutrients to make the egg. And yet most farmers go right along feeding but the one whole grain, and, of course, they fail to get the winter eggs. And if it is true of the farmers, where the chickens have the run of the barn and can get the hayseed of the barn and

the oats of the manure pile as a variety, how much more true is it in the case of a back lotter where the chickens can secure only such feed as is actually given them by the owner.

The sooner we back lotters realize that the contents of an egg is scientifically known and that neither corn, wheat, oats, nor green food, each in itself, contains what is required to make an egg, but that certain joined portions of each are required, then, and then only, will we understand that to get eggs in plenty we must feed the right food to get those eggs. With this in view I undertook certain experiments in feeding. We all know these experiments have been made before by colleges and experiment stations, but I wanted to apply them in the back yard flock where every possible condition is known and the peculiarities of each particular hen is an open book to the owner.

I had two flocks of fifteen pullets, all hatched the same day, all out of the same mating, and all raised exactly alike. For several months I compared the egg laying qualities of both pens and they had been practically the same. I had always hesitated to make such an experiment for one does not willingly wish to spoil extra good stock. But for my own satisfaction, I went ahead with it. The results to me were surprising and may be helpful to you.

What I Have Learned.

The first experiment was in feeding exactly as I had always fed and which was fully described in the April issue, with the exception that I omitted all green food. In my case it was the omitting of the feeding of sprouted oats for that constitutes my only green food with the exception of particles contained in table scraps.

Now, you back lotters, how many of you feed green food except to throw in some grass when it is handy and plentiful? How many of you expect eggs in Winter when there is no grass to feed or late in Summer when it is old and tough? Listen to what my experiment proved to me as to the results of no green food.

In the period for which I fed the one pen sprouted oats and the other pen no green food whatever, the pullets in the pen fed with the sprouted oats laid 93 eggs and the pen without any green food whatever laid 56 eggs, or, in other words, two pens that had been laying almost egg for egg for months, in a few weeks the one without the green food dropped 37 eggs, or 40 per cent. And I am satisfied that the difference would have been much greater had the experiment been continued longer. If this is true, and it is true, you can readily see why the farmer's egg yield practically stops in Winter and why your eggs become fewer and fewer in number if you do not feed green food.

Sprouted oats is such a cheap food, and a food so easily produced, it is a crime against poultrydom if you have good chickens and do not feed it. How simple it is to have all the sprouted oats you need. And now get busy.

The second experiment was in feeding grass instead of sprouted oats. I found that when the grass was young and tender in the Spring, but very little difference exists for egg laying purposes between the grass and the sprouted oats. But when it becomes older and tougher there is a difference in egg laying values of at least 9 per cent in favor of the sprouted oats. And in feeding steamed grass in the Winter that has been shade dried and kept over from the Spring, the percentage in favor of sprouted oats increases to 12 per cent. This would seem only natural when we compare them (Continued on page 1068)

DISTINCTIVE POINTS OF HAMBURGS

The "Pheasants" of the Chicken Species—Producing Elegant Specimens Reduced to a Science—A Century of Breeding Back of Present Day Birds—How to Mate—Hints on Management.

By J. Martin

SELECTION of a breed is perhaps always a matter of personal preference; therefore, my manner of language in discussing the breed of my choice will not appear too inflated when I say that of all the breeds recognized in the American Standard of Perfection there is not one, to my mind, that approaches the Hamburg for beauty and egg production.

They are in a class by themselves. Their beautiful plumage, sprightly appearance and general comportment appeals to the eye of the fancier. The casual observer, who sees Hamburgs for the first time, especially if they are good specimens, is always fascinated and delighted. There is something about them that just naturally compels admiration.

I venture to say there is no more beautiful sight than a flock of Golden or Silver Spangled Hamburgs foraging in pasture land in Spring. With all their gay plumage and good points, there is a great shortage of Hamburgs, and I think if breeders gave more attention and time to this breed, installing a little science in their mating, better birds and more of them would be the result. The Hamburg has been sadly neglected of late, and it is time something was done to infuse new life and enthusiasm into the breeders of this beautiful bird.

Here is a breed, one of the oldest in existence, gradually being relegated to the scrap heap. It is not the fault of the Hamburg but the careless and indifferent methods employed in breeding them. I am not an old breeder as breeders go, but I have spent twenty odd years with the Hamburg in its sub varieties and have found them the one best breed for me.

The Hamburg is undoubtedly of Dutch origin, but I believe the two English counties York and Lancashire claim the distinction of being the first to exhibit Spangled Hamburgs

Silver Spangled Hamburg hen on the left, and a Silver Penciled Hamburg hen on the right.

Feathers from modern Silver Spangled Hamburg male and female.

feathers being preferred. The Penciled varieties were known as Bolton Grays, Bolton Bays, Creoles and Dutch Every Day Layers. The black variety was called Black Pheasant.

A century of breeding has made possible the wonderful markings to be found on the Hamburg today, and at no other period has the Hamburg looked more attractive than it does today.

Here in the United States of America, we have a Standard of Perfection. Breeding birds to meet the requirements of this Standard necessitates great patience, skill and a knowledge of the breed, factors that are essential to breeders of practically any variety of fowl and the fundamentals of success.

Qualities of the Hamburgs.

In type the Hamburg resembles the Leghorn, possessing as they do a graceful form free from angles. In size they are slightly smaller than Leghorns, especially the Penciled varieties, while some of the better birds of the Spangled

variety compare favorably with the Leghorn. The Hamburg is of a slightly nervous temperament but becomes very docile when petted. It is active, yet intelligent.

When it comes to eggs, they are right there with the goods. They lay a pure white egg, although the eggs of the Golden are sometimes slightly tinted. They do well confined in small space, but it is advisable to give them plenty of room when available.

They are enthusiastic foragers on range, and in backyard lots should be given a run fenced in. They are active little workers and require no more than their wants demand. Plenty of fresh water, grit, shell, wholesome grain, charcoal and greens in variety are essential. Right here let me say, very little mash. Give them dry mash but not wet. Wet mash has a tendency to produce too beefy a comb and the usual (Continued on page 1079)

Silver Spangled Hamburg cockerel.

bred to a certain state of perfection. Away back in the early days the birds bred in Lancashire were commonly known as Mooneys, no doubt in deference to the round or moon-like spangles. In Yorkshire they were called Silver and Golden Pheasants and differed somewhat in markings, the half-moon or crescentic tipped

THE BEGINNER AND THE POULTRY SHOW

Advantages of Exhibiting the Birds You Have Bred and Raised.—The Poultry Show Is a Great School Room With the Older Breeders the Instructors—
Points on Fitting and Showing.

By E. H. Hoffman

ONE of the most interesting seasons of the year for all poultrymen, is the winter poultry show season, when the poultry exhibitions are being staged and the birds are exhibited in their best possible condition. It is a period that all look forward to with interest and every fancier closely watches his best birds and prepares them for entry in the winter shows. The beginner who has never exhibited, should make plans to exhibit a few of his best birds at his local show, and whether he wins or not, it will be an experience that will prove of great value to him.

The writer well remembers his first experience in showing birds. I was fifteen years of age. About four years previous I had made a start with a few S. C. White Leghorns, purchasing a half dozen pullets from one man and a cockerel from another. The price paid for these birds was nothing elaborate, but they were fair specimens and looked well in the yard. Poultry shows at that time were not as numerous as they are today and the number of poultry fanciers was also less, especially in the locality in which I lived. There were, however, two gentlemen in my town who were breeding Standard poultry and I became acquainted with them because I called at their homes frequently to see their birds.

A local fair was organized and one of the gentlemen mentioned became superintendent of the poultry department. I had never seen a poultry show and I was much surprised when the superintendent came to me and asked me to exhibit some of my White Leghorns at the fair. One can imagine how a young novice might feel when approached by a real poultryman and asked to exhibit some of his birds, especially when he had never seen a show and did not know a good bird from one that was not of high Standard quality. Being very much interested in a show where I could have an opportunity of seeing good birds of all varieties, I agreed to exhibit two pairs of my White Leghorns.

At that time all birds were entered in pairs. I carefully selected the two best cockerels and the two best pullets that I had and entered them at the fair. Imagine how proud I was when I saw that the judge had placed a second prize card on one of my coops! I thought then that if my stock was good enough to win a prize at a fair I was on the right road; but to my sorrow I learned from the judge and others that, while I had won second prize, my birds were far from being good ones and that there was much chance to improve them. The encouragement of winning a ribbon, however, had a tendency to stimulate my interest. I realized that if I intended to stay in the business I must get something better and be able to win a first prize. Accordingly I purchased a cockerel from one of the carload exhibitors and then I thought I was on the right road.

That first fair increased the interest in poultry in our community, and a few months later a meeting was called by the superintendent of the poultry department of the fair for the purpose of organizing a poultry association and holding a show the following January. I was at the meeting, filled with enthusiasm. I was the youngest fancier there but I was welcomed into the ranks and joined the organization. Then came the winter show and I exhibited as many of my White Leghorns as I could, including the cockerel that I had purchased.

All the cockerels that I had raised showed white in the face and I was advised not to show them because I was told this was a disqualification. Nevertheless, I won a few

prizes at the winter show and received a score card on every bird that I exhibited. I examined the cards, compared the birds and attempted to learn where my birds were defective and why others won over me. I asked questions of the judge and everyone with whom I came in contact. When the show was over I had learned many things that I had never known before. It was like attending school for me and the information obtained was of great value to me.

This personal experience illustrates the advantages of exhibiting at poultry shows and what can be accomplished by the amateur if he is interested and tries to gather information that will be of benefit to him in the future. It is very often the case that a beginner is timid about showing his birds in competition, but a novice never can tell the comparative

quality of his stock without putting them in competition. He should take a chance of winning. "Nothing ventured, nothing gained," holds good in the poultry business as well as elsewhere.

Those who have made a beginning with Standard stock should make arrangements to attend at least one show and let that one be the local show. Start out in a small way, selecting only a few birds that look promising and taking special care of them. Do not allow them to run in a large flock because crowding does them no good and a show bird cannot be conditioned without having special attention. Handling occasionally and occasional cooping in an exhibition coop will have a decided effect upon taming and giving poise to the birds intended for show purposes. A wild bird in the show room never has an equal chance with one that is tame and poses in its natural position when the judge looks over the class.

White fowls need more conditioning than colored birds, and a thorough washing is necessary to have them clean and in condition to show at their best. There are many exceptionally good birds in the hands of amateurs that could win in strong competition if they were only put in shape and given a chance. If in doubt about the quality, call in an experienced poultryman and he will be glad to (Continued on page 1070)

Jos. Wm. Kinghorne of the Washington show stroking a White Leghorn cockerel under his wattles. This is an effective way to coop-train a bird for exhibition purposes.

INCREASING THE WINTER EGG YIELD

There Is No More Satisfying Feeling Than That Which Takes Hold of a Man When He Sees the Egg Basket Filling Up—What to Feed—Use of Artificial Light.

Willard C. Thompson.

WINTERTIME comes 'round again! The pullets and hens are started on another year's business. December! Yet, they should be well started by this time. One need glance but a second at the market reports to realize that the cold days have brought with them a season of good prices. The chicken raiser finds in the winter months that time of the year when his eggs are worth real money. Winter eggs have always been the main object of the poultryman, a sort of motto, as it were. And this year is no exception. The forthcoming winter of 1921 demands just as many fresh eggs as has any past similar season, if not more. Every pullet that can be induced to produce a goodly number of eggs during the next two months is building up for herself a reputation as a profitable layer. Her eggs will mean twice as much now as they will later in the spring, when even the poor fowls will produce some eggs. Our immediate object is to cultivate the winter layer.

It is true that hens ordinarily do not produce eggs abundantly during the coldest weeks of winter. That is getting away from Nature, as she stimulates egg production in the spring season of warmer days, the season when she forces egg production for the primary purpose of reproducing the species. But man wants more than enough eggs with which to reproduce the flock. He wants a lot more, he wants eggs to sell for profit. However, such a reward must come after careful managing and intelligent handling of the fowls. Winter eggs are perfectly possible; that is if the fowls have been well bred and properly reared. For the present let us suppose that the laying houses are filled with pullets and hens from good stock, and are birds of strong, vigorous health at the opening of the season.

Maintaining Health.

Without strong, robust health no flock of pullets can make winter egg laying records. Egg producing birds depend a great deal upon their natural health and strength to help them in transferring raw food materials over into finished products, eggs. As these fowls go into winter quarters, then, every effort must be made to surround them with such conditions as will tend to maintain them in that vigorous health.

Keep the laying hens confined during the cold months, from November to about April. Hens with cold feet don't lay as many eggs. Hens running out in the yards during winter days lose time and don't consume enough feed to result in high egg production. Feeding and general care can be better controlled when the layers are closely confined to the houses.

The litter covering the floors of the laying houses should be deep, dry, and clean. Feeding scratch grain in deep litter is the method whereby a greater amount of exercise is induced and consequent better health built up. Rye, wheat or oat straw, to a depth of about six or eight inches, makes a splendid litter. If there is a tendency to dampness in the house mix equal parts of coarse

shavings with the straw. Damp, wet litter is a mortal enemy of winter production. It encourages colds, roup, and other troubles. When the litter becomes filthy, or moist, or too fine, change it. As a rule, changing once during the winter will be sufficient, and many times this is not even necessary. Litter protects the floor, makes the house more comfortable for the birds, and furnishes the materials in which the fowls can scratch busily during cold winter days.

Disinfect the floors, roosts, and droppings boards from time to time, if there is any infection or disease about.

Watch the water pan. Keep it filled at all times, for winter egg production depends much upon the fowls having free access to clean, fresh water. If electric, or other kinds of light are used the water supply should be kept in mind more than ever. Keep the water pans clean. Wash out every morning with a 5 per cent solution of some good disinfectant. It takes a bit of time, but it helps to insure better and continued health.

Winter Meals for Hens.

Layers demand certain things in the way of foods.

They should be supplied with those foods that will most quickly and most economically be turned over into eggs. Egg producing foods cost money, but they make more money. It always takes money to make money.

Let's lay out a day's rations for a flock of one hundred hens, fowls that are to be fed for a maximum egg production during winter days!

Hens, (100) Meals—where no lights are used in the poultry house:

Scratch Grain—A mixture of two parts of cracked

corn, one part of wheat, and one of clipped oats (by volume), fed at the rate of about 12 pounds per day per hundred hens.

Divide this amount into three feedings, for best results, consisting of three pounds first thing after breakfast, three pounds at about 11 o'clock, and six pounds toward evening. This keeps the fowls partly hungry during morning hours, tends to increase dry mash consumption, and then sends the hens to the perches with full crops.

Dry Mash—A mixture of equal parts of wheat bran, wheat middlings, ground oats, cornmeal, and meat scrap makes a very efficient dry mash. Keep it before the layers at all times. They can't eat too much of it. The grain ration keeps them warm, furnishes energy, but the dry mash makes eggs.

Green Food—Layers need green, succulent food during any season when they are under heavy production. They probably need it for the vitamins it contains, they need it for the beneficial effect of its juices, and they need the watery type of food. Mangel beets are hard to beat, as a source of winter succulence. Split two good sized beets for each hundred birds each day. Sprouted oats are splendid. Allow about a square inch per bird per day. They are money well invested.

Grit and Oyster Shells—Grit takes the place of teeth. Constant access to it should (Continued on page 1074)

These layers belong to Wyan Horn Poultry Farm, New York. Mr. Jung believes in raising pullets that will lay winter eggs and he proceeds to feed them for such performances.

The History and Development of Light Brahmas

These Old Aristocrats of the Poultry Yard Gave an Impetus to Purebred Poultry in America Which Has Ever Since Continued—An Authoritative Account by President of American Light Brahma Club. *By J. H. Drevstedt*

AS AN old and stanch admirer of the Light Brahmas we shall endeavor to record the progress and development of this breed from its origin to the present time, with due regard for authoritative data, and the pardonable personal desire, on our part, to re-create a greater interest in what we believe to be one of the greatest and most useful races of domesticated poultry produced in the United States of America.

In the 40's of the last century an Asiatic breed of fowls made its appearance in America, known at that time as Gray Shanghais. Imported from China via England, they reached the United States as Asiatics, but it did not take long before the American poultry fanciers made over the breed and produced the Light Brahmas. The parental stock was of Chinese origin, but the modern, handsome, stately Light Brahma is a purely American production, the true origin of which must be accredited to New England, U. S. A.

In giving birth to the Light Brahma, New England became the "cradle" of the American Fancy and the home of the Light Brahma is there to the present day, for in no other section of this country has the interest in one of the greatest exhibition and utility breeds in the world been as loyally and consistently sustained as by the poultry keepers and fanciers of the New England States. The fact of the Light Brahma being not only a fancier's fowl of transcendent form and color characteristics, but a superior utility breed, one that by its great meat and brown egg producing qualities appealed strongly to the progressive poultry keepers on the Eastern Coast, is the reason of its widespread popularity in that section even to this day.

The fame and fine qualities of the Light Brahmas, however, were fully recognized and appreciated by breeders and fanciers in other states, notably in New Jersey, Maryland, New York, Pennsylvania and the Middle Western States, where many fine specimens have been bred in the past, and are being bred today. Once a Light Brahma fancier, usually means always one.

In the Beginning.

The Light Brahma was the first breed that practically started the Standardbred poultry industry in America, and opened a chapter in the history of domesticated races of poultry never to be forgotten or erased, and one that will never again be made and written. When we say Chapter, we should have said Chapters, for hundreds of pages, even books, have been written about the origin and development of the Light Brahma, to say nothing of the almost endless and even bitter

controversies indulged in by breeders and promoters of the different strains bred in the early days of the breed.

Controversy raged before the American Poultry Association published its first Standard of Excellence in 1874. After that more careful and less selfishly interested writers started investigating the true origin of the Light Brahma and its subsequent development, and thus provided reliable sources of information.

It was C. C. Plaisted of Connecticut, the oldest breeder of Light Brahmas at the time, who wrote a series of articles on the breed which appeared in the "Poultry World" during 1874. Regarding the origin of this breed, Mr. Plaisted states:

The first pair of these fowls, about which there has been so much discussion and so much written, was brought by one Charles Knox to

Mr. Nelson H. Chamberlin, a resident of Hartford, Connecticut, in 1847. They were first bred by Mr. Chamberlin in 1848. Mr. Chamberlin paid for his first pair of these fowls the sum of five dollars—considered at that time a fabulous price—and had no conception of the value of his purchase or what was to be its effect on the poultry interest of the country. Charles Knox was then clerk on a propeller running between Hartford and New York, and was cousin to Mr. Chamberlin's wife. Having been requested by Mr. Chamberlin to purchase a nice pair of fowls in New York—something new—Mr. Knox reported seeing two pairs, one red, the other gray, just arrived on an East India vessel, and that he had the refusal of the pair until the next trip. The result was the selection of the grays as a venture and their removal to Hartford. Mr. Chamberlin related these facts to me himself and described the pair. The cock was white, with the exception of the tail and ends of wings, which were in contrast, black; he had yellow legs, unfeathered, a very small double comb and weighed 9½ lbs. The hen was same as cock, except a penciled neck, and weighed a little over 8 lbs. They bred buff chickens as well as gray the first year and many of them were well feathered on legs. Mr. Chamberlin also states there was one quite dark chicken in the lot—that he sold several of the chickens to his friends and the next year there were quite a large number bred in the vicinity. The reproduction of his breed was quite show, however, until 1851, and was confined almost exclusively to Connecticut up to 1852."

A letter received by Mr. Plaisted from Mr. Knox, dated July 22, 1874, corroborated the statement of Mr. Chamberlin.

A Genius Appears Upon the Scene.

The history of the Light Brahma fowl would be incomplete without reference to George P. Burnham.

The part he played, the claims he made as well as his writings are still remembered by older fanciers and read with interest and amusement by a younger generation of poultry keepers in Burnham's "History of the Hen Fever," a book which stirred the American fancy seventy or more years ago to a greater pitch of excitement than any poultry publication has since. Mr. Burnham was an educated, forceful, albeit

Modern Light Brahma cockerel. Exhibited at the Boston and New York shows, 1921.

sarcastic and humorous writer, one who understood how to "play the game" by his intimate knowledge of human nature.

Mr. Burnham was born in Boston, April, 1814. He was active and successful as a fancier for over thirty years, being engaged extensively in poultry raising at Roxbury, Mass., as far back as 1846-7.

In 1848 Burnham imported into the United States the first "Cochin China" fowl from Queen Victoria's flock, bred by J. J. Nolan of Dublin, Ireland. In 1849 he got his first Gray Shanghais from Dr. J. J. Kerr of Philadelphia, who imported them from China. It is on this stock and five other Light Gray Shanghais, obtained from W. T. Porter, of New York, that Mr. Burnham claimed all strains of Light Brahmas bred in this and other countries came from, and did not spare printer's ink in his endeavor to support his statements. He published four volumes upon the subject of poultry, all of which enjoyed an extensive sale. These publications proved of inestimable value to the Standardbred poultry industry by creating a widespread interest in purebred fowl. They also promoted a large demand for the Brahma, and incidentally brought considerable revenue to the shrewd and brilliant author. Burnham put the Brahma fowl before a startled public and reaped the reward in sales made by him at princely prices all over the world. The first Dark Brahmas ever seen in Great Britain were sent from Mr. Burnham's yards, Melrose, Mass., to that famous old English breeder, John Bailey of London, in 1853.

One hundred dollars was paid by Mr. Bailey to Burnham for this trio, which was exhibited at Birmingham, England, and carried off the first prize in the Brahma class, when one pair of the three was sold to Mr. E. Taylor for one hundred guineas—over \$500 in gold.

In the winter of 1852 George P. Burnham had sent on as a present to Queen Victoria nine full grown Gray Shanghais, which created a great sensation in England. The queen "accepted the valuable consignment with pleasure" and sent Mr. Burnham a copy of her portrait "of which she begged Mr. Burnham's acceptance." Mr. Burnham not only was glad to accept the portrait, but pleased to have the opportunity offered for publishing a reproduced copy of this picture in his last work on poultry, the China Fowl. But George P. Burnham was not only a clever publicity agent. He was more than that as the following

Laced tail coverts on a male as first exhibited at New York, 1902, by Geo. Purdue. To the right, laced tail coverts on Mr. Purdue's famous pullet "Progress," exhibited at New York 1890, which changed the fashion of Light Brahma females, and later gave rise to more coloring in the male.

Modern Light Brahma hen from a pen and ink sketch by Megargee.

Ideal Light Brahmas, 1891, as bred by I. K. Felch. Mr. Felch did not want a short legged, loose feathered female, maintaining that such females were not prolific as egg producers.

"Mr. Burnham is a pungent and voluminous writer. His articles and his humorous (but caustic) 'history of the hen fever' created opponents for him, who have criticised him sharply. But those who know him personally have found him a genial, agreeable, courteous gentleman, and in all his dealings he aims to act upon the Golden Rule."

Mr. Plaisted, who in later years had dealings with Mr. Burnham, "found him as square, upright and honorable a business man as any we have encountered," a statement that can be accepted as a correct estimate of the most virile and brilliant poultry fancier and writer of the Nineteenth Century.

Brahmas First Exhibited at Boston.

The first public exhibition of Brahmas was made by Samuel O. Hatch, Franklin, Conn., in the hall of the Fitchburg R. R. depot at Boston, Mass., November, 1851. Dr. John C. Bennett exhibited a trio of birds which he called "Brahma Pootras" at the New England Poultry Show Boston, Mass., in November, 1850, but they were light gray in color with single combs and top knots, the yellow legs being feathered slightly.

The first Light Brahmas shipped to England were sent in the fall of 1852. They were selected by Mr. Plaisted from pure Hatch stock which had been acquired by Dr. Bennett.

Mr. Hatch contributed much to the breed. He "selected birds with pea-combs,

as he considered them preferable to the single combed ones for this frosty climate. He bred them with great success, improving many of their points compared with those bred by Messrs. Chamberlin and Cornish."

Mr. Plaisted and Dr. Bennett entered into the live stock business as partners, the former selecting every Brahma shipped to England by Dr. Bennett, excepting one pair, which Dr. Gwynne purchased. In February, 1854, one trio was sold and shipped for \$300, probably the largest in size sent out that season. The cockerel, ten months old, weighed 13½ lbs. and was bred by George Smith at Valley Falls, R. I. The hens were two years old, one weighing 12 lbs., the other 12 lbs., 1 oz. These hens were bred by S. O. Hatch, Franklin, Conn. They were too dark for the Standard color requirements, but the cock was described as being a fine bird. So all these Brahmas shipped to England, were either by Dr. Bennett, S. O. Hatch, George Smith or C. C. Plaisted, excepting the pair sent to Dr. Gwynne.

Mr. Plaisted writes: "I know for a certainty that these are the fowls which Mr. L. Wright (Continued on page 1064)

Pair of Light Brahmas owned in 1872 by C. C. Plaisted. Note the light hackles and absence of lacing on tails.

historic data furnished by C. C. Plaisted clearly sets forth:

"The first public exhibition of fowls in America was inaugurated by Mr. B. at Boston, Mass., in association with Dr. John C. Bennett (of 'Brahma Pootra' notoriety) and a few other gentlemen. This show came off at the Public Garden in November, 1849, at which Mr. Burnham was a large contributor of Cochins, Shanghais, etc., and where he showed the first 'Plymouth Rocks' ever seen in the world. For several years thereafter Mr. B. was known far and wide as the largest breeder and dealer in the United States, in which pursuit he accumulated a moderately handsome fortune.

"WE LEAD, OTHERS FOLLOW"

EDITORIAL

American Poultry Journal

Entered as Second-Class Matter August 9, 1886, at the Postoffice at Chicago, Ill., under Act of March 3, 1879

SUBSCRIPTION PRICES

	1 year	2 Years	5 years
	12 issues	24 issues	60 issues
United States	\$0.75	\$1.00	\$2.00
Canada, Cuba and Mexico	1.00	1.50	3.25
Foreign	1.25	2.00	4.50

Canadian, Cuban, Mexican and foreign subscriptions require additional postage, therefore the slight difference in prices.

TRIAL SUBSCRIPTIONS — In order to acquaint prospective subscribers with American Poultry Journal, we will mail one copy a month for four consecutive months to any point in the United States, its possessions, or to Cuba or Mexico, for 25c. The trial subscription offer (4 months for 25c) is for new subscribers only and not subject to renewal for a period of less than one, two or five years.

AUTHORIZED AGENTS — Our agents are provided with receipt blanks bearing the imprint of American Poultry Journal and good only for a 4-month "trial offer." No agents are authorized to accept one, two or five-year subscriptions or subscriptions for any other publication. All one, two or five-year subscriptions should be mailed direct to our office at 523 Plymouth Court, Chicago, Ill.

TO OUR READERS.

Look at the address on your wrapper upon receipt of the first issue after subscribing. See that it is absolutely correct, and notify us of any mistake, no matter how slight. Note the expiration date which appears thereon, and renew your subscription before the expiration date.

If you change your address, give both your old and new address, as well as your subscription number, when notifying us of the change.

GUARANTEED ADVERTISERS.

Our subscribers are our friends and we use every effort to protect them in every way. We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any display advertisement appearing in this issue of American Poultry Journal.

All we ask is that, in ordering the fowls or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list.

New Jersey Leads

Since the introduction of poultry educational work into state agricultural college curriculums, the heads of the poultry instructional work, while displaying a laudable initiative and friendly rivalry, have maintained a certain uniformity of policy. Particularly in their attitude toward the breeds and their breeders, has there been a common policy, and unfortunately, it has been distinguished by its reticence to enthuse over the ideals of the breeders and to distrust the values of what have been termed "fancy chickens."

As far as experiment stations are concerned, only one, that of the U. S. Department of Agriculture at Beltsville, Maryland, has carried on its experimental work with Standard exhibition birds. Fortunately, this is the largest and most far reaching of all stations, and the work of the Federal Department has carried weight with the public in all parts of the country.

Now comes word that the ice in the states is broken. Prof. Willard C. Thompson, in charge of poultry husbandry at the New Jersey Agricultural Experiment Station, announces that he has made arrangements "to use twelve Standardbred White Leghorn cockerels from the Government Farm on the New Jersey Station flock this year, for the purpose of improvement in type."

Wonders never cease! In September we were lamenting to an official of the Government in Washington that the state colleges were going ahead with plainbred, utility Leghorns, while the Government Farm had a surplus of breeding material in the form of White Leghorn cockerels of good Standard quality with egg pedigrees. We remarked on what a wonderful thing it would be if the state colleges and experiment stations would call on the Government Farm to supply them with White Leghorn males to grade up their flocks. The U. S. Department of Agriculture does not sell stock and the natural outlet is from the Government to the states.

Happy is the day when these birds start out to improve

the flocks at the state colleges. It is a red letter day in poultry educational work. It means a coalition of the professors and the breeders, all working together for better poultry.

The progressive step taken by Professor Thompson, in the great white egg state of New Jersey, is the biggest thing that has happened in the purebred poultry industry during the year. It demonstrates a course that should be followed. And let no man think that it is discreditable to introduce blood from another breeding yard. Take a breed in which the exchange of blood is most general, such as the Rhode Island Red, and you find a breed that stands on a broad base, a breed which is not patented by any breeder, one in which good specimens appear in thousands of different breeding yards, giving rise to widespread interest. No breeder belittles himself when he secures stock that will improve the quality existing in his own flock, for such has been the course of every great and constructive breeder that ever lived.

Professor Willard Thompson deserves the highest commendation for his action. He has taken the lead in an important poultry breeding matter. A silent but fundamentally deep appreciation on the part of the Standardbred poultry breeders of America will be accorded to him.

To Buy On a Quality Basis

Harrison F. Jones, Secretary of the National Poultry, Butter and Egg Association, has transmitted to us a resolution recently adopted by the Iowa poultry buyers, as follows:

RESOLUTION

Whereas; the practice of buying live poultry without grading is an injustice to the farmers producing the better breeds of market poultry, and

Whereas; the quality of the Iowa poultry is not what it was a few years ago, due to the fact that our farmers are increasing their flocks of Mediterranean type of chickens, such as Leghorns, Minorcas, etc., and

Whereas; one of the purposes of the Iowa Wholesale Egg, Butter & Poultry Dealers' Association is to encourage the production of the most desirable market breeds of poultry, thereby increasing the reve-

nue to the farmers and making possible the rendering of a better and more uniform service by our members, therefore be it

Resolved: that we, the members of the Iowa Wholesale Egg, Butter & Poultry Dealers' Association, purchase live poultry on a graded basis, paying higher prices for hens weighing four pounds and over and for springs of the larger breeds, and less for hens under four pounds and all Leghorn springs and similar breeds, these lower prices to be commensurate with market value, and be it further

Resolved: that we, the members of the Iowa Wholesale Egg, Butter & Poultry Dealers' Association, request that each member give all publicity possible. Further, that a copy of this resolution be transmitted to the Dairy and Food Commissioner of the State of Iowa, requesting his co-operation.

A ruling of this kind has been in effect in Indiana for some years. There are sound reasons for making a difference in price between live poultry of the dual-purpose breeds and chickens of highly specialized egg breeds. Hotel, cafe and dining-car trade prefer five pound stock, because it is more economical for slicing; and the canning trade also insists on heavy stock, because 100 pounds of heavy hens produce 12 to 14 per cent more meat than can be taken off the frames of 100 lbs. of small, light hens. It follows that the country buyer should reflect these conditions in the trade and give a preference in price to heavy poultry.

The discrimination is distasteful to Leghorn breeders, although it should not be. Their birds are specialized for egg production, and are economical egg producers. Experiments covering several years on the poultry farm of the U. S. Department of Agriculture have shown that pullets of the general purpose breeds eat an average of six and seven-tenths pounds of feed per dozen eggs produced, and the yearlings eat nine and six-tenths pounds. Leghorn pullets eat four and eight-tenths pounds and the yearlings five and one-half pounds of feed per dozen eggs produced.

The Leghorn is the more economical consumer of feed, and a somewhat more fool-proof egg type. But, as a meat producer, it does not rival the dual-purpose breeds. There are, in point of fact, commercial Leghorn egg farmers who would willingly not grow any cockerels if they could distinguish sex at birth; their specific purpose in hatching is to produce pullets to fill their laying houses.

Just as we approve the buying of eggs on a quality basis, which benefits the egg farmer, so we would like to see the buying of poultry on a still more carefully graded basis. Among the keepers of large fowls, there is a great difference in the quality and condition of the stock. Compare a well-bred flock of Barred Plymouth Rocks that is in fine fettle, plump and healthy, to the cull hens of a grade flock. Country poultry buyers should not assume that any dominique colored hen is a good buy. Some of them are one finger, tuberculous culls; some weigh heavy because their body cavities are full of compressed egg yolks. The farmer culls out the skin-and-bone hens, also the hens with hard abdomens. He sells them to the poultry buyer. It should be the buyer's business to recognize that they are cull market poultry, as well as cull breeding poultry. No country buyer is fair to the enlightened poultry keepers of his community, when the price he pays is an average price. Under such conditions the owner and producer of good table poultry gets no more for his stock than the man who has culled and sold to the buyer the riff-raff of the farm.

Put country buying on an actual quality basis and the co-operative shipping movement will subside into inactivity. Co-operative egg and poultry shipping is only the banding together of quality producers to come into direct contract with a market that recognizes quality, carefully grades receipts and pays accordingly.

The country buyer should study quality. He should then grasp the significant fact that he is a co-operator, and that his function is to link up the producer with the consumer in an economical and efficient way. If he is only in business for the sake of getting when the getting is good, and getting as much as he can, he will find that progressive poultry owners will seek their own market in order to secure proper and adequate recompense for their efforts in producing good table poultry.

Poultry Extension Work

What Harley Williams and T. S. Townsley are doing for poultry producers in their respective states, as reported elsewhere in this issue, is being duplicated, with modifications, in nearly every state in the Union. Indeed, the time has come when the agricultural extension force of no state agricultural college is complete without a poultry specialist.

A high type of men have taken up this branch of field work, and poultry extension men are recognized as among the most energetic, best equipped men on the college staffs. Moreover, they are not characterized by aimlessness. Their work invariably has direction, and they as invariably reach their destination.

In Kentucky, A. S. Chapin, poultry field agent of the state college has put forward a big standardization plan. A number of counties in Kentucky have adopted his standardization project, and are introducing all Barred Plymouth Rocks, White Plymouth Rocks, Rhode Island Reds, or White Wyandottes.

More than 8,000 pullets from the four varieties were offered at auction this past fall, in sixteen county pullet sales. The pullet sales were a part of the general plan worked out, to make it possible for all farmers in the various counties to obtain stock birds from the breed being used to standardize the county flocks. Banks and other persons co-operating in the movement had furnished money for the purchase of hatching eggs, and the farmers who received them had agreed to return one pullet for each setting of eggs.

The money from the pullet sales was then returned to the banks, which had bought the eggs for distribution. Pullets brought in by the farmers were culled and graded by specialists from the poultry department of the College of Agriculture and sold either as "firsts" or "seconds." The sales offered an opportunity for other farmers to obtain purebred pullets at reasonable prices, and thereby aid in increasing the number of purebred hens on Kentucky farms.

The program in Kentucky is big, but R. L. Mason in West Virginia, Leroy Jones in Indiana, Roy E. Jones in Connecticut, H. B. Lansden in Arkansas, and poultry extension men in other states can make reports of equal scope and far reaching results. Each is working along lines that are most acceptable in their different states, but the goal of each worker is the same, i. e., selected flocks, modern equipment, improved methods, more profitable returns.

What a change has come over some of the states. Nebraska, whose fertile prairies are employed in "heavy farming," and whose farmers pride themselves on their Percheron horses, beef cattle and pork hogs, are taking a new interest in poultry. When the U. S. Department of Agriculture inaugurated its better sires campaign, Nebraska farmers were told that if all their live stock were purebred and their roosters were mongrels, a Government purebred sire certificate would not be issued for their farm. That brought a sudden awakening to the farmer who took pride in his live stock, but relegated the chickens to the realm of "woman's work."

The following letter from Chas. T. Cornman, who, as extension poultryman in Nebraska, has worked so industriously to improve poultry methods, will be read with interest by those who are interested in poultry education as a necessary forerunner to a bigger and better poultry industry:

"The improvement in poultry conditions in Nebraska within the past three years has indeed been remarkable. When I first came into the work the majority of our flocks were either mongrels or cross-breeds, under that erroneous idea that the more you mix your fowls the better the results. After driving home facts that you get less eggs and poorer eggs, less pounds of meat and poorer meat from this class of fowls, and preaching and preaching the gospel of standardization, one can now travel over counties and rarely find one of the old time flocks.

"The work has had a marked influence on the character of the product and Nebraska eggs and poultry are in high favor with both produce dealers and consumers.

"Where poultry is being properly cared for it has become the best paying side line on the Nebraska farm, and I have challenged thous-

ands of farmers to refute my statement that every twenty-five hens properly cared for are equivalent in revenue to one of their cows.

"When I first came into the work I could not get a man out to one of our demonstrations for the reason that the Nebraska hen was considered to be too insignificant for the farmer to have anything to do with, and they constantly sang the old, old song of 'Let the women do the work, let the women do the work.' The women have done the work, and they have compelled the men to sit up and take notice and today we are having thousands of men joining hands with their wives in the good work and we have now that splendid co-operation of the men and women, and the boys and girls and it speaks of very much better things in the future of poultry in this great state."

Mr. Cornman is a man of unusual poultry experience. A prominent breeder and judge for years, formerly editor of "Poultry Item," he took into his work an experience that measured up to a man's size job and made it possible for him to focus the attention of a great state on its farm poultry.

Good luck and more power to the extension poultrymen of America! All well wishers of the industry are interested in your progress.

So-Called "Kee-Wee" Chickens.

The Kansas City Post last spring published a special article on what it was pleased to call "a new race of super chickens," and the author of that article boldly stated that the birds were the result of crossing "the Kiwis, a dwarf Australian ostrich, and the White Rock variety of chickens." Announcement was also made in the article that the breed had been intro-

"Australian Kiwi's Chicken"

duced into the middle west by Henry Boener of Kansas.

Late in the fall, Mrs. H. A. Boener of Kansas shipped a pair of these birds to Illinois, and an old fancier who has inspected the pair writes us as follows:

The latest freak chickens: Kiwis! Funk & Wagnall's dictionary defines "Kiwi" as follows: "A New Zealand apterygoid bird having loose plumage and long bill with nostrils near the tip; these birds are nocturnal in their habits and feed mostly on earth worms." I had my curiosity aroused the other day when a friend asked me whether I had seen Kiwi Chickens. The Kiwis he informed me were produced by a cross of a small Australian Ostrich, commonly known as Kiwis, and White Plymouth Rock hens.

There is a possibility of producing an odd variety of birds by this cross, but the progeny, like the common mule, is bound to be simply a hybrid incapable of reproduction when bred together. I looked at a pair of these Kiwis and to me they appeared to be nothing more than the so-called Missouri Fluffs.

Among all domestic varieties of fowls we have occasionally a bird that is abnormal in some respect. Many birds have been shown at different times that had the plumage growing "reversed," giving them a fluffy appearance, and fowls with loose or fluffy plumage have been exhibited in quite a number of varieties, the best known being the Japanese Silkies, which, when bred, often revert to their original progenitors and have regulation style hen feathers instead of the silky down.

These Kiwis looked to me like a regular White Rock Silky, having comb, wattles, faces, and lobes like all chickens, but what "got" me most was the intense deep orange yellow legs. Surely no Kiwi or ostrich ever had as yellow, clean legs as these birds, nor comb and other appendages. The male was a fairly well developed specimen with good Rock head, eyes, beak, wattles and pronounced yellow legs. He had a regular chicken's crow, and when he did crow, he threw back his head and closed his eyes, because "he knew the tune by heart" and did not have to read the notes. The pullet apparently is getting ready to begin laying as she frequents the nest daily, and the proud possessor of these kiwis is anxiously awaiting the appearance of the first egg, so he can tell whether they will be any different from other eggs; and he has overhauled and cleaned up a small Buckeye Incubator to set the eggs as soon as there will be as many as 6 or 9.

Mrs. Boener, the American exploiter of the breed, has favored us with a photograph of one of her hens from which the accompanying illustration was made. Nothing unusual about this hen, except that her feathers have no web, a structural deficiency found in rare instances in birds

Regal White Wyandotte Book

Have you had a copy?

THIS is, without a doubt, the most complete book ever published dealing wholly with the White Wyandotte. It is full of illustrations from life and its pages deal with a variety of subjects including chapters on origin, description, feeding, care of breeding stock, fertility, color characteristics, raising young chicks, washing and fitting for exhibition, poultry diseases, mating and breeding, description of Wyandotte type. The frontispiece is a beautiful colored reproduction of my first prize pen at Boston.

My object in issuing this book is to bring to the attention of every White Wyandotte breeder, the Regal Dorcas strain which leads the world, not only in the show rooms but also in the laying contests. For 16 years at the New York State Fair, the Regals have defeated all competition, while my winnings at Madison Square Garden, Boston and Kansas City have never been approached. If you wish to know more about these famous birds, send one dime for a copy of the Regal White Wyandotte Book. The information it contains will be worth many dollars to you.

5000 Cocks, Hens, Cockerels and Pullets For Sale

This season I have the finest flock of White Wyandottes I ever owned. However, the demand is very heavy and orders should be placed as early as possible.

Pedigreed Cockerels, Exhibition or Dorcas breeding	\$10, \$15, \$20, \$25, \$35	Breeding Pens, male and four females	\$40.00, \$50.00, \$75.00, \$100.00
Pedigreed Hens and Pullets	\$7.50, \$10.00, \$15.00, \$20.00 and \$25.00	Strong Utility Cockerels,	\$5.00 and \$8.00 each
		Utility Hens and Pullets,	\$5.00 and \$6.00 each

JOHN S. MARTIN

Box 51, PORT DOVER, ONTARIO, CANADA

of a number of normal breeds, such as Black Langshans, Black Orpingtons, Rhode Island Reds, and White Plymouth Rocks. The old Klondike was a sort of silky feathered White Rock, bred pure enough to be designated as a breed, as is also the newer Missouri Fluff.

In advertising her silky-feathered birds, Mrs. Boener states:

"We have no wings.

"We have no feathers.

"We make the best of fur.

"We like to be skinned or picked.

"We have the O. K. of all the chicken fanciers of the world."

None of these things are true. Moreover, can a new breed be produced by crossing ostriches and chickens?

While most of us remain credulous enough to still be looking for a "super hen," we are well enough grounded in the laws of heredity to look with suspicion on any statement that would discredit the fixity of species.

The definiteness of species has become a strict canon of scientific faith. When the name "hen," or "ostrich," or "dog," or "horse" is applied, the specimen is elevated to a specific rank in a permanent group of animals.

Each species reproduces after its own kind, and when two species are crossed, such as the pheasant and the hen, or the ass and the horse, hybridization results, and although the offspring are vigorous and normally developed, they are sterile. In other words, the crossing of distinct species produces hybrids, a word from the Greek which means lawless and unnatural.

We do not look for improvement by the ostrich-hen route; but a poultryman so uninformed of the physical conformation of his fowls as to announce that his hens, of which the accompanying illustration is a faithful likeness, have no wings, is evidently willing to believe anything on evidence so slight that he is easily imposed upon.

Barred Plymouth Rocks.

More than one breeder now rejoices in the ownership of some Barred Rock cockerels like the one shown on the next page. The bird still needs a little more time before he will be at his best. His tail needs to grow out a little more, his saddle and neck hackle need time to grow down a little fuller; but his strong face, well placed legs of good bone, and well proportioned body are typical of a good cockerel early in December.

The photograph was made by an amateur, yet where the barring shows distinctly it will be found to be barring that runs straight across the feather. In contrast to this, note the lack of straight and distinct barring in the picture of the female. The difference between these two birds is a difference of ancestry. The hen is only a "grade" Plymouth Rock, while the cockerel comes from a fancier's line of carefully bred birds.

If this cockerel should be mated to this grade female, the young stock would show a distinct improvement in the quality and character of its barring.

The male of this variety exerts a

Why

not buy the best in Poultry?

U. R. Fishel's White Plymouth Rocks

Have Demonstrated Their Superiority

They deserve your consideration for they invariably win the prizes, produce more eggs and mature into larger meat birds.

It has taken thirty years of careful mating to make them do it. That's why an investment in them is poultry insurance.

wonderful influence. The male transmits barring to the pullets he sires. He joins with the hen in transmitting barring to the cockerels he sires. For this reason, the cockerels from a pair of Barred Rocks inherit a double dose of barring, while the pullets inherit a single dose.

The cockerels, therefore, are always "more barred" than the pullets. This makes the cockerels a dash lighter in color than the pullets, for, assuming that the breed would be black if it were not for the bars of white, when you put a double dose of white barring into the male offspring, you produce a lighter appearing sex.

To make it plain that the male transmits barring to his daughters, and both the male and female transmit barring to their sons, let us cite the evidence: If a Barred male is mated to a dark colored female free from barring, such as the Dark Cornish, both the cockerels and pullets are barred. But if a Barred female is mated to a Dark Cornish male, only the cockerels from this union are barred and the pullets are black. The Barred female can only transmit barring to her male offspring.

Let us cite another example to show that the barred male inherits barring from both sire and dam. Look over a farm bred lot of Barred Plymouth Rock chicks that are two months old. The pullets will appear darker than their brothers, and close inspection will reveal that the white bar in the cockerels is much cleaner, much purer, and the black bar much sharper than in the pullets whose black runs into the white and whose white bar is not a clean cut white. The reason is that the cockerels have inherited a double dose of white barring, and when they mature they will be lighter in color than their sisters.

When one looks at a Barred Plymouth Rock and speaks of it being "a good colored bird," he means that it has nice barring and the dark bars are of the right tone of color. But, the fact is that color pigment and barring are two separate factors when it comes to heredity and transmission. The male is the prime factor in stamping definiteness of barring on his offspring, but whether that barring is to appear light and weak in color or dark and strong will depend on the amount of black color in the dam.

Confusion has existed for a long time because it has been assumed that the Barred Rock was a white chicken

with black bars on it. Genetically it is a black chicken with white bars, and the male being "more barred," it is natural for the males to come lighter than the females.

The Standard calls for the same color in the exhibition male as in the exhibition female. That is easy. Simply use a female darker than Standard to produce your exhibition male.

For many years breeders were satisfied to do this. They termed their

A Purebred Barred Plymouth Rock Cockerel

dark, cockerel - breeding females, "cockerel-bred," sold them to other breeders who wanted them, but kept them out of the shows. Now, however, breeders are clamoring for classes for "cockerel-bred" females, also "pullet-bred" males.

Some go so far as to say that there are "two varieties of Barred Plymouth Rocks, the Dark Barred Rock and the Light Barred Rock."

There is only one variety. There is no issue on this matter. The big issue is to understand that variety and breed better birds.

The Brown Leghorn offers an entirely different case. The Brown male belongs to a penciled variety, the female to a stippled variety. Dark and Light Brown Leghorns are two distinct varieties that cannot be crossed together with any hope of success; whereas light and dark Barred Rocks have been crossed back and forth to advantage.

The tendency of recent years has been to clean up the barring in the males, and a rusty shouldered, metallic barred bird today has no chance. On the other hand a wide, open barred female is now too light. As a result the two lines are so closely approaching one another that in a well bred flock the breeder himself has to have

A Grade Barred Plymouth Rock Female

Hatch with Electricity

Lectro-hatch
Electric Incubator
Element

Convert your Old Incubator into a Modern Electric

Easily installed. Steady, even heat. Needs no watching. No fumes. More and better chicks.

Why worry along with the fuss, dirt and inferior results of an oil or coal incubator, when you can so easily and so cheaply convert it into a clean, modern, dependable electric machine?

It takes but a few moments to put the Lectro-hatch Electric Incubator Element into your old machine, and there you are—ready to hatch with electricity.

Think what it means to turn an electric button and let electricity hatch your chicks in an incubator that regulates its own heat and needs no watching.

Clean, Convenient and Always Dependable

The Lectro-hatch is so clean, simple and odorless that you can keep it anywhere in your home. It has no lamp to fill, no wick to trim, no smoke, no soot, no risk of fire or explosion. It automatically regulates its own heat and needs no attention whatever, except the turning of eggs when desired.

So far as temperature is concerned, you can go away and leave it for days at a time. When you come back, the weather may have changed, the room may be cold, but the temperature in your incubator will be just exactly what it was when you left it. You adjust the Lectro-hatch to any temperature you want and it maintains that same steady, even heat all the time, until you're ready to change it or shut it off.

Bigger Hatches of Healthier Chicks

Remember, with the Lectro-hatch, there is no smoke or poisonous gas to stunt or kill the chicks in the shell. Fresh, pure air circulates constantly. There are no cold corners, no ups and downs in the temperature. The largest, most successful poultry raisers in the United States will tell you, from experience, that day-old chicks from Lectro-hatch machines have the appearance of being one week

old. They are bigger, livelier, healthier in every way. And it is not uncommon to hatch 80 to 90 percent of the fertile eggs in the Lectro-hatch.

Easy to Install, and Even Easier to Operate

We send plain and complete instructions for converting your machine into an electric. You don't have to know a single thing about electricity to install the Lectro-hatch or to run the incubator. Bore a hole and drive a few tacks—that's all there is to installing it. Turn a thumb nut until the thermometer shows just the degree you want. After that, our patented Regutroller automatically holds that temperature for you, absolutely steady and even.

Lectro-hatch Elements are made to fit any size or style of machine. They attach to any electric light socket, and operate from any kind of electric current—from farm lighting plant, traction line or town lighting systems.

Costs Very Little

The cost of a Lectro-hatch Element is small, and the expense of operating it figures about the same as for a good grade of oil. But, oh, what an enormous difference in hatching results, in cleanliness, in ease, convenience, and peace of mind.

Hatch With Electricity This Year

If you are interested in electric hatching, write us at once. We can supply either the element to convert your old machines or complete new Electric Incubators and Brooders. The same wonderful principles are in both—steady, even, dependable heat; no worry, no work, no watching, no smoke, no gas, and absolute assurance of bigger hatches and better, healthier chicks.

Investigate electric hatching—the most wonderful development in the poultry industry. Write to-day for complete information.

Electric Controller Co., 410 E. 10th St., Indianapolis, Ind.

Read What Leading Poultry Raisers Say About It.

Will Increase Lectro-hatch Capacity and Eventually Use Nothing Else.

"We are glad to say that the electric heating system installed in our Mammoth Incubators was entirely satisfactory, the percent of hatch being very much increased and the chicks large and strong. We hope to be able to increase our Lectro-hatch capacity each year and eventually use nothing else."
—PORTERFIELD HATCHERY, Richmond, Indiana.

U. R. Fishel, World's Leading White Rock Breeder, says:

"We are the first to use exclusively in our Mammoth Hatchery of 18,000 capacity, the wonder element, ELECTRICITY. Not only does this method of incubation hatch stronger chicks, but it hatches larger ones. They really look like week-old chicks as hatched by the old method of incubation." (Note: Mr. Fishel uses Lectro-hatch.)—U. R. FISHEL, Fishelton Farms, Hope, Ind.

Large Commercial Hatchery Pleased with Lectro-hatch.

"The two machines we fitted with your Electric Element are working splendidly. The absolute safety in their operation, with the better hatched chicks and the elimination of all worry over regulation of temperature, regardless of weather changes, brings to the hatcher as near a perfect incubation device as seems possible. We hope shortly to install more machines fitted with your appliance."—SNOWFLAKE HATCHERY, Indianapolis, Ind.

Judge Walter C. Young, A. P. A. Judge, Supt. Moraine Farm, Dayton, O., says:

"Never have I operated a machine that holds such an even temperature, all through the hatch, as the Lectro-hatch. And the most pleasing feature of all is the size, weight and vigor of the chicks as they come out. Last year we hatched 75 percent of all fertile eggs left in the machine. One hatch in particular we brought out 83 chicks from 85 eggs."—WALTER C. YOUNG, Supt. Moraine Farm, Dayton, Ohio.

KERLIN~QUALITY

English~American S. C. White Leghorns

BABY CHICKS FOR 1922

From Our Celebrated 265 to 270 Egg Strain Foundation Stock of

recourse to toe marks and pedigree records to determine the exact lineage of occasional birds that appear in his flock. The cockerel and pullet lines are being brought together, and the variety is making more progress than ever before in its history.

Indeed, has not the Barred Rock out-run its Standard? We know it is a hard variety for which to write a Standard; it is difficult to put the ideal color in words. Someone has said that "the Barred Plymouth Rock is a poem in colors." The authors of the present Standard have sought to define this dream, using the following language.

- (a) "Plumage: grayish white,
- (b) "each feather crossed by regular,
- (c) "narrow,
- (d) "parallel,
- (e) "sharply defined,
- (f) "dark bars that stop short of positive black;
- (g) "free from shafting, brownish tinge or metallic sheen;
- (h) "the light and dark bars to be of equal width,
- (i) "in number proportionate to the length of the feathers,
- (j) "and to extend throughout the length of feathers in all sections of the fowl;
- (k) "each feather ending with a narrow, dark tip;
- (l) "the combination of over-lapping feathers giving the plumage a bluish appearance
- (m) "and of one even shade throughout."

This is the Standard description. Does it represent the ideal of today? Let us see:

(a) The white bar should be as white as you can get it. No one has yet bred the white bar too clean. One great improvement in the past ten years has been in cleaning up the white bar and thus securing sharper contrast between it and the dark bar. "Grayish white" is an out of date term to use in describing the light bar.

(b) The barring should be equally spaced. Some feathers show wider white bars as the barring approaches the down, and narrower white bars in the web of the surface.

(c) The bars should not be wide and coarse, although extreme narrowness has no special merit. Very narrow barring appears on narrow feathers. Average width of feathers is the normal thing and much to be desired to extreme narrowness, or fineness of barring.

(d) The bar should run straight across the feather in parallel lines.

(e) The dark bar should be sharply defined by being confined within itself, and not running into the white bar.

(g) The dark bar is black. There must be no modifying color in this dark bar, such as brown. The bar, however, must not be an intense black such as is secured from metallic sheen. It must be a pure, soft black.

(h) The dark bar is a trifle wider than the white bar in a majority of the best specimens.

(i) The number of bars is not proportionate to the length of feathers. If this were true the wing flights would carry as many bars as a cock's saddle, both being the same length.

(j) This means that the under plumage should be barred the same as the surface plumage, and that the under barring should be as much like the surface barring as possible.

(k) The feather should end with a dark bar rather than a white bar.

(l) The combination of black and white gives rise to the bluish appearance, just as the black in the Blue Andalusian, being free from metallic, and interspersed with white, gives rise to the blue tone of color. There is no blue pigment in chickens; and what appears blue is due to black being modified by white.

(m) The bird should be of the same shade of color all over. Moreover, it should have the same kind of barring all over. Many nice pullets are narrow barred on the back and open barred on the wing bows.

This matter of an accurate Standard description for Barred Plymouth Rocks, so amateurs may understand what really constitutes a good bird, is

It's A Winner!

My New Super Sol-Hot Heater Creates Sensation Among Poultry Raisers

My big double page advertisement last month announcing my New Super Sol-Hot Heaters for Incubators and Brooders certainly did make a big hit. Letters came pouring in from poultry raisers all over the country asking for my free catalog folder giving detailed particulars of my new heater. Such expressions as "just what I've been waiting for"—"I think you have just what I want"—"you've solved a problem for me" in letters I received, prove conclusively that the New Super Sol-Hot meets with the universal approval of poultry raisers — it marks the dawn of a new era for poultrymen.

Made in 5 sizes suitable for Small Brooders and Incubators from 60 egg and chick sizes to 3000 egg and chick outfits.

Pat. Oct. 4, 1921

Automatic Oil Control!

The New Super Sol-Hot oil control is positively automatic — no trouble of any kind — Sol-Hot burns evenly all the time—you simply light the burner, that's all—no hand adjustments—the burner won't go out—won't overflow, won't smoke—the action of the automatic oil control is positively infallible. My new patented oil control entirely eliminates the element of human control.

Pat. Mar. 29, 1921

All Metal Vaporizer

I am the originator, inventor and patentee of Wickless, Blue Flame Oil Heaters, also Metal Vaporizers, which does away with all wicks, including asbestos rings. Don't be misled by claims of others. Accept no substitutes, then you won't be borrowing trouble. Why take chances—when you buy my Sol-Hot Heaters you are assured of the latest, most efficient, satisfactory and safest brooding equipment on the market. Produces more heat from the same amount of oil than any other. Uses either asbestos rings or my metal vaporizer.

Sol-Hot Canopy Brooders

Sol-Hot Canopy Brooders heated with the New Super Sol-Hot Heater makes the ideal combination for the successful rearing of chicks. Safe and dependable—uniform heat all the time—you can depend on it day or night—no danger of heater going out—no danger of chicks being smothered with gas fumes and smoke. Sol-Hot Canopies are furnished in three sizes—32, 42 and 52 inches in diameter. We also make the Baby Sol-Hot with 22-inch canopy to meet requirements of the back lotter with small broods.

Illustration showing Sol-Hot Heaters for Incubators

SOL-HOT Canopy Brooder

Pat. Oct. 4, 1921

Write For Free Catalog Folder

We haven't space in this advertisement to tell you all about Sol-Hot Heaters and Canopy Brooders—our new illustrated catalog folder tells all about them—how and why they are better—explains all about the new automatic oil control—how it operates, etc. This catalog folder will be sent free on request.

Don't buy equipment of any kind until you learn about the better Sol-Hot. We urge dealers and agents to arrange now for their allotment of heaters and brooders—this is going to be a Sol-Hot year.

Hillview Leghorns

win against all breeds at the
Arkansas Egg-laying Contest
Finished 78 eggs ahead of nearest
competitor. Won by H. C. Porter,
Fayetteville, Ark.—A CUSTOMER

At the last Missouri Egg-laying Contest five Hillview birds hatched June 26th layed 1096 eggs for the year. Best record over all Leghorn pens from January 1st to October 31st. 1st prize pen Missouri Egg-laying Contest, 1918. 1st prize yearling hen pen American Egg-laying Contest, 1918. Official individual records: 257, 248, 263, 217, 248, 257, 251, 243, 240, 246, 267, 238, 233.

These Official records show that Hillview strain has produced more exhibition hens with official records ranging from 200 up to 267 eggs in one year, than any other strain. These performances have conclusively demonstrated that Hillview Leghorns as a combination of exhibition and laying qualities, have no equals in America today, and that they will lay more eggs in a year than the so-called Utility kind.

Exhibition Birds

They have many years of glorious winning records back of them. This undefeated line of Champion Producers of every season, have always triumphed above them all in America's largest show rooms. The exhibition supremacy of Hillview Leghorns, has been decisively demonstrated by the winning of almost every ribbon for three consecutive years (1918, 1919 and 1920) at the Chicago Coliseum Show, the greatest of all the White Leghorn Shows—a performance never approached by any other strain in existence today.

Guaranteed winners for any show in the country

When we make you this offer, we mean exactly what we say, we will furnish you winning birds for any show, regardless of competition. We have them by the hundreds, and can fill orders of any size and for any show.

Why you should breed Hillview Strain

Because we can furnish you birds that have years of constructive line breeding back of them, because we can furnish you birds mated in perfect blood lines that will assure you absolutely satisfactory breeding results, because we will assist you indefinitely in building up your flock—BECAUSE YOUR SUCCESS IS OUR SUCCESS.

Catalog and Bulletin No. 61—Free Upon Request—Write Today.

HILLVIEW FARM Box 4004 BENLD, ILLINOIS

infinitely more important than the propagation of confusion on a trumped up issue of two varieties of Barred Plymouth Rocks, one light, the other dark.

It is true in wild birds that the female is darker than the male. The male is the brighter, more gorgeously colored sex. This is true in a number of varieties of chickens, such as the penciled and stippled varieties.

In Barred Plymouth Rocks the male has the same color markings as the female, and he has no different and ostentatious display. But, the old fundamental law holds that the female shall be the darker of the two sexes.

Man made the breed, and makes the Standard for it. He chooses to require that the finest exhibition males shall be of the same color as the females, so that the two sexes will match in the show pen. Now, the cockerels from the exhibition hens come a shade lighter. In order to obtain cockerels that are the same shade of color as the exhibition female, it is necessary to breed dark colored females that show some metallic in their dark bar. That is the so-called "secret" of mating Barred Plymouth Rocks. How it offers an excuse to legislate into existence a Light Barred Plymouth Rock variety, composed of the exhibition female and her light sons, and a Dark Barred Plymouth Rock variety, composed of the exhibition male and his dark daughters, is past the understanding of the leading breeders who are producing the living models that set the progressive ideals by which all other Barred Plymouth Rocks are judged.

The Produce Market.

New Jersey white shelled eggs were 98 cents a dozen, New York, Nov. 12, which means that fresh eggs were retailing at substantially over \$1 a dozen. In respect to poultry prices, J. W. Meloney Co., commission merchants, under date of Nov. 15, advise: "Good prices will be obtained for poultry on this market for the Thanksgiving trade. Real fancy turkeys selling from 55c to 3c; fancy geese, 35c to 38c; fancy ducks, 35c to 36c; capons, large, 56c to 58c; large roasting chickens, 50c a lb. Exceptionally fine stock at this writing is selling about the same as a year ago, and with feed cost so much less surely the poultry producers are doing exceedingly well under the present conditions. It is doubtful, however, whether such prices will be obtained for the Christmas trade as considerable more poultry will be on the market and same will naturally be in better condition, especially turkeys."

Light Colored Yolks

Scientific experiments have been made with the pigment called "carotin," which is a common coloring matter met with in Nature. Carrots are rich in "carotin"; in fact, it derives its name from this source. Maize and green feed also contain quantities of the same coloring matter.

It was noted that hens fed largely on maize, with abundance of greenstuff, produced eggs with bright reddish yolks. On the other hand, birds fed mostly on maize, without greenstuff, laid eggs with light yellow yolks.

Going a step farther, and eliminating all foods containing "carotin," a white yolked egg was produced.

Chickens raised on this food had white shanks and white beaks, and, when matured, laid white yolked eggs.

W. S. Russell Appointed.

President Rigg announces that he has appointed W. S. Russell, formerly of Iowa, whose present address is San Leandro, Cal., a member of the Board of Directors of the A. P. A. to succeed W. H. Hocking of Los Angeles, Cal.

Egg Producing Cockerels

O. W. Knighton, Roanoke, Va., says: "The pedigreed cockerel I bought of you was the best buy of my poultry venture—he is a wonder in transmitting the "word" egg to his daughters." Miss See Rice, Agricultural and Economics Agent, Sardis, Miss., writes: "The fine cockerel I bought of you for a Club Member was in the pen that won the State Record. The Club Member I purchased him for received a trip to Washington as a prize for his wonderful record." J. D. Pingree, New London, N. H., writes: "I have a pen of 35 pullets from the cockerel I bought of you that commenced to lay at four months and one day. They averaged 198 eggs for the flock the first year." These are but a few of the thousands of letters we receive telling of the wonderful results obtained from cockerels that were bred by

PARKS' Bred-to-Lay and-Do-Lay BARRED PLYMOUTH ROCKS

1889 to
1921

These letters prove conclusively that to maintain a high egg production you must have Parks' Barred Rocks. Monthly high records don't mean anything unless there has been a high average maintained during the twelve months of the year—that's where Parks' Bred-to-Lay-and-Do-Lay Barred Plymouth Rocks "shine." In the coldest winter months you are assured of practically an egg a day for every month. Read these reports:

"I have just won Michigan Egg Laying Contest with pen of Rocks sired by Pedigreed Cockerel from you."

L. W. Aistine, Grand Rapids, Mich.

"12 hens laid 9 to 12 eggs a day in winter." "I got eggs all winter while others got none."

Write today for 16-page free circular—it tells the whole story. We also have large Copyrighted Catalog Booklet of Facts. Sent for Twenty Five Cents.

J. W. PARKS, Box J, ALTOONA, PENN.

CURRENT NOTES AND COMMENT

The Storrs Contest.

After the Barred Rocks had won the International egg contest at Storrs, Conn., for two years, the highest honors now go to a pen of 10 White Wyandotte pullets which laid 2,234 eggs in the year ending November 1. They were entered by Obed G. Knight, of Rhode Island, who had previously won the Storrs contest on a pen of White Wyandottes in 1916. White Leghorns came in for second place this year, a pen entered by Hollywood Farms, Washington, laying 2,218 eggs, an average of about 222 eggs per bird. This is somewhat lower than Pacific coast performance, due, it is commonly believed, to a difference in climate.

There were 1,000 females in the Storrs contest of 10 different varieties. They produced 159,700 eggs, an average of about 160 eggs per bird for the year.

The highest individual performance in the Storrs contest was the record of a Hollywood White Leghorn which laid 263 eggs during the year.

Can You Name This Variety.

What variety is illustrated in the above picture of a hen?

That is question number one. It will prove a good brain teaser for many judges who are licensed to judge all varieties including this one.

Should this female be disqualified? If so, why?

(Interval for observation, reflection and decision.)

Answer—The variety is known as Sultans, and is described, but not illustrated, on pages 319 and 320 of the Standard. The specimen here illustrated is devoid of beard, and this is a disqualification.

The Sultan is similar to the White Polish except that it has five toes, vulture hocks and feathered shanks and toes. Sultans are very tame except when frightened, when they can fly like a wild bird "and shortly afterwards come down and eat out of one's hand." They lay a large egg for their less than medium size of body. Sultans came originally from Turkey and were first bred in America by Geo. O. Brown of Maryland.

Do not ask us where you can buy Sultans; only occasionally do they appear in the shows. Licensed judges, however, should know the breed when they see it, and we print the picture for their instruction as well as amusement.

Get the Big Profits With Pure Breeds

Learn How to Start Pure-Bred Flocks With Old Trusty

Old Trusty hatches them all, pure breed or cross breed. Either makes money but pure breeds give you the high-priced eggs for hatching, high-priced fowls for brood stock and usually higher laying records. Pure breeds make more money and take no more time or trouble.

The Johnsons have helped many families to bigger money by helping them start more and better pure breed flocks. This is just another one of the many subjects you will find in my big free 1922 book of poultry profits.

Send For Your Copy of This Book—FREE

It is our catalog and a lot more. It is a poultry book for every poultry raiser who wants to make more money. It is filled with facts picked up from our 29 years' experience—facts that mean money-making helps to you.

Now is the time to start. Hatch early for egg production and early shows. Get the big profits. Make more money—win more blue ribbons. Our book will help you. Old Trusty will deliver the chicks and Old Trusty Brooders will save them for you.

Get My 1922 Reduced Prices On Old Trusty

Yes, I'll save you money on Old Trusty at its new 1922 price. I've cut the prices to the limit and am making a drive for orders this year with a price that gives you the best value for the money that we have ever offered. A better built Old Trusty too—with new improved features—new metal tray slides—improved ventilation tubes and moisture wicks, and the finest pure copper hot water heating system that was ever put into an incubator. My 1922 free book tells the story. Send for your copy today. Ask for Catalog No. 25-F

Keeler's Wh. Wyandottes

"THE WORLD'S GREATEST STRAIN"

The Aristocrats of the White Wyandotte World

THE ACE. 1st Chicago Cockerel, Jan., 1921; Champion Cock, American Class

Made the stupendous record at the National Poultry Show, Chicago, 1921 in a class of 214 birds shown by 14 competitors by winning 1, 2, 4, 5 cocks 1, 3, 4, 5 cockerels; 2, 3, 5 pullets, 2, 3, 4 hens; 1, 2, 3, 4, 5 pens. Special for Champion Male. Special for Best Display. Champion Cockerel American Class.

In the Bred-to-Lay Class my 261, 265, 273 and 288 record hens won 1st, 2nd, 3rd and 4th hens.

Proof That They Win!

R. A. Stephenson of Cushing, Okla., Oct. 9, 1921, writes: Exhibited cock purchased last March at Cushing Sept. 15-18. He won 1st and Sweepstakes prize. Best bird in the show, over 800 entries in show.

T. C. Rofferty of Canton, Ill., May 28, 1921, writes: I have been showing your "World's Greatest Strain" since 1908 at Illinois State Show and other shows. I have won more blue ribbons and specials than all my competitors combined.

Geo. J. Wendt of Milwaukee, Wis., Aug. 20, 1921, writes: Received cockerel O. K. He won first, Wisconsin State Fair. Shall want some pullets for the winter shows.

The letters shown to the left are but a few of thousands we receive telling of the wonderful wins made by Keeler's White Wyandottes in the hands of customers. Such winnings as these may be yours.

Exhibition Birds: Cocks and Cockerels, \$25, \$35 and \$50 upwards. Hens and Pullets, \$15, \$25, \$35 and \$50 each. Show Pens, \$60, \$75, \$100, \$150 and \$200.

3000 Birds for Sale

Breeding Cocks and Cockerels, \$8, \$10, \$15 and \$25 each. Breeding Hens and Pullets, \$8, \$10, \$15 and \$25 each. Breeding Pens (1 male and 4 females) \$25, \$40 and \$60.

SPECIAL;—110 Yearling Cocks from my eight best pens of 1920. Prices \$8.00, \$15.00, \$25.00, \$35.00 and \$50.00

Let us have your order now for Show Birds or breeders with the most careful of breeding for your foundation stock or new blood for 1922 pens. Send for my 44 page Art Catalog of THE WORLD'S GREATEST STRAIN OF WHITE WYANDOTTES. Please state wants plainly.

Chas. V. Keeler & Son R. F. D. 11 Winamac, Ind.

I advocated that specialty clubs be permitted to issue Standards for their respective varieties, paying 5 or 10 cents to the A. P. A. for each Standard issued, but instead the A. P. A. has steadily gone the other road.

"At my own expense I have secured information that leads me to believe the copyright the A. P. A. has on the Standard is worth nothing so far as describing breeds; furthermore, if their Standard copyright can hold, and no one else can describe a breed of chickens, then I know their Standard on Faverolles is an infringement on one I had copyrighted."

"The great American poultry breeder has suffered to be so now."

"The breed books are not what we want. We want a description of a single variety, not even of a breed, that can be given away by live poultry men and women."

"Let us educate the 'great majority' as Mr. Hewes says. Education is the keynote to civilization and progress, and, as before, let us get next to the little fellow back home. We must help the little shows and little breeders."

"Go to it, Dad. I am with you when it comes to increasing knowledge so that people will have understanding. We are told to get knowledge and wisdom but with it all get understanding. It may be necessary for the big poultry shows to spread the gospel, but where there is life there is hope, and I am assured that there is yet life (just a little) in the A. P. A."

The issue is now squarely before the specialty clubs themselves. At the annual club meetings this winter the members should raise the question of whether they will continue to silently assent to the A. P. A. monopolizing the Standard of their variety; or whether they will petition the A. P. A. to provide means of giving that Standard wider distribution.

The specialty clubs, in the past, have contributed to the making and revision of the Standard, and the time is now at hand when they should see to it that the Standard for the variety they champion is put into the hands of every new breeder.

The light of your variety should not be hidden under a bushel.

We know of no more important issue that should come before the specialty clubs at their annual meetings this year. A copy of any resolutions adopted should be sent to President Rigg and Theo. Hewes of the Standard committee.

* * *

Orpington Back Shape.

The following description for the Standard Orpington was recommended at the Seattle convention:

"Back: Broad, flat at shoulders, of moderate length; breadth over saddle nearly as great as between wings at shoulders, rising from the shoulders with a slight concave sweep to the tail."

E. F. Doty of New York brings this proposed description of the Orpington back to our attention and comments on the text as follows:

"In the resolution drawn up for proposed change in wording of the Orpington Standard I notice it is desired that the back, at base of tail, should be nearly as wide as between the shoulders.

"Is it not true that a very wide back is preferred, with practically parallel sides to the body when looking at the top of the bird?"

"If this is the case it seems as though the wording should be 'over the shoulders' or 'across the shoulders.' A bird with width of back as specified in the resolution would, I should think, be wedge shaped in top view, tapering considerably from shoulders to base of tail.

"We probably don't see many birds with good width of back and parallel sides but it seems as though that is what should be aimed at."

Mr. Doty is right in assuming that what is desired in an Orpington is a wide back; one that carries the width across the shoulders clear back to a broad tail. A back that is narrow or pinched in front of the tail is not desired.

Mr. Byers emphasized the importance of a good back in the Journal last month when he said that "more money had been paid for back shape than for any other quality in Orpingtons."

BUFF ORPINGTONS

The Big Golden offer Chicago Coliseum winning blood and quality on a basis which insures satisfaction. Here are full round breasts, long broad backs, and wide spread tails, along with Standard station and substance. The soft rich golden color and full lined massiveness with modern refinement makes success certain.

Big aggressive males at \$5, \$10, \$15 and \$25 each. Lithe active females of mellow form and matronly substance at \$4, \$7, \$10 and \$15 each. Approval and C. O. D. shipments. Correspondence and selection by Floyd Wyant.

Insure Your Fall and Winter Egg Crop

FEED SPROUTED OATS

The "SUCCESSFUL" Does It Easily, Quickly, Economically

Get the Facts About Our Grain Sprouter. Learn What It Has Done for Your Brother Poultry Raisers and What We Guarantee It for You

MAKE three bushels of fresh, green, tempting feed from one bushel of oats, wheat or rye. Turn loafing hens into money-making egg producers—have eggs to sell when prices are highest—get fertile eggs for spring hatching—all at a big saving in feed cost. Every poultry raiser should have a "Successful" Sprouter. Saves its cost in a few days' feeding and then keeps on saving money and doubling up your profits for a lifetime service.

Just what's needed in fall and winter to keep hens laying and needed again in the spring to make chicks grow into lively profit-producing birds. Write at once for complete 1922 offer. Sold on trial and pays for itself before trial runs out.

"SUCCESSFUL"

Grain Sprouter

**Practically All Steel—
Made in Sections**
New Safety Lamp Insures Doubly
Against Accident

Double steel walls—metal trays. There is nothing else like the "Successful" Sprouter. It's a brand new idea. Cannot be compared to wooden sprouters. It is warp proof—shrink proof—swell proof—nothing in it to rot—food cannot mold.

Made with glass doors. Each section a separate compartment. Start with just enough sections for your needs and add more as you need them.

Here is a money maker that proves its worth right at the

Test seed corn and start your plants the easiest and surest way with this Des Moines Grain Sprouter.

20 lbs. raw (3 pecks) oats as shown above makes 70 lbs. of sprouted oats as shown below in the "Successful" Sprouter

This in one week's time—the best green egg-making feed obtainable.

SPROUTED OATS

Read These Letters From Owners

Enjoys a 60% Egg Yield

Big Run, Pa., Jan. 20, 1920. Gentlemen: Have had splendid success with your Sprouter, Incubator and Brooder secured last season. Very few people secure eggs this winter, but I have been getting about 60% from my flock. I know this is due to feeding correctly sprouted oats. I think the sprouter is just wonderful.

Mrs. Jno. L. Kelly,
Box A25.

80 Hens Averaged Nearly 25 Eggs Per Hen for a Month

Salem, Ore., Apr. 5, 1920. Dear Sirs: Your sprouter is the thing. Would not be without one since I have seen how sprouted oats increases and keeps up the egg yield. One flock of 80 hens averaged nearly 25 eggs per hen for the month of March. Many are getting interested in it.

Harold F. Phillippe
2199 Fairgrounds Road.

start. It has increased egg yields 50 per cent—in some localities more. Takes only 15 minutes a day of your time. Sprouts oats in 24 hours and then grows an inch of crisp green sprouts every day. One feeding of sprouted oats at noon each day is all that's needed to increase the egg yield. And at the same time you cut your feed cost one-third and settle your green feed problem once and for all. Write for full details.

Write Your Name in the Coupon or on a Postal and Mail Today for Circular and 1922 Offer

We could show you scores of more letters like these, but why not show you the "Successful" Sprouter itself and let you see how it can save money and make money for you every day you use it. Famous booklet, "Proper Care and Feeding of Little Chicks, Ducks, Geese and Turkeys," 10 cents.

MANKATO, MINN.

Yet, strange to say, the Standard allots 8 points to shape of comb and 6 points to shape of back in Orpingtons. Again, comb is apportioned 8 points and size of the whole bird 4 points. Is it any wonder that beginners value comb above size or shape of back? Comb is given a higher value in Standard points than any other one section of the bird.

Comb is a secondary sexual character. Back, as Mr. Byers has well said, is the key to type merit. By all means the Standard committee should give the breeders an accurate and intelligent description of back.

As for the scale of points, they should be redrafted, so as to give the beginner a more accurate idea of the comparative values of the different sections of the bird. Comb is not the most important single quality in an Orpington. Yet the present Standard scale of points make it out to be.

* * *

The Fancier Still Lives.

All the talk of depression and liquidation in the purebred cattle and hog markets, all the talk of inflated prices and over-zealous field men may have an effect upon beginners, but the fancier-breeders of cattle and hogs and horses, the men who know the permanency of purebred values, are undismayed as witness the entry at the great International Fat Stock Show, which is 10 per cent bigger than ever before.

England is passing through one of the most severe financial strains in her history, yet at the Dairy Show, October 18 to 21, the winning White Wyandotte breeding pen was claimed at 60 pounds, normally \$300; the first Light Sussex cockerel sold for 45 pounds, normally \$200; another Light Sussex cockerel at 21 pounds, normally \$100; an Exhibition Game Bantam at \$50; a Golden Campine at \$50, and a R. I. Red and White Wyandotte pullet at \$75 each.

The entry at the Dairy Show in England was so heavy that entries for 600 birds had to be returned. Talk about classes! there were 113 Light Sussex pullets and 132 R. I. Red pullets.

And the way the reporters write up the big English shows! They set a model in freedom from patronage or pressure. The following comment on R. I. Reds at the Dairy, is from that foremost paper, The Feathered World, London, and will serve to illustrate the courage with which the English poultry press discharges its obligation to its readers in giving them a critical review of the classes:

"The Reds seemed to constitute almost a show in themselves, and, as usual, competition was exceedingly keen, especially in the single comb classes, which together brought an entry of 250. In cockerels we noticed a great variation in the shape of the placed birds, and it would appear from our observations at this and other shows that the R. I. Red judges are hardly attaching the importance to shape which, to our critical mind, appears necessary. The main faults appeared to be black ticking in the cockerels' hackles, ginger and light hackles and wing peppering in pullets, and ugly combs in both sexes. We were also struck with the number of exhibits having defective and in some cases deformed feet. It would seem essential in any breed, and especially so in a utility breed like the R. I. Red, that such physical defects should be rigorously stamped out, and from the discussion which we overheard whilst amongst the Reds—the Red alley here, as everyone knows, is a hotbed of criticism and excitement—it would appear that on this and many other matters the club judges are far from being of one mind. With no wish to interfere with matters which do not immediately concern us, we would advise the Red Club to come to some unanimity of opinion on these judging problems. We were not struck with any noticeable advance in quality as compared with last year's Dairy. The winning S. C. pullet is superior to anything seen at last year's event, but cockerels do not appear so good either individually or collectively. Rose-comb cockerels, on the other hand, show a decided improvement, while rose-comb pullets are quite a bit below last year's Standard."

It is gratifying to note that his royal highness, the Prince of Wales, as well as the Duke of Connaught, brother of the King, were exhibitors of R. I. Reds at the Dairy. In

99% raised in zero weather

Why is it that the wonderful work of the International Sanitary Hover has spread from coast to coast? Why is it that thousands who have had experience with practically every make and type of hover and brooder, are replacing them with the International Sanitary Hover soon as they know what it does? *Because the International*

Raises Better Chicks, Stronger Chicks, and a Higher Percentage of Chicks Entrusted to its Care than any Other Brooding Device Made.

This statement is based on the 10 years experience of thousands of users. It is not only a statement, it is a positive guarantee. Whether you raise 50 chicks or 50,000, the International Hover should interest you.

Here are the Facts About it.

The entire wall of the International Hover is a canvas curtain lined with a woolen substance. This curtain holds the heat in, but being porous, permits a continual circulation of fresh, pure air clear through the hovering space, without any drafts. The heated air (there is no direct heat) is circulated, by scientific principles, against the "ceiling," or dome, of the hover, radiating warmth down over the backs and bodies of the chicks. The heat is so thoroughly circulated that it is warmer at the edges of the curtain than near the center.

Results Due to Exclusive Patents.

There is no leg weakness, warmth comes from above. There is no smothering of chicks, due to impure air, because of the thorough ventilation through the canvas curtain. There is no loss of chicks from colds, because the curtain prevents all drafts. There is no crushing of chicks from crowding, because the circulated warmth keeps the chicks distributed all over the area, and the round construction makes it impossible for chicks to "pack" each other in corners.

There is no loss from lice or vermin because the International is metal throughout, and is circular.

The lamp is enclosed in a cell that is entirely walled

away from the chick area. There is no possibility of fire, smoke or oil getting into the hovering space.

Now you can see why the International makes such wonderful chick raising records.

The International Hover is being adopted by not only the family poultry raiser, but some of the largest poultry raisers of America. In addition to the superiority of the International Hover, as a hover, they have found that raising chicks in small separated units is far more practical than any other plan.

Simple As A, B, C, To Handle

When you set the International Hover down, you have set it up. No carpenter work is necessary. It is self-contained, light, and as easily carried from place to place as a basket. The entire heating unit lifts out by a handle from the top, for filling or cleaning—no stooping over to get it. A peep-hole on top shows you the condition of the lamp flame. You can pick out the thermometer from the top, and know exactly what the temperature is at the chick's level. The temperature is maintained unvarying by the automatic lamp.

Hundreds in the past have been unable to get International Sanitary Hovers at the time they wanted them, because the demand exceeded the supply.

Write For Booklet or Send Order.

Write at once for your copy of booklet "Better Than a Mother Hen." Or better still, place your order now with your dealer or order from us. Remember the new, low price is only \$13.50 complete.

L. P. Warren, Webster Groves, Mo., writes: "This will make 18 International Hovers for me. I have used 8 for over five years, and know there is nothing that will equal them."

"On March 12th I placed 106 under the International Sanitary Hover. The weather ranged from 2 or 3 degrees above zero at night to 20 degrees above during the day. I raised 99.6 of the chicks." (Name), Pittsburg, Kansas.

Kill the Rats New Easy Way

Amazing Virus Gets Every One.
Safe to Use. Not a Poison.

Rats, Mice, Gophers—in fact all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery, is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O., Check etc.) and we will ship you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting your's free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 706, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days, or your \$1.00 will be cheerfully refunded.—Advertisement.

Exhibition Coops of Niemann Make are best

Galvanized Iron Coops are positively sanitary and in purchasing such a coop you are rendering yourself a service that will pay for itself at one show.

Why run the risk of having your birds become infested with lice and mites when you can buy a galvanized iron coop that is positive proof against parasites? The same is true of every Niemann product.

Our products are all made substantially of galvanized iron, are easily taken apart and packed for removal and the prices at which we sell them make their purchase the most economical way of securing fixtures.

America we have the President, Vice-President and Secretary of Agriculture offering silver cups at the Washington, D. C., poultry show. In Holland it was the husband of the Queen who opened the World's Poultry Conference. In France, Premier Briand, the responsible head of the nation, whose only luxury in Paris is said to be a telephone—has a small farm on which fine poultry is a chief source of interest, and it is here that he spends his week ends. Purebred poultry has become worthy of the thought and personal interest of the governing heads of the nations. Anyone who writes a history of poultry culture should set down 1921 as an epoch making year in the attitude of nations toward the fancier-breeder.

Where Mr. Hayes Will Be.

Ed. L. Hayes, National Organizer for American Poultry Association, will attend the following poultry shows:

Mr. Hayes would like to meet as many poultry breeders as possible at the shows which he will attend.

Hamburgs and Polish.

The U. S. Department of Agriculture has published a bulletin of 28 pages, well illustrated, on the different varieties of Hamburgs, Polish, Standard Games, Sumatras, Malays, Sultans and Frizzles. The bulletin was written by Rob R. Slocum. Copies may be obtained free of charge by addressing Department of Agriculture, Animal Husbandry Division, Washington, D. C., and asking for Farmers' Bulletin 1221.

New Poultrymen in Illinois.

Following the authorization of a new division of poultry husbandry at Springfield by the Illinois legislature, C. P. Scott, well known as a breeder of Rhode Island Reds, has been placed in charge of the work.

Lester Elsworth Card, of Cornell University, has been appointed by the State College of Agriculture to the place made vacant by the death of Prof. D. O. Barto. Upon receiving his doctor's degree at Cornell, Feb. 1, Mr. Card will take up his new work in Illinois. It now appears that the great Prairie State, which has done less along poultry educational lines than any other leading agricultural state, is lining up to meet the demands of her poultry producers, and the appointments of Messrs. Scott and Card, for their respective fields, are selections that are meeting with general approval.

Oyster Shells Are Necessary.

According to a report published in the International Review of Science, an experiment has been carried on to determine the effect produced by grit, oyster shell and limestone with the ordinary grain and mash rations fed to poultry.

Calcium is the particular mineral element needed by hens, which is secured from crushed oyster shell and limestone. Calcium is needed to supply the lime substance that is secreted by the oviduct, which hardens and forms the shell of the egg.

From the experiments which were carried on over a period of six months, it was found:
(1) Laying hens whose supply of calcium is limited to that naturally contained in the food, continue laying until there is a general depletion of magnesium, phosphorus, and calcium in their bones and carcasses.

(2) As long as the hens permit the formation of an egg shell, the contents thereof remain reasonably constant, thereby allowing an average supply of calcium, magnesium and phosphorus sufficient for the normal development of the embryo of the chicken.

(3) Ten weeks elapse before there is any noticeable change in the general condition of

PROFITABLE LEGHORNS

Cockerels now ready for the poultryman who is breeding for eggs. Deep bodied, broad backed, chesty heavy combed, low built, sturdy birds—every one toe punched and range raised from our own Queensbury Special Pens of hens that have laid more than 200 eggs in the trap-nests.

Order direct from this ad now to get best selections and immediate shipment.

- 94 Cockerels (dams 200-226 sire 240-249) \$6 each, 6 for \$25.
- 42 Cockerels (dams 230-242, sire 250-259), \$7 each, 6 for \$35.
- 18 Cockerels (dams 246-259, sire 260-272), \$10 each.

Whenever you see this trade mark remember that Queensbury Leghorns are guaranteed to please you.

Won all 1sts at Chicago Coliseum 1920. Rich bay color. Cockerels, pairs and trios sired by noted winners. Write J. S. Pennington, Box A, Plainfield, Illinois.

hens receiving no mineral matter other than those naturally contained in the food ration such as that fed during these experiments.

(4) The lack of calcium is not the fundamental cause of the formation of shell-less eggs.

(5) The percentages of calcium and phosphorus in the bones of the hens in all lots were fairly constant, thus indicating a stable equilibrium between the two elements.

(6) The continued laying of eggs taking into account the calcium restrictions, does not materially alter the percentage mineral composition of the egg shells or their contents. There is, however, a gradual thinning of the shell.

(7) Under the conditions governing this experiment, the addition of limestone or oyster shell to the ration, increases the production of eggs 69.4 per cent as shown by the average production of Pens 1 and 2 when compared with that of Pens 3 and 4.

Back to the Fundamentals and First Principles of the Standardbred Bird.

Arthur O. Schilling, gifted artist, keen and conscientious judge, and highly successful breeder, has recently taken up White Leghorns, and, forming a partnership with his brother, B. O. Schilling, has equipped a farm to carry on their breeding. After a preliminary try-out at the Rochester show last winter, A. & B. Schilling attracted national attention by winning in the strongly contested classes of 233 S. C. White Leghorns at the New York State Fair in September, as reported in the awards of that fair. In a recent letter Mr. Schilling writes:

"Have read your recent report of the New York State Fair relating to leg color in white breeds and heartily concur in your views as expressed. Personally I believe there are altogether too many strains of white birds wherein the leg color is being neglected. It seems to me that since the State Educators are telling poultrymen that a pale leg is an indication of a prolific layer, breeders are not laying stress upon a good colored shank when selecting their choice birds for the breeding pens.

"In my opinion, this matter of pale shanks is largely theory and cannot, or has not been absolutely proven, and I take it with as much consideration as I did the earlier statements, made only a few short years ago, that the real layers were high tailed, fleshy combed birds. Today this ridiculous theory is exploded; and the so-called fixed egg type is also becoming an uncertainty as well. I believe that a good normal type bird is the bird that will lay and there are many variations of normal types in poultry. Some may be classed as a bit short legged as compared to one Standard while others may be regarded as too blocky as compared to another ideal. The simple fact remains that a good, normal, healthy, well-matured bird will lay well, provided it has in its blood lines birds that have laid large numbers of eggs, and the birds themselves are individuals that have inherited healthy and prolific egg functioning organs.

"A careful breeder can stamp this characteristic into his flock to a reasonable extent, but by no means can he expect that each individual will inherit these qualities 100 per cent perfect, any more than we can expect show birds to come from a certain mating and have each one of them a winner.

"This is exactly what Harry Lamon has accomplished, and his common sense principles of breeding as applied to our Standard type Leghorns have proven that our present Standard is a normal and sensible Standard. I think Mr. Lamon is deserving of a lot of credit for placing before the public the authentic facts and accomplishments in his department at the Government Farms at Beltsville, Md.

"I am really very happy over the fact that you took this matter in hand through A. P. J. and have given it this splendid publicity. The critical statements made by some men against the Standard Leghorn have been unjustified and uncalled for, and I predict that the day will come when they will be looking for birds of Standard shape as foundation stock.

You Can Get More Eggs

Little Putnam Stove keeps water unfrozen—not hot.

Over 90% of the Egg Is WATER

Give your fowls all the pure *un-chilled* water they can drink, and watch them shell out the eggs. One of my Little Putnam Stoves will keep enough water unfrozen to supply 30 or 40 fowls, even in the coldest weather. This Stove holds 3 pints of oil—requires no attention except a monthly filling, due to my patented burner. It's fireproof and non-explosive—can be operated anywhere. You can run it all winter at a cost of from 20 to 30 cents. You'll get enough *more eggs* the first month to pay for it.

Little PUTNAM Stove

\$2.00
Postpaid

Little Putnam Stove

can also be used as a heating unit for an easy-to-make and easy-to-operate Oat Sprouter. Full directions for making the Sprouter are packed with every Little Putnam Stove, or I will mail a set free and promptly if you will request it, and send your dealer's name.

GUARANTEE—I guarantee the Little Putnam Stove to give satisfaction, or it may be returned in ten days and the money paid for it will be promptly refunded. Most dealers keep it. If yours does not send me his name and \$2.00, check or money-order, and I will send you a stove post-paid.

NOW-AT LAST!

—the Supreme Line of Poultry Feeds

Answering a Nation Wide Demand

For years feeds mixed according to my formulas have been used by myself and many others in feeding for Egg Production Records. Thousands have urged me to manufacture these feeds in quantities for general distribution. This has been done and now these feeds are offered to poultry raisers throughout the country.

"Quisenberry Quality" is the registered name given to this line of Laying and Growing Mash and Scratch Grains made under my personal supervision.

If your dealer hasn't Quisenberry Quality Feeds as yet, write me, giving his name and I will see that you are supplied promptly.

T. E. QUISENBERY, Pres.

POULTRY Raisers everywhere have made possible QUISENBERY QUALITY Poultry Feeds. For years T. E. Quisenberry, President of the Quisenberry Feed Mfg. Co., has stood in the first rank of Poultry Authorities. His practical experience in feeding for big egg yields and developing strong husky chicks has made his work known in every state in the Union and many foreign lands. His feed and feeding methods have been in demand everywhere.

A complete line of Poultry Feeds based on Mr. Quisenberry's knowledge and experience is now being distributed. Poultry Raisers are assured feeds of the highest quality at no higher cost than is asked for ordinary brands.

QUISENBERY QUALITY

POULTRY FEEDS

From Chick to Laying Hen

Specially made to develop husky chicks. Makes 'em grow fast and brings them into laying earlier. Keeps them healthy—richer in body building nutriment. Just the right elements properly proportioned to produce lots of eggs at a big saving in feed.

Use Coupon Opposite

Order your supply of QUISENBERY QUALITY Buttermilk Laying Mash at \$2.75 per 100 lbs. Start using this wonderful feed without delay. This Feed Made One Hen Lay 306 Eggs in 12 Months. Entire flocks average over two hundred eggs per hen per year.

FREE BOOK, "How to Get Big Winter Egg Yields" sent to you postpaid on request.

This is the Quisenberry Mill. More than 30,000 sq. ft. of floor space. Completely equipped with most modern milling machinery producing Quality feeds at lowest cost.

FREE A Feed Hopper With Every Sack of this Feed

For 30 Days Only!

To introduce QUISENBERRY QUALITY Buttermilk Laying Mash to a host of new friends and poultry raisers, a Galvanized Feed Hopper will be included with each 100-pound sack—Price \$2.75.

The Feed

The Hen

The Result

"I Guarantee Twice As Many Eggs If You Use This Feed"—T.E. Quisenberry

QUISENBERRY QUALITY Buttermilk Laying Mash

Made of purest, richest buttermilk in powdered form, scientifically mixed with selected feed stuffs, correctly proportioned. Produces an equal number of yolks and whites. Improperly mixed feed makes more yolks than whites and the result is hens become overly fat and will not lay. Poultry experts themselves feed Quisenberry Quality Buttermilk Laying Mash. It makes egg-laying records and is unfailing in results. The best possible mash for moulting hens. Starts pullets to laying earlier. Good conditioner for show birds.

Better Feed and a Better

Way to Feed!

By ordering a 100-lb. sack of this feed you will be sure of eggs in coldest weather. The Free Feeding hopper will keep the mash before your hens all the time. They will eat just what they want. Convenient and economical way to feed.

Clip the Coupon and take it to your nearest Feed Dealer or Grocer. If he can't supply you as yet, order direct from us and delivery will be arranged.

Postpaid, State breed and sex; also Colored Numbered Bands. Circular free. AURORA BAND CO., 77 N. La Salle Street, Aurora, Ill.

"When I selected our breeding hens from which to lay the foundation of our present flock of S. C. White Leghorns I can assure you that I had the Standard ideals in mind. In my opinion, half a job is no job at all, and a thing worth doing at all is surely worth doing just as well as it possibly can be done.

"Those two winning pullets of ours at the recent New York State Fair are fairly running a race just now in laying and they have been at it ever since the week following the State Fair.

"I know you realize that such a fine, big pullet as the second winner especially, is bound to be a good layer, unless her mother was an absolute drone and in this case I know what a layer her dam was. She is out of our first Rochester pullet last year and she is a wonder and a very prolific layer. Really Frank, some of those old Dan Young hens which we have, and they are now about 8 years old, are still laying fairly well, considering their age.

"We lost one of them this fall simply because she persisted in laying right into the molt and then the strain was too much for her at her age.

"This Leghorn question as it stands today is a most important one and it behooves our best breeders to hold fast, or some of the new comers will undo all the good work that breeders like Dan Young, Frank Davey, and others have worked hard for, for many years.

"I am tempted at times to write an article for you on a few of the theories and proposals respecting utility type in Leghorns. The question of length of feather is a most important one, and I know it cannot be proven that short feather is correlated with production as a positive principle in the practice of good breeding."

Another letter from another authority on purebred poultry is at hand. Its writer, W. H. Card, is widely known as secretary of the Rhode Island Red Club of America, but those who know the old student best, know him as the Sir John Sebright of America.

The famous Briton, more than a century ago, made the bantam which bears the name of Sebright. Wonderful lacing, distinctive type and small size are its properties.

Definite lacing, a type as distinct and full of character, and large size are the qualities of Mr. Card's creation, the White Laced Red Cornish.

Mr. Card's Cornish are very short in feather, yet Mr. Card would laugh if anyone should suggest that shortness of feather in itself would indicate that his birds were better layers than Leghorns. He knows, with Mr. Schilling, that there are racial characters in breeds, that if the racial characters are ignored the breeds will break down, and that normal development of breeds along racial lines brings out the best that there is in them.

It follows, therefore, that the Standard may describe decidedly different types in different breeds, yet each type may be made to prove of true worth without radically changing it. This point is brought out in the following letter from Mr. Card:

"Just received my November Journal and found the article on Lamon's White Leghorns. Glad indeed, am I that you are recognizing them in the manner that you have, and as you so well know how to do.

"It seems like dreams coming true. For years it has been my honest belief that such an accomplishment were possible and practicable, not only with Leghorns, but with any and all breeds if only fanciers and breeders would endeavor to develop the combination of fancy and utility. My feeble say-so has amounted to little, yet believing truly that merit will assert itself, I have had no misgivings of the ultimate trend, even when doubters assailed, ridiculed and combatted the idea; and I have patiently waited for this hour.

"Although for some time I have known of the superior birds at the Government farm, and how well they fitted the Standard in every requirement, as well as in egg records, I feel that the show down has come and that it is a splendid victory.

"Reading further in your November issue, I find where Thos. F. Rigg is proving his metal as a true fancier in arranging to have

Tells how to properly choose fowls, incubators, chicks, feed and PURE-BRED BABY CHICKS. This practical book worth dollars mailed for 10 cents.

Gerry's Poultry Farm, Box 116, Clarinda, Iowa

these splendid and true representatives of Standard Leghorns set before the Revision Committee at Indianapolis. Sufficient will be this array of simon-pure, bona-fide family of Leghorns to squelch every murmur of the ultra-utilitarian for an egg machine, regardless of type and color. There will be no need of heavy arguments, just a show of the goods; that's all.

"I have spent the active years of my life in the movement to elevate our fancy poultry and pure breeds in general. Now I watch from the side lines, voicing encouragement which is never amiss, praying for success for every move along right lines, and waiting for results anxiously, yet feeling sure that with such breeders as Lamon, and others no less positive as regards the combination of fancy and utility, that our Standardbred poultry will reach heights of usefulness and beauty yet undreamed of.

"Again I must voice my extreme pleasure for the recognition that you have given the Government work. It marks what is really a turning point in the progress of poultry culture, for its great betterment.

"What Lamon has done can be done by other breeders, who possess the same determination, zeal, intelligence and persistence."

Smaller Minorcas.

W. B. Gregg of Ohio writes:

"Have recently been confronted by the statement from two or three parties in my canvassing for pullets, that there were two types of Black Minorcas, large and small, and that the next Standard would admit the smaller type. Now, I always carry the Standard of Perfection with me on my buying trips for my own benefit in selection and also to settle any difference of opinion that may arise over the selection of stock, but even this does not seem to clinch this matter this time; and the flocks I have in mind conform more to the Leghorn type, with the Minorca characteristics of black legs and white skin, and the weights run about 5 lbs. for a matured hen.

"I am interested in poultry as a raiser, buyer, and lover of the purebred fowl, and a statement from someone in authority would set matters right, as to present weight and also future weight."

The standard weight for S. C. Black Minorcas are: cock, 9 lbs.; hen, 7½ lbs.; cockerel, 7½ lbs.; pullet, 6½ lbs. The weights for other varieties of Minorcas are 1 lb. lighter. The likelihood is that all varieties will be Standardized on the same weight basis in the new Standard, as the Buff Minorca men have already requested that the weights of Black Minorcas be applied to Buff Minorcas.

If anyone wants a small Minorca, they should breed the Leghorn, which breed provides Black, White and Buff varieties in both single and rose combs. There is nothing to the notion that the new Standard will call for lighter weights in Minorcas than are now required. The tendency is the other way. Those who have light boned stock should turn a deaf ear to hucksters and hatcheries that are talking light weights, and spend some money for size and substance, thus improving their stock.

* * *

Accepts New Position.

Walter C. Young, who made a notable success in breeding the beautiful three-color Speckled Sussex at Moraine Farm, Ohio, has taken a position with James Mfg. Co., Wis. The James company are large manufacturers of barn equipment, including barn ventilation systems. Mr. James, himself, is an enthusiastic breeder of Buff Leghorns. The James company contemplates going into the poultry equipment field. Mr. Young will serve in the capacity of contact man with poultry breeders.

Pea Comb Jersey Black Giants.

Marcy Farms, New Jersey, announce a new pea combed Black Giant. This change in comb character will give a distinctiveness to the birds and remove them from the objections and criticisms of the Black Java breeders.

Oat Sprouter \$2.49

THIS HOME-MADE oat sprouter was made in one evening by a 14-year-old boy with no tools but saw and hammer. The total cost, including stove for heating, was \$2.49. Thousands of these sprouters have been made at home by poultry keepers, and hundreds of letters in my files testify that it is the cheapest to make, the easiest to operate, and the handiest and best sprouter ever built.

Make Layers Out of Loafers

To make hens lay abundantly in winter you must feed growing green food that is rich in vitamins. Sprouted oats furnish the best of such food at lowest cost.

The Putnam Home-Made Oat Sprouter will supply better and sweeter sprouted oats with less fuss and dirt and work than any other sprouter made. I will send you, free, easily followed plans for building this oat sprouter together with a full description of the Little Putnam Stove with which it is heated. The price of the stove is \$2 postpaid. Plans for building the Sprouter are packed with every stove, also instructions for using the stove to keep the water in poultry fountains from freezing.

You can't afford to be without this oat sprouter, even if you keep but eight fowls. Get a Little Putnam Stove from your dealer now. It will pay for itself many times before Spring. Most dealers keep it. If your does not, send me his name and \$2, and I will send you the stove, postpaid. Try it and if you do not find it all I claim and are not perfectly satisfied, send it back in 10 days and I will refund your \$2, together with the postage for its return. I'll run all the risk.

BUCKEYE

Assurance of profitable poultry raising is found in the use of Buckeye Poultry Raising Equipment. The test of over thirty years in the hands of experienced poultry men and of beginners has made this equipment stand out pre-eminent as the sure way to better profits.

BUCKEYE THE PERFECT INCUBATOR

BUCKEYE Incubators occupy their foremost position because of merit. They have proven by experience that they **CAN AND WILL** hatch every hatchable egg. More than that, the automatic heat and moisture control results in better chicks--big, sturdy, vigorous baby chicks--started right--toward quick maturity.

These facts are established in the minds of successful chick breeders everywhere. A million breeders in all parts of the world depend on Buckeye equipment because the most convincing of teachers--**EXPERIENCE**--has taught them the value of the Buckeye.

Whether you use the little 65 egg incubator, the Mammoth 10,368 egg size or any of the convenient sizes between, success is certain because each Buckeye is correct in design and uniformly efficient.

Buckeye Standard Incubators **ARE GUARANTEED** to hatch every hatchable egg and to produce bigger, stronger and healthier chicks--the kind that grow to quick maturity because they are started right.

the way to better profits

ALL that Buckeye Incubators have done for hatching, Buckeye "Colony" Brooders do for raising. Literally, they make three chicks grow where one grew before, reduce the labor to a fourth and cut the expenses in half.

BUCKEYE COLONY BROODERS

These brooders have revolutionized chick raising, entirely removing the great mortality that made brooding so hazardous, and raising every chick, barring accidents, to quick, profitable maturity.

They are sold under a guarantee of perfect satisfaction or the money back.

Buckeye Brooders are coal-burning, gas-burning or oil-burning in the colony sizes; lamp-heated in the smaller units.

Reasons for this superiority are set out in full in the illustrated catalog, which shows sizes and prices, and will be sent free on application to the factory. Those interested in brooding should ask especially for the new booklet, "The Revolution in Chick Raising."

These same reasons will be fully explained by any one of the 10,000 Buckeye dealers in all parts of the world. Get that catalog, see wherein Buckeye superiority lies, and put your chick raising this season on a sound basis.

Plan Your Hatching Now for the Coming Season

YOUR next season's profits may depend on good hatches of **STRONG, STURDY** chicks—the big, well-hatched kind that make vigorous, healthy and profitable laying and breeding stock. Our Cycle method of hatching insures you the **BEST QUALITY** chicks; normally developed chicks that equal hen hatched chicks in every way and with the advantage of hatching whenever you are ready, freedom from lice, and with **LESS** expense.

The Cycle nest or egg chamber is round like a hen's nest, and scientifically heated from above and around the eggs, closely duplicating the condition's of actual hen's nest.

Perfect ventilation system retains the natural moisture of the eggs—they are not dried down as in some incubators—with the result that bigger hatches and better chicks are obtained.

Regulation of heat is automatic, controlled by an accurate regulator. The long burning safety lamp needs filling only once or twice during a hatch and will hatch 50 eggs on two to four quarts of oil.

We are also headquarters for Philo System "Ready-Built" Laying houses and Brooder Coops, and a complete line of poultry supplies and appliances.

Write for catalog containing many suggestions about new methods of poultry keeping that will interest you by showing how you can bring more chicks to maturity with less work, less time, less expense and greater profits. Sent free. Write today.

Cycle Hatcher Co., 103 Philo Building, Elmira, N. Y.

Costs less to operate than to feed setting hens. Hatches hens, ducks, geese, and turkey eggs equally well.

The all-metal construction is fire-proof, durable; will not warp, swell, shrink or crack. It is the lowest cost Hatcher of equal quality—only \$9 for 50-egg machine.

Our combined Brooder-Hatcher is a 50-egg capacity Hatcher with a Brooder Compartment, that can be used at the same time—one lamp serving both purposes. Price \$11.

Both styles can be delivered by parcel post at slight extra cost.

History and Development of Light Brahmas.

(Continued from page 1039.)

has described as Dr. Bennett's 'pure Brahmas.' In breeding these, many different shades of color were produced, the most objectionable being pure buff, with the exception of a penciled neck, as fine a color as we see today in Buff Cochins. These retained the Brahma form and the pea-comb, and very many of them were the largest birds. Deeming it best to keep these out of the stock as much as possible, and finding they were all bred from the whitest birds (those with dark or lead colored under-feathers not breeding buff), I selected those with fine penciled necks, black tails, primaries of wings as nearly black as possible and lead colored underfeathers nicely covered with white."

Thus we see the early breeders, including that conscientious and painstaking fancier, C. C. Plaisted, giving form to the breed, and in the description above quoted we find the elemental characters of the modern, purebred Light Brahma.

Standard Light Brahmas.

The development of the Light Brahma in shape and color characteristics into the finished modern Standard male and female, covered a period beginning with 1847 up to the time of the last general revision of the Standard. Shape or type developed more rapidly into the Standard ideals that conservative and clear thinking breeders and fanciers believed to fit the characteristic body conformation of the Brahma male and female, both from an exhibition standpoint as well as in respect to utility properties.

This standardization of the breed type, however, was not secured without a struggle, for there were type faddists in by-gone days the same as we will find today. More or less mythical egg or utility types were favored and exploited thirty or more years ago in the poultry press. On the other hand extremists lost sight of shape to a great extent while breeding for color, some going also to another extreme by Cochinating the breed in order to attain great loose feathering as well as larger apparent size, although not heavier weight.

English fanciers went even a bit further by permitting vulture hocks to destroy the clean cut, smooth hock lines of the true Brahma. The English Poultry Club Standard opens the door for the heavy feathered faddist when it allows "profuse leg and foot feather without vulture hock as desirable."

Well feathered legs and feet, and not profuse feathered ones are characteristic of the Brahma, which the American Standard describes as being "of a distinctive type, unlike the Cochins in form and feather, being more compactly and firmly put together." The illustrations of the modern male and female printed in connection with this article, clearly show the characteristic shape and smoothness or hardness of feather. To add even small vulture hocks to such finely formed males and females would make monstrosities of them, destroying the symmetry of the whole bird. The full feathered English Cochins with its extreme vulture hocks did more to destroy the prestige of the Cochins fowl than any other fad we have ever known to exist.

Standard Types of the Past.

The late I. K. Felch played an important part in the development of the Light Brahma. Like Mr. Burnham, Uncle Isaac Felch was a booster of the Light Brahma. As a publicity agent he ran a very close second to the famous author of "The History of the Hen Fever." Felch was not only one of the leading all-round judges of his day, but a prolific writer on poultry subjects. In January, 1874, the Poultry World published a Standard for Light Brahmas, drawn up by I. K. Felch, accompanied by illustrations to clearly define his conception of what the type of a Brahma should be. He practically adhered to this type until his death for he was firmly convinced of its fitting the breed he so strongly admired and promoted.

The "back" of the Brahma was Uncle Isaac's "long suit." The Felch-backed Brah-

Artificial Light in the Poultry House

has increased the egg production of some flocks as much as **100%**

GEORGE NEWELL discovered that by the use of artificial light in his laying pens during the early morning and evening of short days, he doubled his egg yield. He put the results and methods of his experiences into a book called

A Revolution in Egg Production

This book is not a collection of clippings and theories like so many poultry books, but contains the results of common-sense ideas which have been put to test and found practical. They do just what they say they will do—**increase the average egg yield 100%.**

It is profusely illustrated and contains chapters on Care and Feed in General—Balancing the Ration—Conditions Should Be Watched and Noted—What to Feed—Underfeeding—Overfeeding—Automatic Feeders—Fussing vs. Economy of Time—Water Problems—Housing, Ventilation and Light—Trap Nesting—Incubators or Hens for Hatching—Brooding Problems—What Breed?—Meat Production a By-Product—Yards and Exercise—Spring and Summer Eggs—Fall and Winter Eggs—Care of Eggs—"Ask the Birds; Their Judgment Is Good"—Production Under Present Conditions—Production Records.

Cloth bound, 112 pages, handsomely illustrated, postpaid, price \$1.00

Hundreds of Poultry Secrets Outlined in this NEW FREE BOOK!

"A Family of Five Can Live on the Work of Fifty-four Hens. That Sized Flock Will Pay the Bills of the Family and Permit It to Live Decently," said a practical poultry raiser before the U.S. Commission of Unemployment. Read the clipping reproduced here.

average Don't know where to get them.

HENS MAY SAVE AMERICA.

Egg Layers Don't Know There Is a Business Depression.

From the Detroit News.

The fact that there is a business depression has not yet penetrated to the hen yards of America. As far as the hens are aware, there has never been any interruption to normalcy, says the poultry experts, and if you give Milady Hen a decent place to scratch, a little something to scratch for and a drink once in a while, she will come through with her egg just as regularly as she ever did.

At the recent unemployment conference at Washington a farmer from North Dakota, who is also a recognized authority on agricultural economics, testified that a family of five can live on the labor of fifty-four hens—that the eggs and spring fries from that sized flock will pay the bills of the family and permit it to live decently.

But poultry raising is not hard to learn, they say, and anyone who is willing to devote a little time and care to the subject can capitalize his backyard, and assure himself fresh eggs with his bacon—maybe also the bacon.

Geese once saved Rome, why not hens America?

Simple Methods Guarantee Success

To enjoy this success, you must treat your hens right. There are real secrets you must know in order to avoid loss of money and time and disappointment. You must know these secrets and know how to apply them. T. E. Quisenberry, one of the world's most successful poultry raisers, outlines all anybody need know in his new book, "Dollars and Sense in the Poultry Business", sent free to readers of this publication. This book is based on 25 years' actual experience and covers a multitude of subjects, among which are the following:

- How to Get Eggs in Coldest Weather.
- How to Get More Eggs and Save Feed.
- How to Call Out Non-Layers.
- How to Tell Poor Layers at a Glance.
- How to Tell Good Layers at a Glance.
- How to Tell Males or Females that Breed Good Layers.
- How to Prevent White Diarrhoea and Bowel Trouble.
- How to Feed Chicks from Start to Finish.

RELIABLE Standard INCUBATOR

It is today as it was at the beginning, 41 years ago—the leader of them all. In every way first class; best materials are used; best workmanship. Double heating system; maintains uniform temperature with a constant circulation of pure air. Has ample nursery space. Like all Reliable Poultry Appliances and Equipment it is sold upon honor and gives absolute satisfaction.

The Reliable Standard Blue Flame Wickless Oil Heated Colony Hover

the latest achievement and a dominant leader. It is made right, works right; automatically controlled; flame adjustable to heat required. Chicks have fresh air and even temperature. Our canopies are shipped complete, not knocked down. They are ready to attach legs and operate.

RELIABLE COAL BURNING BROODER universally recognized the best. Burns either hard or soft coal. Self heating; easily cleaned; economical; gives steady, automatically regulated heat. Our positive money-back guarantee applies to all Reliable Incubators, Brooders, Hovers, Poultry Appliances and Equipment.

If there is not a Reliable dealer in your locality, write us for Sales Book.

ma was his ideal of type, for as he described it in the Poultry World: "Broad and of such length and profusion of saddle feathers that in conjunction with the lower parts of neck and tail, it shall form an outline with that of a Brahma egg, the large end toward the neck."

When we edited the Fanciers' Journal, Philadelphia, Pa., 1895, Mr. Felch contributed an article on Brahma type, illustrated with two pictures showing the Felch male and female at that time. We reproduce these illustrations at this time.

Mr. Felch was one of the keenest thinkers and most potent forces of the last century, and the Felch-back type ideal as exemplified by him, of the under line of an egg affording the correct outline for the back of the male is still in evidence. Of this male, which had won 1st at Columbus, Ohio, Mr. Felch wrote: "He is entirely free from characteristics other than Brahma, is smooth in plumage of thighs, with close turned hocks and properly feathered shanks and toes. Each lesser sickle, or side hanger, as many term them, reaches just even with and completely hides the tail proper in a strictly side or profile view. He has the true slight concave line from point of keel bone to in front of thighs. His neck with cape gives us that curved and downward slope to the 'oyster' just in front of hip joints where the saddle commences and carries the concave line of the same to the tail. The wings are carried high enough to give a flat cape or back at base of hackle; in fact a Brahma all over that does not divide your attention with any other breed. The broad skull, overhanging brows, short well-arched beak and proper arch of hackle and slope of back that has been handed down to us as landmarks of the shape of the breed since 1868."

Of the correct female type shown in the same illustration, Mr. Felch pointed to this female as his "ideal of a pullet, seven months old, being in full muscular development, void of fat."

By many breeders the Felch type was held to be too extreme in length of leg; by others it was considered far better Brahma shape than some of the more favored winning types found in the showroom in later years.

When we bred Light Brahmas in 1883 we remember the type as being like the Felch male but not like the Felch female. The pullets and hens were longer in back with less concave sweep, much more like we find in good specimens today. But in color points they were far inferior, especially the tail coverts and wing-flights. They were less strongly striped and not so finely laced as the modern Light Brahma.

It was not until 1890 that real progress was made in the color markings of Light Brahmas.

It remained for George Purdue, florist and Brahma enthusiast to start the development of finer color ideals in the tail and neck sections.

When Mr. Purdue exhibited the pullet "Progress" at the New York Show in 1890, her wonderful tail and laced coverts proved a revelation to Light Brahma breeders and fanciers.

In 1902 he exhibited a Light Brahma cockerel at the Madison Square Garden with the most remarkable laced coverts seen up to that time. The two illustrations by Franklane L. Sewell, reprinted with this article, will convey more impressively what these advanced patterns of color markings were like, than any word description; and the advances of Purdue are all the more pronounced in contrast with the pictures of earlier birds.

Light Brahma fanciers present at the New York Show when the pullet "Progress" made her appearance in public were quick to recognize the remarkable color characteristics possessed by this bird of the hour; even if the older judges failed to do so.

The advancement made in the hackle and tail sections of Light Brahmas progressed rapidly from that year on. George Purdue was as particular about the ideal neck or hackle striping and lacing as he was with the tail coverts. He was an idealist who attained his ideals by the exercise of keen judgment in mating combined with unlimited patience; a Luther Burbank in the feathered world, so to speak.

Brahma type.

When the Hon. George B. Loring inspected the Brahmas at Framingham, Mass., in 1863, he remarked: "They were an oblong band-box on legs." This remark was evidently overheard by I. K. Felch, who after that insisted the true Brahma was oblong in appearance, which made the females the great laying fowl they have proven to be. But the gradual evolution from the leggy bandbox type into more attractive Felch shape, and finally into the refined lines of the Standard Brahma of today, is one of the most glorious achievements of American breeders and fanciers in the history of standardbred poultry culture.

It has been our privilege as well as pleasure to have spent many hours in the show-room with Brahma exhibitors and fanciers during the past thirty or more years. The unfinished Brahma we bred and admired and found so useful nearly forty years ago, has gradually disappeared; a greater and finer and equally useful Brahma has taken its place.

The illustration of a modern Light Brahma cockerel reproduced from a photograph by Franklane L. Sewell, faithfully presents the shape and color characteristics of a young male which, although shown some what unfinished at Boston and New York in 1921, nevertheless was an outstanding specimen among many other fine males exhibited at these great shows. Artist Sewell has posed and portrayed this cockerel beautifully, every section being brought out so completely as to present an ideal Brahma male in type, color and head points. The utility of the bird is also clearly indicated by the strong frame, bone, beak and wattles, with broad crown topped off by a well developed, shapely comb.

The modern Light Brahma hen illustrated is reproduced from a pen drawing by Artist Megargee, of the first prize hen at Madison Square Garden last winter. The modern standard color markings of neck and tail are to be found most remarkably strong and fine in this large and well balanced female.

It is through courtesy of Harvey C. Wood, Secretary of the American Light Brahma Club that we are enabled to present the two illustrations referred to above.

As the revision of the American Standard of Perfection is to be made during the coming year, Light Brahma breeders and fanciers are naturally interested in prospective changes which may be suggested. We asked Secretary Wood if he had illustrations of a male and female Brahma which, in his opinion, represented the modern type and color of the variety. He handed us the picture by Mr. Sewell, expressing the opinion that the portrait of this modern cockerel approximated the ideals in shape and color favored by him and other breeders.

If this is correct, and we believe it to be so, the male illustrated in the present Standard falls short of the ideal in head points and shape of back, the former exhibiting smaller comb and wattles and slightly shorter back. The saddle stripings of the present Standard male are not as numerous or pronounced as those shown by the modern New York cockerel. This quantity of saddle striping, however, is a moot question, one on which a division of opinion exists among Light Brahma fanciers.

Regarding the Light Brahma female, we have considered and still consider the Standard illustration by Sewell, ideal in shape and color, in fact, believe it to be the finest portrait of a Light Brahma hen ever executed and printed.

Electric Lights for Poultry House.

It is not as profitable to operate lights on yearlings or two-year-old hens as it is on pullets, although where they are not used for breeding they will respond in a remarkable way to the use of lights in the early fall and winter, the idea being to get all the eggs out of them if possible during the period of high prices, and then when they break production in the early summer, to market them for meat.

The use of artificial lights on culled hens to get a fall and winter egg production is quite generally practiced, although there is grave question as to whether it would not be wiser to sell these culled hens and fill the pens which they would occupy with well-bred birds.

Make Your Food Medicinal By Mixing With The Feed.

The Barker Products are guaranteed remedies, and are made from the finest drugs obtainable.

BARKER'S

SPECIAL

Poultry Remedy

Mix it with the feed—we absolutely guarantee that it will do your chickens a world of good—or back goes your money. Comes in 12 ounce, 24 ounce and 4 lb. cartons—25, 50 and 100 lb. bags—12 and 25 lb. pails.

BARKER'S ANIMAL TONIC

A carefully prepared medicine, made of the very best drugs. Back of it is 70 years' experience with Horses, Cattle, Hogs and Sheep. In 6 lb. cartons—12 and 25 lb. pails—12, 25, 50 and 100 lb. bags.

BARKER'S NERVE AND BONE LINIMENT

Good for man and beast—and an unfailing remedy for sprains, bruises, rheumatism, chilblains, stiff and weak joints, chafes, galls, wounds, cuts, etc. And it's only 35 cents a bottle.

Egg-Laying Tonics

Opinions of Fishel, Keeler, Tormohlen, Judge Young and Other Authorities.

Various opinions have been advanced concerning egg-laying tonics. The general opinion seems to be that anything that "forces" the hen works against nature. However, a tonic can be beneficial by building up the hen's health, and giving nature the help she often needs.

Authorities agree that Don Sung Chinese Egg-Laying Tablets are both beneficial to poultry, and productive of more eggs. The first effect is to make the hen strong, active, and healthy, in any weather, cold or wet. The result is eggs, right through the winter. Wonderful results, almost amazing results, have followed its use. The best proof of its merit is that it is endorsed and used by the most prominent authorities in the poultry industry.

"There is no doubt in my mind that Don Sung is a sure, safe, scientific way to get more eggs. Once it is used, by a poultryman, it will always be used," says Judge Walter C. Young, of Dayton, Ohio.

"Thirty of our White Plymouth Rocks had let down on egg production," says U. R. Fishel, the famous breeder, of Hope, Ind. "They were laying 2 eggs a day before we began feeding Don Sung. In 30 days, they were laying 22 to 24 a day."

"Last winter, with the temperature at zero and 15 and 18 degrees below, I gave Don Sung to 30 hens as a test," says Chas. V. Keeler, A. P. A. Judge and breeder of White Wyandottes, Winamac, Ind. "In two weeks, these 30 hens that had been laying nothing, were laying 21 eggs a day, and have been among our best producers ever since. Hatching results from their eggs have been way above average."

H. V. Tormohlen, breeder of "Everlay" Strain Single Comb Brown Leghorns, and associate Editor of Leghorn World, writes: "I tried Don Sung last winter. I am sorry I did not do it sooner. I confined its use to 25 of my Brown Leghorns during the very cold part of winter. In about 10 days these 25 birds were laying 11 eggs a day, and in three weeks they were laying 19 to 21 eggs a day, and they kept on laying through our coldest winter. Don Sung not only gets the eggs, but also builds up and benefits the hens."

The Sunbrier Farms, Grosse Pointe, Mich., breeders of prize-winning Sunbrier Partridge Wyandottes, says: "Don Sung should have a place in every poultry plant to assure fertility and to start the heavy laying earlier. All our birds that received Don Sung last winter and early spring are in the best of health. During show season we shall add Don Sung to the conditioning feed for our winners."

Hundreds of other letters, just like these from leaders in the poultry industry, prove conclusively the genuine merit and real need for Don Sung. Men with their standing would not endorse or recommend any article of unknown or doubtful value.

Don Sung is a product of The Burrell-Dugger Co., 301 Columbia Bldg., Indianapolis, Ind. It is sold in three sizes—50c, \$1.00 and \$5.00—by druggists and poultry remedy dealers everywhere. It is positively guaranteed to pay for itself and pay you a good profit besides, or money refunded. Every poultry owner is urged to try it. Under the guaranty, you don't risk a cent. Thousands use it regularly. It is easily given in the feed, and the slight cost is many, many times repaid in healthier chickens, to say nothing of the big increase in egg production.—Advertisement.

From actual tests made during the past two years at New Jersey the use of artificial illumination has increased the profit per bird over feed and fuel cost for a twelve months period as follows:

Six hundred unlighted pullets paid a profit per bird of \$4.10.

Five hundred lighted pullets, given their illumination in the morning from 4 a. m. to dawn, paid a profit of \$5.77.

One hundred pullets, given artificial illumination by means of the evening lunch method, paid an average profit per bird of \$6.48.

This shows a substantial net return due to the use of artificial illumination. The illumination in this experiment was provided by a Farm Unit Lighting System of 32 volt capacity. It was used on 1,200 birds and the entire cost of current during the period in which the flock was lighted amounted to .044 cents per bird. An increase of one egg paid the fuel costs.—H. R. Lewis.

Profits From a Back Yard Flock

(Continued from page 1034.)

and note the juicy tender blades of the sprouted oats and the stringy, tough looking strands of the dried grass. But even with the 12 per cent difference in favor of the oats, feed the grass in preference to no green food at all for even at that you gain 28 per cent.

No Single Grain Sufficient.

The next experiment was in feeding corn alone, then wheat alone, then dry mash alone.

The experiment of feeding corn alone was of short duration and ended abruptly. I had no desire to forever ruin a fine bunch of pullets in that manner. When in two weeks' time you can reduce the laying of hens over 60 per cent, no further demonstration is necessary and it is time to stop. And that is just what you corn feeders are doing—ruining your chickens and throwing away money. Corn alone cannot make eggs in quantity. Do not try it, and if you are doing it now, stop it.

With wheat alone I had better success. If there is any one grain that can nearly equal a scientifically balanced ration, wheat is that food. When fed alone, the result was only a diminished egg production of 12 per cent. While this is a great unnecessary loss in itself, yet compared to the over 60 per cent loss of the corn alone, it is small. But why have ever this 12 per cent loss? There are many balanced scratch foods on the market that cost but little, if any, more than a straight wheat ration. Why not use them and save this 12 per cent.

Then I tried feeding the dry mash alone, the dry mash containing the extra portion of dry buttermilk and the extra meat scraps as advised in the April article. No whole grains were fed in this experiment at all. If one did not stop to reason, he would naturally see no cause why, if the hens ate all they desired of the dry mash, and with the dry mash to sustain life and make the eggs; third, as is in the balanced scratch feed, the results would not be all right. But the results are not the same, and 28 per cent less eggs were laid with the dry mash alone than when combined with the proper scratch food. First, the combination is not exactly the same; second, hens do not like dry mash as well as the whole grains and will not eat enough mash to sustain life and make the eggs; third, the digestive processes are not the same and the proper exercise is not given the organs of the body.

Then I tried the proper balanced scratch food without the dry mash. That was equally bad on the egg production. Each hen picked out the particular grains she liked; she ate her fill of those particular grains before starting on what was left and never had all the combined grains at the same time and in the right quantities, to properly make the egg in her body. This is what the dry mash does, forces the right proportion of all the grains at the same time. So that grain without dry mash and dry mash without whole grains is about as broad as it is long—you need both the whole grains and the dry mash to secure your full allotment of eggs.

Next I fed in the usual manner, whole grains scratch food and the dry mash but omitted from the dry mash the extra portion of 20 per cent of dried buttermilk. This proved to me that buttermilk in the mash adds a 10 per cent value in egg production for that is just the proportion the egg laying fell off when not using the dried buttermilk in the mash. And when I added the buttermilk again but of less proportion, I found the meat scraps had a value of 14 per cent.

SMASH GO PRICES

Recollect, this mash already had meat scraps in it and the 14 per cent does not mean that if no meat scraps are in the mash your loss will only be the 14 per cent—far from it, it will be vastly greater.

All of these experiments can be very easily verified by any back lotter who has two pens of the same age, breeding and consistent laying qualities as those with which I made the comparison. As a single instance of the value of an animal protein supplement to the ration, which my own experiments verify in substance, let me cite that at Purdue university a pen of fowls that received a balanced ration, grain and mash, produced 135 eggs, while a pen that received the same food except that all meat scraps and milk were withdrawn from the mash, produced about 33 eggs per hen in the course of the year. Just as it takes nails, lumber, plaster, plumbing and brick to build a house, so it takes a variety of material to build the frame of a chicken or to cause that chicken to produce eggs in paying quantities. No one grain is sufficient; and my experience shows that no simplified and abridged system of feeding is anything like as satisfactory as the more compound methods of mixed grains for a scratch feed, supplemented by dry mash which carries animal protein in the form of meat scraps and dried buttermilk. These things add to the cost of feeding but increased returns make their use highly profitable.

Does Back Lotting Pay?

One of the most asked questions in the hundreds of letters I received from the first article was, "Does It Pay to Keep Chickens on a Back Lot?" I answered them all by stating that a city back lot was not the place to expect to make a fortune keeping chickens; but that in proportion to the number of chickens you can keep on such a limited space, it is the best paying investment you can make. It pays not only big, but you have for your own use the clean, sweet-flavored, newly laid eggs in comparison to the rarely fresh, manure-pen flavored eggs of the usual market brand. In addition, you have pleasure and increased health.

Many of the letters asked for definite figures. Here they are for the past year, based on a single pen of fifteen pullets and a cock:

EXPENSES

Scratch Feed	\$42.65
Dry Mash	10.00
Dried Buttermilk	9.45
Meat Scraps	3.00
Oyster Shells, Charcoal, etc.....	2.40
Oats	6.35
O. K. Litter	1.60

Total year's expense.....\$75.45

RECEIPTS

(Value of Eggs at Market Price)

1920	
May, 28 dozen at 43c.....	\$12.18
June, 27 dozen at 50c.....	13.50
July, 24 dozen at 50c.....	12.00
August, 22½ dozen at 58c.....	13.18
September, 22 dozen at 62c.....	13.64
October, 18 dozen at 70c.....	12.60
November, 18½ dozen at 78c.....	14.43
December, 19 dozen at 85c.....	16.15
1921	
January, 25 dozen at 67c.....	16.75
February, 27½ dozen at 47c.....	13.82
March, 30 dozen at 35c.....	10.67
April, 31 dozen at 30c.....	9.30

Total such receipts.....\$158.22
Less expenses above..... 75.45

Hens, 15; clear profit.....\$ 82.77

Profit per hen.....\$ 5.52

In the above calculation, odd eggs over an even quarter dozen were counted in the following month. You will notice that each hen paid a clear profit of \$5.52 over actual cost of feed and litter and that this profit is based only on the market price of ordinary market eggs. No extra profit is shown for eggs sold for hatching purposes, my object being to show just what the profit is to a man who wishes chickens only for eggs for his own use. In fact, my profit per hen was much greater for I sold a very large number of settings at good prices. You will also notice that no deductions have been made under "Expenses" for any interest on investment nor for labor.

The interest on your investment you must figure out for yourself. A well made poultry house will last, with proper care, many, many years. And once started with good chickens, the first cost is practically the whole cost for you can renew your flock whenever you choose

Every Wishbone is a money-maker

Every Wishbone owner last year made more money operating his Wishbone Mammoth Incubator than he could have made with any other machine. Next season Wishbone operators will again lead the field as profit-makers. Be one yourself.

Use Wishbones; hatch sturdier, healthier chicks, and make more money. Use Wishbones and save in fuel, labor and time. Use Wishbones and produce the greatest number of chicks in the smallest amount of space. Double deck or triple deck your present incubators with Wishbone interchangeable units. Substitute Wishbones for other machines, so that you may operate at the lowest cost per chick.

Wishbone Features Swell Profits

The Wishbone Mammoth Incubator saves expense in every item of an operator's outlay.

The Wishbone patented heater saves fuel.

Three-deck construction, found exclusively in the Wishbone, saves space.

Wishbone patented features, found in no other machine, save time and labor.

Send for the New Catalogue

Send today for the new Wishbone catalog. It explains Wishbone features in detail. It will interest you—and it proves indisputably why every Wishbone is a money-maker.

MEAT SCRAPS Triple Egg Yield

In a two-year feeding test by Purdue University it was shown that 30 birds fed meat scraps in the ration averaged 179 eggs per year; while 30 birds fed exactly the same ration but without meat scraps averaged only 59.35 eggs per year. It was further shown that the presence of meat scraps in the ration increased the efficiency of the other feeds and that every 100 lbs. of meat scraps fed produced \$52.57 worth of eggs (average price of eggs, 46¢ a doz.)

MIDWEST SALES CO.

123 W. Madison St. Dept. A Chicago, Ill.

Do you keep hens or do you make the hens keep you ?

The only way to be assured that the hens will keep you is to use only those ingredients in your laying mash which go into the manufacture of the egg. OUR NIAGARA BRAND OF GREEN CURED FINE-CUT CLOVER makes assurance DOUBLY SURE. Its own record is its best recommendation. It has been used in the laying and most successful Egg Farms for the past 35 years. Tender, palatable, nutritious; it furnishes all the Vitamins necessary to keep the fowl in healthy condition while stimulating the function of heavy egg production. With eggs at present prices you cannot afford to be without it. ORDERS PROMPTLY FILLED.

Day-old Chix and Dux

The parent stock of our chix and dux has been Hogan Tested for propentency and high egg capacity for the past fifteen years. Their popularity has increased our output of 80,000 chix to 500,000 head annually within the past four years. Send for our SPECIAL DISCOUNT PRICE LIST covering early Spring deliveries.

from the original stock and those you have already raised from them. Your own labor value I have not counted in, for if you are a real back lotter, it is not labor,—more a work of fascination and recreation.

In considering the egg returns I have shown, it must also be understood you cannot expect such results with hens in large flocks nor with hens of the ordinary barnyard variety. You must have good stock and properly house, feed and care for them. They are easily obtained and not excessive in price. Once properly started in business, with proper housing, feed and care, exactly similar results can and will be obtained as I have shown above. I say this with full knowledge of what can and is being done and in all sincerity. And I say to the farmers as well, you are making a mistake in not feeding properly.

One farmer told me "hens were not made to lay in winter." That, of course, is nonsense. Another said it didn't pay. If I can secure such results as I have shown above with the hens penned up and having only the actual feed I give them, you farmers have a hundred times better chance with your barnyards, your hay mows and the bugs and worms of your range.

The trouble with most of us is, we never keep accurate accounts of receipts and expenses. We all should do it as I do it. When no accounts are kept and the time comes to pay out for the scratch feed, the dry mash, the buttermilk and the meat scraps, oyster shells, grit, charcoal, etc., it seems big, and the receipts, at just that particular time may appear small, and we hesitate to make the expense; but if we had kept accurate accounts we would know that for every dollar we are paying out we are getting a five dollar bill back. Then the expenses wouldn't look so big and we would gladly go ahead and buy the things we actually should buy. Try it once my way and you will always do it. Have just a little common book for the hens alone. Mark down every day the number of eggs received. Let your wife tell you each week the market price of eggs for that week. Each month average the market price and calculate the value of the eggs laid that month. Also mark down every expense for the month. Balance it each month and note the profit per month. It will surprise you. The satisfaction is great.

Beginners and the Poultry Show.

(Continued from page 1036.)

give advice and help get birds to the show in good condition. Pick up a little courage and make a start and experience will be a great teacher.

Show to Learn and Be a Good Loser.

Many new exhibitors expect too much at the start and if they fail to win they become discouraged and are ready to give up in disgust. One thing should be kept in mind and that is to always be a good loser. A poultryman who cannot lose and take his defeat good naturedly had better keep out of the competition.

Some people cannot see anything good in birds that do not belong to them. They seem to have an idea that they have the best to be had, and should their competitors win over them they are ready to find fault. A real poultry fancier goes into a show with the idea that he may win, but if there are other birds better than his own, he wants to lose. He wants the ribbons hung on the best birds, regardless; and should he be defeated he goes to his competitor and congratulates him. That is the right spirit. It breeds fairness of competition, clean sport, and puts honor above mere prize ribbons.

Defeat should not discourage a beginner, because it is only a lesson learned. Many a time I have seen exhibitors at shows who thought they had winners, yet failed to win, and, after the awards were placed, said they would try to improve and make a winning next time. "Look out for me next year," is a statement often heard; and when we hear a new exhibitor talk that way it is an indication that he has the stuff in him and will make a success of the business.

It takes time to build up a flock of exhibition birds and it cannot be done in a few years, but by constant study and learning how to mate, and how to raise the chicks after they are hatched, wonders in production of superior quality can be accomplished.

The great trouble with many of the beginners is that they have an idea that prize winners mated together will produce even better birds. They don't study how to overcome defects. The mating of males and fe-

NOW'S the TIME!

If you like eggs for breakfast these snappy mornings (and who doesn't?) there's **ONE SURE WAY!**

Send for the Sheppard Catalog; throw together a few boards or pick up an empty piano box to serve as shelter from the wintry winds; install a number of nests—and then send me an order for

SHEPPARD'S "Famous" ANCONAS

You'll get eggs—nice big white fresh eggs! You can stage the happy little breakfast scene, pictured above, every morning all Winter long. For the Sheppard Strain of Anconas are "Famous" producers of Zero Weather eggs. They lay—regardless!

It isn't too late—now's just the time! If you send your order today, you ought to have eggs for breakfast a week or ten days later. And Winter's just beginning!

Then, when you like, you can exhibit your birds at your Local or State Shows and "cop" a few prizes. For "Famous" Anconas are noted prize-winning beauties, having a long and consistent record of Big Wins at Madison Square Garden.

Do your ordering today. If you need my Catalog, just drop me a line. You'll have eggs when your neighbors are wondering what a cackle sounds like!

H. Cecil Sheppard

President International Ancona Club
Box 439 Berea, Ohio

males that will produce what is desired, is the secret of success. This may include corrective mating, or even double mating. In some of the parti-colored varieties it is necessary to use males or females that would not have a chance in the show, yet if properly mated they will produce exhibition specimens. This may seem strange but it is a fact nevertheless. Therefore, it is very important that the beginner attend the shows, enter his birds, watch the judging, see where his birds are weak as compared with others and then try to remedy his weakness. This can all be accomplished by careful study and interest in the work and the results will be both interesting as well as profitable. The master breeders of today were once beginners. Their progress has been wonderful and yet it is not astonishing when one thinks of the diligent study that it has been their pleasure to give to their birds.

Amount of Capital Required.

In the September issue of your journal I noticed an article from the pen of H. G. Foster, "How to Start in the Poultry Business," in which he outlined the cost of starting a commercial poultry farm, on only a medium scale, and which he said would cost at least \$10,000, and then the owner needed \$3,000 more in the bank to draw on.

I was indeed surprised to see you print such an article in the Journal, which would throw so much cold water upon the aspirations of thousands all over the country whose dream of engaging in the poultry business at some time. Now, as I have had fifteen years of practical experience in this line of work, as superintendent and manager of some of the best commercial poultry farms in the East and Middle West, permit me to say that in my estimation, Mr. Foster did not know what he was talking about, and I can prove that he is all wrong.

I have built three new plants for different parties and I know.

First if one's capital is small and he wants just a medium size plant, all he needs is two or three acres, not over three, and this only for range for the young stock he is going to raise.

He can build his brooder house 100 ft. long by 14 ft. wide. The material in it will not cost over \$300. Divide it up into eight rooms 12x14 ft., put a coal burning brooder stove in every other room. Hence every other room is a feeding and exercising room. These four stoves will care for 2,000 chicks. As soon as the chicks can do without the stoves take them out. A little later take out all the partitions and throw it all into one long room and let the chicks run at will. It is, of course, necessary to have the chicks all the same age when this plan is followed.

Raise them up in this house and as they come to maturity put in your dropping boards, roosts, and nests; then when the pullets commence to lay they will continue to do so.

Never change a chick's home if you can help it, and by this method you do not have to. This same house is now a laying house and will care for 800 layers, if built and arranged as I build them.

In my experience I discovered the properly built house is very nearly the solution of the poultry man's problems. For successful poultry raising I have no use for colony houses at all. They are too expensive, and like a brooder house built for that purpose alone, is dead capital for about nine months of the year. By my system I use the house twelve months of the year. One only needs two of this kind of houses to raise

It's NOT too LATE

If you've let the year slip by without sending for your copy of Sheppard's Ancona Catalog—**DO IT TODAY!** Why not spend a pleasant hour or two, one of snappy winter evenings, with the story of "Famous" Anconas? I can guarantee that you'll enjoy it!

And while you're reading, consider the case for

SHEPPARD'S "Famous" ANCONAS

Perhaps the fowls you have are of some other breed. Good! Put "Famous" Stock beside them, give the same care and treatment—and **LESS FEED**—and I'll venture to predict that by Spring most of your other birds will have gone the way of the Sunday Dinner!

For Anconas never seem to realize that according to all the rules, chickens are supposed to stop laying during cold weather. The mere fact that the liquid in the thermometer tube is trying to push its way through the bottom doesn't seem to mean anything to them—they keep right on laying large white, full-meated eggs.

And the Sheppard Strain of Anconas are beautiful show-birds too. They have cleaned up on desirable prizes at Madison Square Garden for many years.

It's never too late to order winter-laying birds. Just install a few extra nests and send me your order. If you need it, I'll be glad to send you my catalog and Special Prices.

H. Cecil Sheppard

President International Ancona Club
Box 439 Berea, Ohio

Pedigreed winter layers

that will lay eggs for you the coldest day in winter.

That our birds do this is evidenced by reports we get from our customers. It is not so remarkable for our birds to do this when you but stop and think that for over 30 years we have been trapnesting, pedigreeing and Hoganizing every bird on our farm to attain this purpose.

800 or 900 pullets a year and keep an additional 800 layers. And you only need two or three acres of land. When the pullets commence to lay confine them to the laying house and keep them in all the time; never let them out until sold. Always aim to keep two-thirds pullets and one-third hens through the winter.

I raise nothing but S. C. White Leghorns, and they commence to lay at four and one-half to five months old. But, friends, it requires experience to raise chickens by the thousands.

It does not require a large outlay of capital to start, as Mr. Foster imagined, and if he or any one else doubts my statement I'll build such a plant for them and show them I know what I am talking about and give them some ideas in this line of work they never read or dreamed about.

I do not claim I know it all, but I do know a man can engage in the poultry business on a small capital if he knows how to manage it and get a good living and a nice profit out of it.

On a poultry farm where I was last superintendent I had one pen of 425 S. C. White Leghorn pullets that laid enough eggs in twelve months to give a profit over their feed of \$1,077.95, and this was when feed was at its top price. But do not let any back lotter lead you to believe you can make a profit of \$4 to \$6 per hen in the commercial egg farm business where the birds are kept in 500 to 1,000 lots. It cannot be done, and no honest big egg farmer will tell you he does it.

I took charge of a plant a few years ago that had 900 old hens on it, 75 young ones. I culled out 600 old hens. From the remaining 300 I built up a flock of birds in two years that was easily worth \$5,000, and I can do it again for any man. But do not let these \$10,000 dollar plants discourage you. Go to it. It can be made to pay with much smaller capital.
G. E. Stillwagon.

Illinois.

Poultry Raising in West Virginia

Although farming as a general proposition has not been offering an even break during the past few years, evidence from such states as West Virginia shows profits from poultry raising in nearly every case. Prices of feed have gone down, leaving the margin of profit at least equal to that shown when poultry and other farm products were much higher. These poultry flocks are often found to be the only reliable source of ready cash on the small general farms. Egg money has paid the taxes, bought the children's shoes, and enabled the housewife to leave untouched the little nest egg in her savings account.

In West Virginia the state agricultural extension division of the state university has not attempted to extend help, except incidentally, to the large commercial poultrymen, for he seldom needs such help as the farm woman or man with the small flock of hens.

In many parts of West Virginia the farms are small and perhaps unsuited to specialized agriculture on a basis sufficiently large to be profitable. It is on such farms of one hundred acres or less that the small poultry flock fits into the ideal combination of poultry, a few dairy cows, a small orchard and some truck gardening. This combination is the kind that virtually insures a reasonable return each year, because it is one that is almost impossible of complete failure.—Rose B. Johnston.

Feeding for Color.

If you want golden yellow skinned poultry and deep yellow yolks, feed some yellow corn and let the birds run on a good range; or, in winter, feed some yellow corn, some ground alfalfa and some ground carrots. Sprouted oats produced in the dark, without the rays of the sun, will not heighten the color of the yolks.

GREEN SHEEN STRAIN

Silver Campines

Elegant young stock, well grown, now ready for sale at fair prices. A wonderful selection of cockerels, pullets, cocks and hens at your command. I am especially prepared to furnish exhibition birds that will win for you and prove to be sound breeders. My birds are single mated and exhibition birds are mated together. No trick back of these birds.

Campines are fast growers, plump at all ages, heavy layers of large, white shelled eggs and eat less food than Leghorns.

I have the largest plant devoted to the raising of exhibition and high egg-record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 62 males placed under ribbons at the Coliseum Show in last nine years. During the same period, I have had 147 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

Write me for information. Your absolute satisfaction is guaranteed.

The CANDEE advantages of sectional construction and operation and its exclusive, patented double automatic heat control and perfected ventilation system—make CANDEE approach natural hatching conditions as closely as is possible mechanically, besides eliminating time, labor, worry and affording economy in hatching cost. CANDEE hatched chicks are vigorous from the start and develop into sturdy, healthy, profitable birds.

Photo of 1200 egg CANDEE with one compartment open, showing nursery under egg trays and one of the removable bottoms and egg tray.

CANDEE Incubators

Each compartment—two to each section—has its own automatic temperature regulator that controls the flow of hot water from the main supply pipe, keeping the temperature constant. The automatic regulator at the heater controls the drafts and keeps the water in main supply pipes at proper temperature under all conditions. The perfected ventilating system assures proper oxygen supply, but does not rob the eggs of their original moisture.

The big, free CANDEE catalog describes in detail the superior features found in CANDEE Incubators with many pictures of poultry farms all over the country. Send for your copy today.

Increasing the Winter Egg Yield.

(Continued from page 1037.)

be furnished every hen. The same with shell, for it is needed in shell formation. Keep both in open hoppers.

If the hens you are feeding for winter eggs are of the lighter breeds, as the Leghorns, the above amounts will be about right. If you are keeping the heavier breeds, add one pound of scratch grain per day per hundred hens. But, in either case, keep close watch over the fowls, and do not allow them to become overfat. Force lots of exercise, and regulate the exact amounts of scratch grain according to the needs of fowls.

Hens (100) Meals—where the fowls are under artificial lights. If lights are used in early morning: Scratch grain, same formula as above, but add three pounds, or thereabouts per day per hundred hens. Feed it, by scattering in the litter late at night, so that the fowls can get it first thing in the morning. Always have water ready for them then.

The mash remains the same. Encourage its use by providing more hopper feeding space. Open mash troughs are good. Always green food, fed during the forenoon. And teeth and shells.

If lights are used on the evening lunch plan (described later in the article): Scratch grain, same formula, feeding three pounds after breakfast, three pounds at 11 o'clock six pounds between 2:30 and 3 in the afternoon, and the other three pounds at 9 in the evening when the lights are turned on. Water, as always. Dry mash, green food, shell, and grit.

A Hen's Working Day.

We, who raise chickens, used to think that sunrise and sunset just about marked the hens' working day. But this winter many of us are slipping something over on the hens and are requiring of them extra time enough in which to consume another meal. There has not one thing been brought forward for the poultryman in the way of more efficient methods

or practices these last few years than the use of artificial lights in poultry laying houses during the season of naturally long nights and short days. The question of immediate concern is how can the lightning be used economically.

Using artificial lights for hens is simply a feeding problem. It wakes them up and induces them to eat more food. More food means more eggs. The whole thing is very simple. But have a care! Use lights carefully and advisedly. The writer has had all of his experience with using artificial lights either as morning lights or "evening lunch." Each seems to be equally satisfactory.

A choice between the two would seem to be mostly a matter of convenience to the caretaker. Morning lights cost somewhat more, too. Use either, not both, system from November on through the winter months on the flocks that are being forced for a high table egg production. The pullets are usually the victims of this conspiracy.

Morning lights means the turning on of lights in the poultry houses from 4 or 4:30 to daylight, to give an approximately fourteen hour day before sunset. Automatic switches or alarm clocks rigged up properly will save the poultryman from early rising.

A Feeding Problem.

If the "evening lunch" system is used, turn on the lights between 9 and 10 at night, or for an hour during the evening. It should have been long enough after the afternoon feeding to guarantee the birds being hungry. This method uses less light, and many are finding it as satisfactory as morning lights. Time alone will prove this point.

If electric, or other lights are used,

Opened wing of Barred Plymouth Rock female owned by W. D. Holterman, Box A, Fort Wayne, Ind.

there are a few things to be remembered:

Water when the birds first come down from the perches after the lights are turned on is all important.

Arrange the feeding so that the birds exercise vigorously while down off the perches, for they must not get chilled.

Increase the dry mash consumption. Allow one linear foot of space along side the mash hopper for every four or five hens in the pen. Put the dry mash in open troughs or hoppers so that the hens will be tempted to eat it.

Use the lights regularly after once starting.

In the spring, as April approaches, gradually break the birds off from lights, but do not do so suddenly. Take fifteen days in which to make the change.

In case electric lights are available, they form the best source of illumination. Use one 40 watt globe every ten feet, that is two globes in a 24-foot house width.

Place the light up near the ceiling and arrange so as to cast as few shadows as possible.

Use some sort of water heater during coldest weather, so that the drinking water will not freeze. They need lots of it.

Why use artificial lights? It is plain good business for the small flock or big. It will nearly double winter egg production. It will quadruple profits, as a rule. It will probably increase the average egg production per hen per year by about ten eggs. It will shove the heavy egg laying season ahead to winter months, the season of high prices and general low production.

Feather Eating.

Lack of exercise may be largely responsible for feather plucking, so it will be well to provide hens in confinement with sufficient exercise to promote their health and keep them out of mischief. Make them scratch for their grain food and jump for their green food. The latter suspended from a string a foot or two from the ground will do the trick. Feather plucking hens should not be fed too heavy for a time. Give Epsom salts—teaspoonful to each 12 hens—and rub the affected parts with a mixture of sulphur and vaseline or bathe bare places with quassia bark solution.

POULTRY FEEDS

Story of "The FUL-O-PEP Way"
As told by
America's Greatest Buff Orpington Farm

MAYSLAKE FARM POULTRY DEPARTMENT

"Single-Comb
Buff Orpingtons

"Oldest winning
strain in
America"

Hinsdale, Ill.

10th October, 1921

The Quaker Oat Co.,
Chicago, Ill.

Gentlemen:-

During the past 2 years we have been using "Ful-O-Pep" laying and growing mash with most gratifying results. Through the feeding of your Laying Mas we have almost trebled our supply of eggs with fewer birds to that formerly obtained during the wintermonths. This, combined with judicious selection and by records kept, has enabled us to establish a high record laying strain in Buff Orpingtons, Rhode Island Reds and White Leghorns.

We consider also, that "Ful-O-Pep" Growing Mash is a far superior chick developer to that of any other brand we have tried out. Through its uses we have been able to out-class and outweigh birds in the shows by several pounds even when our birds have been younger.

In competition at four of the largest shows in the past two years:- Ohio State Fair 1920 and 1921; New York State Fair; and Chicago Coliseum Show, our Buff Orpingtons were awarded in the 20 classes competed in, 15 Firsts; 15 Seconds; 7 Third Prizes, besides 8 Championships including 3 times that for Best Bird in entire show of several thousand birds.

The phenomenal record is attributed to a very large extent to the wonderful developing and conditioning ingredients which "Ful-O-Pep" contains.

Yours very truly,
Mayslake Farms;

Frank J. Conway Manager, Poultry Department.

**S. C. White Leghorns
A Specialty**

Suffield, Conn.
September 21, 1921.

Gentlemen:-

You will probably be interested to know that I began feeding Ful-O-Pep Feeds to our first pen of pullets which were hatched on the 12th of March, and are now (Sept. 16th) laying better than 52%. They are fine birds; the first ones this year laying just three months and eighteen days from the date of first hatch.

We hatched a little over 22,000 chicks this year and recommended Ful-O-Pep Feeds to any customers who asked about feeds, feeling sure they could raise their chicks much easier the Ful-O-Pep way than by any other method. We put 9400 chicks on range and now have 4280 of the finest pullets one could wish for. I am enclosing a few snapshots showing the range, etc.

Yours very truly,

HILLTOP FARM,

H.W. Lambert,
Poultryman.

H.W.L.S.

SPECIALTY BREEDERS OF WYCKOFF'S S. C. WHITE LEGHORNS
ACKNOWLEDGED EVERYWHERE THE WORLD'S GREATEST LAYING STRAIN
UNSURPASSED IN STANDARD QUALITIES

AURORA, NEW YORK October 5 1921

Attention Mr. Angell

Quaker Oats Company
Chicago, Ill.

Gentlemen:-

Extending over a long period we have given your
Ful-O-Pep Dry Mash a thorough trial on our layers and breed-
ers here at Grandview Farm, making a most thorough test in
comparison with other commercial feeds before fully deciding
on the Ful-O-Pep brand, and our findings prove it superior
to any other feed we have ever tried, being uniformly alike
at all times, made up with the highest grade ingredients and
thoroughly blended, insuring perfect health and condition
of the stock, and maximum results.

Ful-O-Pep is the only dry mash we ever fed that
hens would not sort and pick over after being fed on it some
time, showing conclusively that all their needs were being
fully supplied.

We do not believe it possible to secure the necessa-
ry ingredients for home mixing and make as perfect a blend
in a laying mash of equal quality as economically as Ful-O-Pep
Dry Mash can be purchased for already prepared for the hoppers.

We wish you continued success with this worthy
product.

Yours Very Truly

This interesting and valuable book fully explains the Ful-O-Pep Way of raising poultry—the Way that is proving so successful everywhere. This book contains pages for keeping monthly egg records, also account sheet pages for keeping a record of receipts and expenditures from poultry. You will find this book extremely helpful. Written by Albert Angell, Jr., The Quaker Oats Company's Poultry Expert.

The Quaker Oats Company

Poultry Dept. Address, Chicago, U. S. A.

Distinctive Points of Hamburgs.

(Continued from page 1035.)

result is a lopped comb which utterly ruins a bird as far as exhibiting is concerned.

Do not mix any condiments in the mash especially for Goldens and Blacks. If you do, look out for off colored feathers. In Blacks you will find red feathers on the neck and saddle, in Goldens white tipped feathers. Although opinions vary as to the cause of these off-colored feathers, some saying they are due to too rich food, others believing they are natural in highly colored matings. I aver it is nothing more nor less than conditions and improper feeding in raising the young stock.

Incubator or hen hatched chicks require the same attention. Hamburg chicks grow very fast and have a tendency to form wing feathers at the expense of body. Avoid this

at the beginning by feeding a good commercial chick mash. In addition supply fine grit, shell and charcoal. Keep them busy scratching for the fine grain. During the first week litter for the floor should be finely chopped, hay in preference to anything else. The second week replace this with two inches of good black dirt on the floor to give the necessary moisture that prevents leg weakness. Change this every four or five days.

When the chicks attain the age of three weeks, feeding correctly for size and feathers must begin. I consider the following formula just right for the purpose: 4 ounces hulled oats—steel cut, ½ ounce flax seed, ½ ounce cracked corn fine, 7 ounces cracked wheat.

In addition to grit, shell, charcoal and fresh water, supply fine ground-bone meal and meat meal, just as much as they will consume in ten minutes. This should be fed three times a week, greens every day in the form of finely

chopped sprouted oats, lettuce, kale or grass. Cabbage, in my opinion, scours too much and should be fed only when other green stuff is not procurable.

When seven weeks have elapsed, use the same grains in coarser form and gradually increase the size of the grain with age. Any good growing mash should be used in conjunction with the grains and kept before them all the time.

Feeding alone will not raise the Hamburg chicks if other conditions are not right. See that they have comfortable quarters. A house that is drafty or leaks with every shower is not conducive to their well being. Cleanliness is next to Godliness. See to it. Provide abundance of room for exercise, a large run, preferably covered in, yet allowing plenty of fresh air, is desirable. Youngsters with free range naturally have the advantage but this is not possible in city back yards.

What Constitutes a Good Hamburg.

The ideal Hamburg male, one that measures up to Standard, should possess a small neat rose comb, square in front, firm and evenly set on the head. The comb must be free from a hollow center, the top being covered with small points, and the comb should terminate at rear in a spike that has a slight upward incline. The head should be short, medium in size, with a well curved beak. Eyes large and round, wattles well rounded, thin and free from wrinkles. Ear lobes of medium size, white, round, smooth and fit closely to the head. The neck should taper with a full hackle flowing well over the shoulders. Back of medium length, gradually sloping on nearly a straight line to base of tail. Breast round, prominent and carried well forward. Body round and symmetrical, wings large and carried rather low but held firmly in place. Tail full and well expanded, carried at an angle of forty degrees, sickles well curved. Shanks medium length, toes straight.

Female—Head short and medium in size, comb similar to male but smaller. Wattles small, thin and well rounded, fitting closely to the head. Neck full at base slightly arched and tapering to head. Medium length back moderately full with slight concave sweep to tail. Tail full and expanded, carried at an angle of forty degrees. Body round, prominent and carried well forward. Thighs medium size, shanks rather short and slender, toes straight.

Black Hamburgs.

My first pen of Hamburgs were black, given to me by my father, who was, and is at the present time an ardent admirer and breeder of Hamburgs. I always had a particular fancy for the Blacks and was so enthusiastic over a cockerel and pullet, having petted and cared for them, that he gave them to me as a gift. I was overjoyed at actually possessing these birds, and immediately built a house apart from his and set to work in my own way. His experience and knowledge put me on the right road and the following year, 1897, I exhibited a pullet at the Highland show at Aberdeen. In a class of twenty-three birds, I captured first prize and gold medal for the best female in the show. My boyish exuberance overflowed at this wonderful result and from that time the Blacks became my firm favorites.

There is nothing so wonderful as the beautiful sheen or lustre on a Black Hamburg male or female. The sheen is so intensified that the color appears to be a beetle green. The Standard calls for a surface that is lustrous, greenish black throughout, with undercolor of all sections dull black. Comb, face and wattles bright red, ear lobes white, shanks and toes black, beak black, eyes reddish bay. Sometimes a purple barring appears in sections such as the tail and tail coverts. This is due largely to incorrect feeding, and keeping the young stock too closely confined. In the males, we often find occasional feathers that are all red or straw colored, usually in the hackle and sometimes in the saddle feathers. This is a case of mating together too highly colored birds. To get the best results, mate a highly colored male to females that are duller in color, that is slightly lacking in sheen; the result will be good birds of both sexes. To secure birds of excellence in either sex, double mate.

Cockerel mating—Select a richly colored male, good in every section and mate to females that are dull in color. Too large an ear lobe on the male is liable to cause white in the face and if this annoying feature is present in your flock, prefer gypsy or purple faced females to counteract the defect in the cockerel mating.

Pullet mating—Mate a highly colored male to females of like color. Pullets will be exceptionally rich in color but the red or straw colored feathers are liable to appear in hackles of the males.

Spangled and Penciled Varieties.

The Golden Spangled Hamburg has a beautiful plumage of golden bay ground color. Feathers on neck are golden bay with a greenish black stripe extending down middle of each feather terminating in a point near its lower extremity. Breast is a golden bay, each feather ending with a V-shaped greenish black spangle. Back is same color, with spangles. The texture of the feathers giving the spangles a rayed appearance in the male only. The wings are a rich golden bay, coverts the same, each feather ending with a spangle, which forms two distinct parallel bars across the wings. Tail, lustrous greenish black. Tail coverts in male black, in female golden bay. The legs of both are a leaden blue.

In breeding Golden Spangled, I endeavor to select a male that possesses a rich ground

color, darker than the Standard calls for, approaching mahogany, and mate him to females that are up to Standard, good in color and well spangled. From this mating, good birds of both sexes can be produced.

The Silver Spangled are practically a repetition of the Golden as far as markings are concerned, substituting white for golden bay. The tail feathers are white, each feather ending with a greenish black spangle, while in the Golden the tails are black instead of golden with black spangles as might be expected. The hackle feathers of the Silver terminates with an elongated spangle instead of being striped as in the Golden. Inspect the back feathers of your birds. This section is most important in both male and female.

In mating Silvers select females that approach Standard requirements as far as possible. The undercolor should be slate, feathers black and white in equal proportions. However, if the flock shows signs of lightening up, that is showing too much white, choose females that show a dark or black undercolor and mate with a Standard male. Avoid birds that show brown on the throat or mossiness in any section.

The Penciled Hamburgs, both Golden and Silver, are probably the most handsome of the Hamburg family. The Silver male is a beautiful bird, with his pure white neck and breast and his tail of black edged with white. His body is white, the sides below wings penciled across with black bars; fluff slaty white. The head and neck plumage of the female is white except at the base where penciling begins, each feather being penciled across with narrow bars of lustrous greenish black. The wings, back, tail, breast and thigh are all distinctly penciled forming parallel bars extending across the feathers. Shanks leaden blue. The Golden is a repetition of the above except that the white is replaced with the reddish bay color. The tail of the male is black, sickle and covert feathers have a narrow edging of reddish bay, fluff black. In the female the tail is bay, penciled across with greenish black.

Mating Penciled Hamburgs.

In breeding both the Golden and Silver Penciled it is advisable to use the double mating system.

Cockerel mating—Choose females that are inclined to be coarse in penciling or have no penciling in breast, but be sure that the upper webs of the flight feathers or primaries are black in the Golden and white in the Silvers. In each case this will give the strength of color to the tail in the male.

Pullet mating—The females for this mating should be Standard as regards markings. Select males that show penciling in breast, sides and in other sections. A hen-feathered male is the best to mate for pullets, as he is usually barred in all sections and has short or no sickles. Sometimes they do not fertilize, but produce excellent pullets when they do.

The White Hamburg—This member of the family has pure white plumage in all sections. Shanks and toes leaden blue. Mate birds that conform to Standard requirements in all sections.

Care of Pullets

At this time of the year it is very necessary to take special care of the pullets that are to be kept for winter layers. It is upon the condition of the birds at the beginning of their laying period that profit or loss depends. Birds that have contracted colds and roup never make as good a yearly record as those that have been free from disease.

Pullets should be placed in winter quarters at once, for if they are allowed to roost around on fences and in buildings where there is a draft, they are very likely to contract colds, and these colds usually develop into roup. The fall rains, with the damp, chilly weather, are very harmful to the birds if they do not have access to a dry, well ventilated house.

If the house intended for the flock has been used the previous year, give it a thorough cleaning. Clean out all nests and all scratch material that is left on the floor. The dropping boards should be cleaned. The nests, dropping boards and roost poles should be scrubbed and placed in the sun to dry and air out well. After the house and all its fixtures have been well cleaned, it should be disinfected with some good coal tar disinfectant.

This disinfectant can be applied by using a hand sprayer or a bucket spray. In spraying the house, be very careful to get the spraying material or disinfectant into all cracks or hiding places of the mites. Place clean nesting material in the nests and new scratch material on the scratching floor, and your house is then ready to receive the flock.

Do not wait until the pullets are nearly

A MONEY MAKER FOR POULTRYMEN

The "EVERGREEN" Oat Sprouter

—the sprouter that's different

Cuts Your Feed Costs

At Last!

The Perfect Oat Sprouter

After many years experimenting to produce an oat sprouter that would produce the greatest amount of tender green oat sprouts in the shortest time with less trouble and without any waste or spoilage, we have at last succeeded. This new improved EVERGREEN OAT SPROUTER is in a class by itself. Whether you are a "back-lotter" with only a few birds or if you are raising poultry on a large scale you need an EVERGREEN OAT SPROUTER—it spells SUCCESS to every poultry raiser—it cuts down feed costs—it

Converts One Bu. Oats into more than Three Bu. Green Feed

The secret of the success of the EVERGREEN is in its two heat chambers—its interior arrangement—its heating system and its convenience. We discovered that different degrees of heat were necessary during varying stages of germination and growth of oat sprouts to get best results—the EVERGREEN supplies the different temperatures during the various stages—that's why it produces more green feed with less grain and without spoilage.

Our "Seven Tray" machine supplies you with a never ending supply of an abundance of tender green sprouts, enough for your flock of hens every day. Each day put in a tray of raw oats, at top of machine and take out tray of tender sprouts at bottom—it's a revelation—nothing like it ever before offered.

Write for FREE Folder "Solving the Question of Winter Egg Production." Write today for descriptive catalog folder and price list, telling all about this wonderful machine—how it will enable you to double and treble your poultry profits. Don't buy an oat sprouter of any description until you find out about the better, more convenient "EVERGREEN."

Rare Bargains .: Closing Out Sale

This advertisement can interest only the person or breeder who knows what Purebred Poultry of the very first class should be. We offer the following for immediate shipment, every bird of them bred from 200 to 265 egg strains and many with records of their own:

450 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn females, 1 to 2 years old.

65 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn cocks.

200 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn pullets, 4 to 6 months old—many now laying.

85 S. C. Rhode Island Reds; Buff Orpingtons and S. C. White Leghorn cockerels, 4 to 6 months old.

We desire to close out this surplus stock, which does not contain culls, this month, and will make special prices for quantity purchases. Also for sale cheap—10 Section Candee Giant Incubator, complete, 6000 egg capacity, used two seasons. If interested in any of the above, address

Roup Killed Them

100,000 Chicks Died Last Night

That's probably true, for that means only one death to every 64 farms in America—a ridiculously small average during Roup time. Millions of chickens killed yearly by this terrible disease. Stop it with

Conkey's the original Roup Remedy
Kills the Germ—Saves the Chicken

Put it in the drinking water—chickens doctor themselves. Keep it on hand and use it for prevention. Sold by dealers everywhere.

CONKEY'S POULTRY TONIC Keeps Hens Healthy and Gets

Winter Eggs
It is a Regulator, Laying Tonic, Moulting Powder and Chick Conditioner of the highest type. No cayenne pepper—no filler. CONKEY'S POULTRY BOOK is well worth 50c to anyone who keeps chickens. Sent for 5c in stamps.

THE G. E. CONKEY CO., 6531 Broadway, CLEVELAND, OHIO

Try the New Way To Kill Lice

A hen worried to death with lice can not lay if she wants to. You might as well "throw money to the birds" as feed high price food to lousy chickens. It's a dead loss—don't do it. Use "LICECIL." No dusting, no dipping, no painting. Hang up the bottle. It acts like magic. Testimonials from every state in the union tell of wonderful results from its use.

Simply put a few drops in nests and on roosts and hang uncorked bottle in coop or hen house. Powerful evaporating vapors which leave bottle are three times heavier than air descend in a misty form,

penetrating feathers, cracks and crevices everywhere. Lice, mites, chiggers, bed bugs, ants, roaches, etc., have no lungs—they breathe through the pores of the body, and are destroyed by Licecil vapors. Will not injure chicks. Bottle, \$1.00; 3 bottles for \$2.50; 12 bottles, \$9.00. Prepaid. Money back if it fails. American Supply Company, Dept. 54, Quincy, Illinois.

ready to start laying to place them in the laying house. If they are allowed to remain out on range until they start laying and then moved to the laying house, they usually stop laying for a time. On the other hand, if moved some time before starting to lay they become accustomed to their new surroundings before the laying season starts.

After they have been put in winter quarters, a good laying ration should be fed. The following is the ration used at this station and is giving good results: Cracked corn and whole wheat, equal parts. When cold weather sets in change the ration by using twice the amount of corn, making two parts of cracked corn to one part of wheat. This scratch feed is to be fed twice a day in a deep litter.

The dry mash that should be before the birds at all times may consist of the following: Equal parts of corn meal, wheat bran, wheat shorts, ground oats, and meat scraps, and from two to five ounces of salt to the hundred pounds of mash. Care should be taken to have no lumps of salt in the mash.

If there is a large supply of sour milk available, the amount of meat scraps can be materially reduced, thereby lowering the cost of the ration. If the pullets are where they can run on a grass lot, or on a rye patch, green feed need not be supplied; but otherwise sprouted oats should be fed. Always supply clean, fresh water, grit, oyster shells and charcoal.—H. B. Lansden.

Pullets Should Be Culled

During the recent years of high prices for poultry products little attention was paid to culling pullets because even the relatively poor layers were likely to prove profitable during their pullet year. Under present conditions, however, when there appears to be some danger of an over-production of poultry products, the most certain means of insuring profit from the flock is to adopt the most efficient methods of management. And one step toward greater efficiency in the producing flock which should be taken by every poultry keeper is to thoroughly cull the pullets to remove all those that show by their physical characteristics that they are not capable of sustained high egg production.

Culling pullets is somewhat different from culling hens and requires somewhat closer attention to the indications of health and vigor than is necessary in culling hens. Hen culling is based largely upon the past performance of the bird as indicated by the amount of yellow pigment in her shanks and the time of molt, together with her physical condition at the time of culling, while in pullet culling the future production is the point that must be kept in mind, and this can be judged most accurately by the physical development, vigor and body type of the bird. In culling pullets but little if any attention should be paid to the distance apart of the pin bones, nor should the pullets that have yellow shanks be discriminated against on that account.

A study of the head of each bird is a very important part of the culling operation with pullets. The ideal pullet head should be short and broad with a short, well curved beak, a bright prominent eye and plenty of depth of skull above the eye. At the same time the head should be trim and neat and show no signs of beefiness or masculinity. Since early maturity in pullets is one important indication of their laying tendency, the birds that show early reddening of the comb should be favored in culling, while those that have dull heads after a majority of the birds of the same age have started laying had usually best be discarded. In body type the pullets which will make heavy layers will have well sprung ribs and a back that is straight and broad and will carry their width well out to the rump instead of being wedge shaped back of the hip. The back of a promising pullet will have the same characteristics desired in a fine beef steer, that is the back should be broad and flat on top with the sides deep, giving the bird a somewhat rectangular shape.

Any pullets that show long narrow heads, commonly known as "crow-headedness," that are late maturing, have poor chest development and a pinch back or that lack depth of body measured by the distance from the end of the keel bone to the top of the back bone, should be discarded in the fall.

A very satisfactory way to cull pullets is to go into the house with a catching hook when the birds are all on the floor and take out those that look most undesirable. The general type of the pullet can usually be easily seen as she moves around but it is also advisable to handle each pullet carefully, noting particularly the development of the head and the spread of rib and width of back.—T. S. Townsley.

AGENTS SEND FOR FREE OUTFIT OFFER

Roup Virus

Hoping that others may be benefitted I am led to relate a recent experience with roup.

In September, 1920, my flock composed of 50 pure blood White Wyandotte yearling hens and about 150 pullets and cockerels was apparently in fine shape.

There had been no disease in the flock during the spring or summer and practically no loss after chicks were two weeks old.

The young stock was developing nicely—combs red, eyes bright and no hint of trouble in sight.

Then one morning I noticed two of the largest pullets remained on the roost at feeding time, and upon examination found small raw patches or pustules around eyes and on combs.

I at once isolated the affected birds in a distant colony house and began treatment, using a solution of liquid antiseptics as a wash for affected parts, followed by carbolated vaseline.

At the end of a week seven patients were in the hospital. The first cases were improving and new cases displayed yellow patches in roof of mouth and on tongue. We then sprayed head, mouth and eyes with a much advertised "roup cure," using a medicine dropper, inserting it in the opening in the roof of the mouth and forcing the fluid through the eye.

At the end of three weeks first patients were in good shape, pustules healed and no further complications.

During this time all buildings were sprayed several times with Kresol Dip, first being sure that the day was warm and sunny so that they were certain to be dry by roosting time. Enough permanganate of potash was used in drinking water to color it.

Although every effort possible was made to check the disease new cases came in. The bird, to all outward appearances, would be in good health but upon examination a ring of yellow or raw sore was found to surround the opening into the windpipe.

Treatment used with former cases brought no improvement and finally I resorted to touching sores with nitrate of silver, but this seemed but to delay the formation of a hard scab around the windpipe opening which, in a few hours, completely closed and bird was smothered to death.

At this time 20 birds had been affected, all recovering except five, all of which died in the manner above stated.

I knew then that I was not able to control the disease by the methods I was using and wrote to our State Department of Poultry Husbandry, receiving a very prompt reply, advising me to avoid all draughts in houses, keep windows open and disinfect (all of which I had been doing) and to use roup virus, as it had been successfully used with the state flock for the last four years.

I at once wrote for further directions, as I had never heard of roup virus, but knew that advice coming from this source was worth heeding.

The virus came in tightly sealed bottles accompanied by explicit directions as to using, which I followed.

This is not the difficult task one might imagine. Evening seemed the best time for the work and a small table was placed directly under the electric light in the colony house.

One person laid the bird on the table, held tightly by the legs with one hand while the wing was held back by the other so that a second person might make the injection on the body under the wing. About two minutes were required for each bird.

We then placed the birds on the roost and found them busy scratching the next morning with no ill effects from the operation.

There has not been the slightest case of roup in the flock since the virus was used. The cost of virus, five cents per bird and trouble of using is very small in comparison with the cost of various so-called roup "cures" and of birds lost, not considering the time and trouble taken in treating sick birds.

It seems to me all poultry raisers would very much rather vaccinate yearly, as is done with our state flocks, thereby being sure flocks would not suffer from the most contagious disease among poultry.

Light attacks may be handled, perhaps, by thorough and persistent disinfection and use of remedies before mentioned, but a bird once a victim is very susceptible to a second attack, while new cases will most certainly continue to show up.

We cannot do better than give virus a trial.
Ohio. Mrs. T. W. Needham.

Why Is This Hen A Money Maker?

Like all profit-making fowls she had a GOOD START; she was raised right, and she PAID. This hen was bred right; she was hatched right, brooded right; housed right, and fed right.

There is profit in poultry when fowls are raised RIGHT, and more folks are realizing this every day. Our new book

"How To Raise Poultry for Profit"

leads to the way. Send for this book; it is FREE. It tells you many valuable facts on feeding, housing, selecting layers, etc., and poultry raising as a business.

This remarkable book was planned by the foremost poultry experts of the country (men who have been recognized by the U. S. Government and by Leading Agricultural Colleges and Universities as authorities on Poultry) and it tells you of the most practical special service ever organized for the development and improvement of the poultry industry.

YOU CAN get more Winter eggs, at Winter prices; YOU CAN make money from poultry. We KNOW you can. The new free book tells you WHY we know. Don't delay! This is the most "worth while" book on Poultry Raising for Profit ever offered FREE; you have never had such an opportunity as this, and if you are AT ALL interested in poultry you should

24 Hens Average 183 Eggs in 12 Months

Bought Old Hens Sent to Market Gave Over 4300 Eggs in Year

"I am not an experienced poultry-man, but will tell you my experience in using Giles Poultry-Tone. I bought a crate of 24 Leghorn hens from a South Water Street commission man. I commenced giving them Poultry Tone, according to directions, twice a day for 10 days. In the meantime they had commenced to lay. I continued to give them this mixture three or four times a week. For twelve consecutive months, I year, I kept an accurate account of the eggs received from these hens. They gave me 4,392 eggs. Experienced poultry men told me this was an exceptional yield of eggs, especially as the hens were old."

(Signed) J. J. Bonner, Chicago, Ill.

"Giles" POULTRY TONE

Send your order today for this wonderful efficient tonic-conditioner if you want a lot of high priced winter eggs. POULTRY TONE puts your fowls in highest state of health and vigor, and keeps them there.

POULTRY TONE will greatly increase egg production because it increases the appetite, aids digestion, makes the bowels more active. It tones up the egg-making organs, develops the egg cells in the ovary so that you get more eggs, no matter how cold or wet the weather. Mr. Bonner's experience is proof of that.

PREVENTS AND CURES COLDS-ROUP-CHOLERA
POULTRY TONE overcomes and expels all germ poisons. It combats the germs that cause Roup and Cholera and it tones up the system so the chickens can resist disease. It affords prompt and permanent relief.

MONEY-BACK GUARANTEE

POULTRY TONE is a real Poultry remedy and tonic. Always sold on money-back guarantee if not satisfied. On the market 20 years without a single request for refund. Try Poultry Tone on this plan. You can't afford to be without it. It's a sure money-maker for you.

Price, 50 cents large bottle; quart can, equals ten 50 cents bottles, \$2.50, prepaid. Send for big circular Poultry Welfare, it's free. Send your order today.

Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

Winter Eggs.

First Prize Article.

I am but an amateur at the poultry business, but have followed it closely for the past six or seven years through pages of the American Poultry Journal, the best authority I know of. In the six years that I have been interested in poultry I have had as many different kinds, but after seeing a flock of Ancona hens in full feather I was convinced that that was the kind I wanted to raise.

On March 1, 1920, we ordered two settings of eggs which were placed in a small incubator, hatching eighteen chicks on March 26. There were ten pullets in this lot and I got five more from a setting in May. We received our first egg on August 14, which was just 141 days from date of hatch, although I find that this is not an unusual occurrence in this breed of chickens.

From the middle of August on the pullets continued to lay, not stopping to molt as some pullets do which start to lay early in the season. On December 1 they were penned separately in a coop, not being allowed the freedom of the run at any time, as one cannot expect eggs in the winter if the hens have to run in a wet muddy yard or in the snow.

The following rations are fed regularly. A wet mash in the morning, sprouted oats at noon, also suet on cold days, and scratch feed just before time to go to roost at night. Water, oyster shells and grit before them at all times. The water is placed over a heater so that it never freezes. The heater I made myself, using an oil fount of one quart capacity with a burner taking a round wick a little smaller than an ordinary lead pencil. The lamp is then set in a tile for safety sake, and by turning down the flame as low as possible and lighting same every morning and turning it out at night when the water pans are emptied it will run for two months on one quart of oil. The heat is not sufficient to make the water very warm, but just keeps it above a freezing temperature.

The mash is made to conform with one used by the Missouri Experiment Station, viz., three pounds of bran, three pounds of middlings and one and one-half pounds of beef scraps. Beside the wet mash mornings, this mixture in a dry form is before them all the time in hoppers. For a scratch feed we use three pounds of corn and one and one-half pounds of heavy oats; in the summer we feed less corn and add wheat to the scratch feed instead.

We cannot speak too highly of sprouted oats and suet for cold weather feeding, the sprouted oats taking the place of the usual green stuff that chickens get through the summer season and the suet as a preventative of frozen combs. My chickens have been in an open front house through all of the cold weather without a single frosted comb. Would not advise feeding over half a square inch of suet per bird at one feeding.

The scratch feed is scattered in a deep litter of straw and there is always enough grain left in the litter when they go to roost to keep them busy the next morning. We have found it a good point in poultry raising to keep the hens busy all the time.

Our house is a small semi-monitor type 9 feet by 12 with south side one-third open and the balance glass. Ventilating window at top always open. The nest boxes, water pan and feed hoppers are elevated allowing all floor space free. There is a dropping board under the roosts which is cleaned at least once a week in cold weather and oftener in warm weather.

For the month of January, 1921, we received 170 eggs from the fifteen pullets or an average of eleven and one-third for each pullet. As the average per pullet for the month of January at the Connecticut Laying Contest for the last five years has been only nine eggs we feel real pleased with our record. We do not want to appear conceited and are willing to give climatic conditions full share of the credit, as we have had some remarkably mild weather for this time of the year. Account of other duties we are unable to trapnest, so we have some real good foundation stock.

We have installed electric lights in out houses for the coming winter, as they are no longer an experiment and have been proven a big aid to securing winter eggs. We feel sure that any one can experience real satisfaction with poultry if they just get good standard-bred stock and then give it good care.

In conclusion, wish to say that the market value of eggs layed in January last was \$6.96, the cost of feed was \$2.34, with a net profit of \$4.62, or 30 cents for each pullet. Every one should be equipped and ready to produce December and January eggs this year.

Ohio.

F. C. Ensigen.

Prepare for the Cold Months.

Second Prize Article.

We all know that we should now be prepared for winter and, no doubt, the majority of us have everything in good order for winter.

This cold season may not be so easy on our flocks as was last winter. I do not mean to forget those days when the mercury was below zero, and a wind was blowing, but continued severe weather with rough storms and deep snow did not show up in my locality and, if I understand rightly, you poultrymen in central and western United States had an easier winter than usual; at least as far as caring for your flocks went. We were thankful for this, although in my territory there was scarcely snow enough on the ground to permit convenient hauling of wood. Even in the woods, snow was scarce and the hauling rough.

It is hardly likely that the coming winter will be a repetition of the last, so all of us who have a pen of fowls

Seattle, Wash., Nov. 2, 1921.

Dear Atkinson:

Pen you sold me finished second in Second Western Washington Egg Laying Contest with an average of 270 3-5 eggs and also won Best Hen, with an individual record of 313 eggs. Pen was leading August 30th when one pullet died and the reserve pullet's eggs did not count until October 12th. This fact I believe cost me First place. Yours very truly, J. W. Merriman.

Another 300-Egger.

Seattle, Wash., Nov. 2, 1921.

Hollywood Farm—Gentlemen:

Our pullet that laid 301 eggs and won Second Best Hen at the 1920-1921 Western Washington Egg-Laying Contest was hatched from your eggs, am pleased to state.

Highmont Poultry Farm.

By J. A. Pease.

And Still Another.

To the Public:

H. L. Willis, of Mt. Vernon, Washington, gives us permission to state that his pullet, No. 64, that laid 302 eggs at the Second Western Washington Egg-Laying Contest, was hatched from eggs he purchased from us.

(Signed) Hollywood Farm.

THE GREATEST OF ALL LAYING STRAINS

BY OUR thousands of satisfied customers and our winnings year after year in official Egg Laying Contests we have proved absolutely that Hollywood has the GREATEST OF ALL LAYING STRAINS. This unequalled record has been made by us not with one or two winnings in dozens of trials, up one year and down the next, but by consistently winning, year after year, in all parts of the United States, from ocean to ocean.

WE HAVE FOR SALE the finest lot of BREEDING COCKS, COCKERELS, HENS, PULLETS and MATED PENS ever offered to the American public. All of them are closely related to our contest winners. Circular and price list free to any address on request.

BABY CHICKS—EGGS FOR HATCHING

Baby chicks for sale in season, within safe shipping distance. Hatching eggs expertly packed and can be forwarded to any point in the United States or Canada that may be reached with reasonable promptness by either parcel post or express. Extra care given to long-distance shipments. But Please Place Orders As Early As You Can, which will be of help to both of us. Help Us To Help You. Circular and price list mailed free on request.

DES MOINES INCUBATOR CO., 1 Second St., Des Moines, Iowa

29 years of big successes prove that the "Successful" is the incubator you want to insure your success this year. Write for my 1922 offer.

Wipe Out Every Rat and Mouse

Amazing New Discovery Quickly Gets Every One. Not a Poison.

Don't be satisfied with trapping or poisoning just a few. Exterminate the whole bunch—old, young, big and little. Rats do millions of dollars' damage each year. They kill chickens, destroy grain, damage buildings, merchandise, and are filthy disease carriers.

A wonderful new scientific discovery called Imperial Virus now enables you to clear your place of every rat on it. The amazing feature of it is that it is not a poison and affects rodents such as Rats, Mice, Gophers, etc., only. It is perfectly harmless to humans, stock, poultry, pets. It can, therefore, be spread anywhere knowing it will kill only the pests you want to get. One rat affects the others and in a short time the whole colony is exterminated, root and branch. They die outside, too, hunting air and water.

You Can Try It FREE

The manufacturers of this amazing Virus, to get it quickly established and widely used, are making a Special Guaranteed Introductory Offer of two regular, big, full sized (double strength) \$1.00 bottles, for the price of one. Use one yourself and sell the other to a neighbor, thus getting yours free. They will also tell you how you can make money telling your friends about it. As this offer may not appear again, you should act at once or clip for future reference.

You need send no money; just your name and address to the Imperial Laboratories, Room 245, 2110 Grand Avenue, Kansas City, Mo., and pay the postman \$1.00 and a few cents postage, when the two bottles arrive. It costs you nothing if it does not do the work, as they positively guarantee to refund your \$1.00 any time after 30 days if you are not satisfied.

WHY EVERY BREEDER SHOULD INVESTIGATE "VIKING" Rhode Island Whites

BECAUSE R. I. WHITES ARE

1. The World's Greatest Layers—Absolutely.
2. They Take Rank with the Best of All Market Fowl.
3. They Are So Easy to Raise.
4. They Are the Coming Most Popular Strain of Poultry.

EDGEWOOD POULTRY FARM
R. F. D. Box 18 PLANTSVILLE, CONN.

must make sure that we are prepared for all kinds of weather.

In this case we will feel much easier about our fowls. For we know that poultry must be as comfortable as possible in order to give us the greatest returns.

I would first advocate the repairing and general fixing up, if needed, of our poultry yards. If we leave this until spring we may be in such a hustle with other work that the yards will go neglected just long enough for fowls to get out and destroy a part of the wife's (if you have one) flower garden, or young chicks get through and wander about until they are lost, giving us care and bother.

We must straighten and drive firmly into the ground all leaning posts. If a bottom has worked its way loose from the pole it should be nailed firmly thereto.

Rotten bottoms and poles should be replaced by new ones. In the rush of spring work such pieces might be allowed to stand, as we would think that they would last one more season.

Sagging wire ought to be stretched and stapled firmly. Any holes or openings under your yard? If so, wheel a few heavy sods and pack firmly on both outside and in. Is there a place in the yard that the wire is low, where that pesky white biddy persisted in flying over during the summer? If this place is between two poles only, it may be fixed by nailing on cedar poles six or eight inches apart. If the poles, or hen yard posts, I should say, are too short for this, just nail on pieces of sufficient length that will accommodate the desired number of cross poles that you wish to put on. Mend any holes or openings in the wire. If any staples have pulled out for any reason, new ones should take their place. Any stretch of wire that is nearly rusted to pieces should be either replaced now or marked in such a fashion that we will be reminded of it in the spring. There is a reason for not putting up new wire in the fall, on account of the winter weather tending to wear on it. It must be seen to in the spring, though, before the fowls are turned out.

Now if we have done all of this work our yards are in good condition and so much less needs to be done in the spring.

We will appreciate this when the time arrives and pat ourselves on our backs for fixing up things in such good shape, even if it was a long way ahead. Ounces in the fall are worth pounds in the spring.

Now the yards should be cleaned up in good shape. Any branches, pieces of boards or poles, boxes, and all such material should be cleared away. That which is of any use may be put away for the future, while the other will find a suitable place in the kitchen stove.

How many of us have our yards plowed in the fall? Do you not think that fall plowing is the right thing? The ground thus turned over takes no harm during the winter, and is all ready to work on when we have a spare part of a day in the spring. So we may be so much ahead if this work is done at this time.

Take a good look at the outside of the pen from all angles, including the roof. Any loose shingles should be nailed and old ones should be replaced by the new.

Stop Colds and Roup in Your Flocks

The wheeze of a fowl with roup or cold will surely cost you money. The chickens you buy don't bring profit, nor do wheezy, droopy, stunted fowls, make weight or eggs. Save losses—Gain profit. Use cleanest, simplest and most economical method to stop colds and roup. With

ZENOLEUM

Disinfectant Vapor your flocks get well and stay well. Zenoleum is used and endorsed by 61 Agr. Colleges.

Dr. Koch, famous poultry expert says: "Zenoleum Vapor method has proven a positive preventive and cure of all diseases peculiar to the nose, throat and lungs of poultry. I know its merits after 3 years thorough trial."

RHODE ISLAND RED JOURNAL

Devoted Exclusively to R.I. Reds. Published monthly. Official organ of Rhode Island Red Club of America. One year 50c, three years \$1. Rhode Island Red Journal 1931 E. Bremer Ave., Waverly, Ia.

Loose nails in the corner and end boards should be driven in.

Any loose panes of glass in the windows must be tacked and puttied and then painted over the putty.

Can you afford to paint the trimming boards? If not able to buy the ready mixed paint, purchase some oil and ochre, also a little japan. Two quarts of oil, two and a half pounds of ochre and a quarter of a pint of japan will make over two quarts of paint and it will go quite a distance.

In my town the latter part of June we purchased a gallon of oil, five pounds of ochre and one-half pint of japan for \$1.73, I think.

Only the regular paint oil should be used, of course. The ingredients should be mixed thoroughly. It isn't necessary to mix the whole amount at once. Take a quart of the oil, a pound and a quarter of ochre and about two tablespoonsful of japan. Mix together well and stir until there are no lumps. It is made in a very few minutes.

Now, after these boards are painted, or probably it would be better before, whitewash the front, ends and back of the pen, putting on two coats. Use the government recipe for making the wash or any method that has proven of good lasting qualities and nice and white.

Some rainy day notice the roof of your poultry house on the inside, and if a leak is discovered, promptly patch it on the outside.

Now wash the windows inside and out with a good cleanser and then, if you think necessary, bank the building for the winter.

Over the banking place some fir boughs of good size, not too large.

It is all fixed up in good shape now, fit enough for us to move into.

Now for the inside.

First, the walls and roof should be swept, taking away all the webs and other dirt. The litter must be removed from the floor, the latter swept clean, and the litter taken to some out of the way place and burned. Spray the interior thoroughly with a good disinfectant, or smoke out the building with sulphur.

Now whitewash the inside, two good coats.

We may put a very thin layer of sand on the floor and then a half foot of oat straw or some such material for a scratch litter.

The droppings board may be placed two feet from the floor at the rear or in one end of the house. If they are matched boards, all the better.

Roosts are either stout poles, peeled, or 2x3 inch stuff, edges rounded. They are placed in a hinged frame that lifts up, or else are put in so they can be taken out altogether.

Place them eight inches or a foot above the droppings board, one foot apart. You can tell by the size of your pen and flock how wide the droppings board should be and how many roosts are needed.

Now, if your fowls are going to have dry mash before them at all times, a good wall hopper can be made by yourself. This needs no back, as the wall of the pen serves this purpose.

Of course it is not necessary to have a particular kind of hopper. Make or buy one to suit yourself.

Small boxes will serve the purpose of grit and shell containers.

Order Your Leghorn Chicks for Next Spring

FOR FIRST HATCH, FEBRUARY 13th

The past season has probably been the most successful in the entire poultry business which means a big rush for chicks next Spring.

Who Are You Going To Buy From?

This is the most important decision you will have to make in 1922. We, unhesitatingly, tell you, we don't think there is a Farm in America that could sell you 100, 5000 or 50,000 chicks as uniform in quality as the Lord Farms. You can't afford to buy low priced chicks to be successful in this business.

Breed and sell one strain of birds, not a picked up mess from all over the Country. For years and years we have been building up this strain and believe we have the best all round Leghorns, produced and sold in large quantities, in this Country. We have thousands and thousands of breeders, and each bird on our Plant is State Tested for White Diarrhoea. Besides that they have been breeding for size and large egg production for over ten years.

We Sell Our Chicks In Three Grades

SPECIALS—Only a limited number of chicks for sale from these matings, 50c each in any quantity.

GRADE A—The grade of chicks that has made our Farms famous. The kind that have made thousands of Poultrymen successful. \$28.00 per 100; \$27.00 in 1000 lots.

GRADE B—The same strain as our Grade A and our Specials but from younger stock and not so well selected. \$25.00 per 100; \$24.00 in 1000 lots.

Breeding Cockerels and Cocks

We have some fine utility birds at \$7.50 that are bred from our best laying stock. They will put stamina and vitality into your flock. Discount in quantities.

For special breeding we have limited number of exceptional birds. They have size, good looks, and have the egg records behind them. Price \$10—and \$15.

Our new catalog of 80 to 100 pages will be out about Jan. 1. Write for one of these—the most instructive and educational catalogs published.

Supremacy

AT NEW YORK STATE FAIR September, 1921. Competing against several of the greatest breeders in Eastern States, won 4 times as many Firsts as next nearest competitor and every Second prize competed for Twice $\frac{1}{2}$ in same class. Display Championship by 282 points majority. At OHIO STATE FAIR September, 1921. They made a "Grand Slam," winning every First and Second. Grand Champion male in entire show. AT CHICAGO COLISEUM SHOW December, 1920, as many Firsts and as many Seconds as all competitors combined.

An elegant lot of show birds and breeders that will reproduce in either young and old await your immediate and future requirements. (Special this month see classified advt.)

Mayslake Farms, Dept. A, Hinsdale, Ill.

F. S. PEABODY, Owner. F. F. CONWAY, Manager.

If you are planning to feed a moist mash occasionally a trough may be made that will hinge to the wall or studding, so it may be cleaned and turned back after using it.

As for the nests, you may make them the way that you like them. In case they are to be put underneath the droppings board the latter will have to be two and a half or three feet from the floor. If they are to be put against the walls it may be well to have them in the darkest part of the pen. They should be so situated as to be easy to clean and to get the eggs.

A water fountain of the non-freezing type is the next thing, and then I do not see but what we are all ready for the pullets.

Have you got them all picked out Yes, I thought so. It is a fine home we have for them, and I see no reason why they should not be satisfied. Do you?

Maine.

Augustus S. Carter.

Artificial Lighting.

A great deal has been said in connection with artificial lighting of poultry houses during the winter period, and inasmuch as we have had quite a success thought perhaps others would be interested and benefited by our experience.

Last winter we had 36 White Leghorn pullets which we hatched (with the use of an incubator) April 1, 1920. We had set 103 eggs, hatching out 93 chicks. Some of the baby chicks were sold and all of the cockerels were sold, leaving us just 36 pullets. These pullets started to lay August 26, 1920, being 4 months and 26 days old.

During the month of September, 1920, we received 300 eggs. During October 504 eggs and during November 375 eggs. When the production fell so low we decided to try the electric light and the first of December the light was turned on at 4 o'clock in the morning and left burning until daylight. We believe our efforts were rewarded since the month of December showed a total of 567 eggs, or a gain over the previous month of 192 eggs. The first eleven days of January they laid 245 eggs, or an average of 22.2 eggs per day. On January 10 we received 28 eggs.

In addition to the electric light we feed a balanced ration and do not believe in feeding table scraps. The morning meal at 4 o'clock is grain. This is thrown in the litter the night before, after the hens are on the roost. The evening meal is also grain and fed about 4 p. m. Then at noon they are given a pan of sprouted oats. A good dry mash is always before them as well as fresh water, grit, oyster shell and charcoal. These 36 pullets consume 100 lbs. scratch feed and 100 lbs. mash each month.

Another thing we believe is essential is plenty of fresh air, but no draughts, and a regular time for feeding. We try to feed at the same time each day.

The hen house is made as attractive as possible. The inside being entirely white and the dropping boards cleaned once a week and fresh litter placed on the floor and in the nests each week. A constant war is waged against mites and lice.

Missouri.

Chas. B. Sutterer.

THE GUARANTEE ROUP CURE was discovered on our breeding estate, where we breed registered Holstein Cattle, Spahr's Giant Epchal Berkshire Hogs, and our world's famous NONESUCH, Ferris White 300-egg strain leghorns. After losing several thousand dollars' worth of our valuable birds, we were determined to discover a cure for Roup, Colds, Canker, Diphtheria, Chiel-en-Pox, etc. After discovering and using "SMOKE EM," (canned smoke) we have not lost a bird. WE POSITIVELY GUARANTEE "SMOKE EM," (canned smoke) to effect a complete cure or every cent of your money back. Read what Mr. Jos. W. Smith of Burbank, Calif. says: I have tried "SMOKE EM," (canned smoke) and I know it does the work." Mr. Chas. Brantner, Polo, Ill., R. No. 7, writes: "SMOKE EM" surely is the best thing we have ever tried for Roup, Colds, Canker, etc. It is an absolute cure." Ex-Judge A. W. Ecker, of Woodboro, Md., says: "I have used "SMOKE EM," GUARANTEE ROUP CURE, and find it a very excellent remedy for Roup. I used several remedies but "SMOKE EM" was the only one that produced an absolute cure." Thousands of unsolicited testimonials on file at our office. Mr. A. L. Crowell, 422 East Fisher Street, Salisbury, N. C., says: "SMOKE EM" cured my chickens and GUARANTEE DOUBLE HEALTH AND EGG PRODUCER put the pep in them."

Buffalo Announcement

Buffalo Incubators and Brooders for the season 1921-22 take their customary place as leaders in each class.

Buffalo Incubator is offered you today made the same as when it was introduced more than twelve years ago. It was so nearly a perfect hatcher in the first place that we have never had to change it.

Regular Buffalo Incubators are of 60 egg, 120 egg, 240 egg, and 360 egg capacity; and are, in every particular, just as thoroughly well constructed as the more expensive standards. Buffalo walls are heavily packed; the heat control is absolute; the ventilation is diffusive. No element is lacking that makes for ease of operation or for efficient results. Thousands of expert poultry raisers endorse each season the report of the leading Government Experiment Stations at home and abroad. "BUFFALO IS IN EVERY WAY THE BEST HATCHER."

In 1913, when the Buffalo was new, Prof. A. W. Richardson, already famous for the success of his students in Poultry Culture, was then in charge at State College, Pa. He ordered a Buffalo, and at the end of the season gave it his unqualified endorsement. When he went to Maine University he promptly put in the

Buffalo outfit. Later on, having been sent to New Hampshire University, he completed the equipment there by adding Buffalo Incubators and Buffalo Brooder Stoves. He found them unchanged—still, in every particular "Best." Under date Nov. 5th, last, Prof. Richardson wrote to us:

"We will need to buy six or seven of the No. 3 Buffalos this season. Our students use them here for two hatches and some of them wish to take their Buffalos back home."

Buffalo Coal-burning Brooder increases in popularity as its real superiority becomes evident. The adjustable hood, which may be set at any height over a range of 16 inches according to the weather or the age of the chicks, is its distinctive feature.

Buffalo "Never-Out" Oil-burning Hover is heavy cast iron, accurately machined, and will last a lifetime. It was not possible last season to get tooled up with this Hover for quantity production; but there is a plentiful supply for this year.

Illustrations of the Never-Out Burner; and of the new Buffalo Electric Mammoth (Sectional) will be shown in the next issue of American Poultry Journal.

TRADE
THE MARK OF QUALITY

DON'T KILL HER

Because she is not laying. Maybe it is not her fault. A hen is an egg factory. She takes raw material and manufactures eggs from it. Give her a food that contains material for 25 yolks and 100 whites and she can lay but 25 eggs. Balance that ration. Give her material for 100 yolks as well as 100 whites. You can learn about it in our book

Feeding for Egg Production
Tells how and what to feed for best results. No matter whether you keep ten hens or ten hundred, you cannot afford to waste high priced feed. This book is given free as a premium with one year's subscription to POULTRY KEEPER for 50 cents. You need POULTRY KEEPER too. It is chock full of practical information on how to make poultry pay. The book and paper will both make money for you. Send 50 cents at once for a year's subscription and get "Feeding for Eggs" free. Address, A. OTIS ARNOLD, Dept. 54, Quincy, Illinois

R. E. SANDY :: STUARTS DRAFT, VA.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

Would like your opinion of the following proposition. We live on an irrigated farm and find the work too heavy by reason of the after hours' work taking care of the water. We are raising alfalfa, flint corn, which we hog down, and sweet clover which we pasture with ewes and early dropped lambs. Also W. Wyandottes. Besides the heavy work we find we are badly handicapped by distance from market and we are anxious to make a change where these factors can be eliminated.

Do you think a location could be found in New York State or in that section of the country anywhere that this same type of farming could be carried on. What about the "abandoned" farms in that section of the country. Could get away from here with ten or twelve thousand dollars, which ought to be enough to start along this line if land don't cost too much. Have you any suggestions to offer about locating such a place without the probability of getting "stung" by real estate men. A personal hunt would be pretty expensive.

W. F. Rhodes.

A farm for the purpose of which you want to use land can be purchased in New York to good advantage at a price ranging from \$50 to \$100 an acre. The land about Syracuse is particularly adapted to the raising of aflalfa. The "abandoned farms" of New York are very scarce and they are hill farms far removed from public highways and land which should have been allowed to remain in timber. Do not buy land until you have inspected same.

I expect to put out a small family orchard next spring and would appreciate your advice as to the best varieties.

This is a red clay foundation with lots of small rocks. The soil is very thin; in fact, the land is poor, this being a mineral district of iron and coal.

The ground in question is slanting to the south. This section is 240 ft. by 180. I expect to have chickens.

Alabama. Mrs. Wm. Harris.

You can not find room for many fruit trees on your limited space, after residence and outbuildings are completed and you will find the Henry Clay apple particularly well adapted to your climate and soil. Also the Dutchess and the King David. A few Early Elberta, Elberta, J. H. Hale and Krummel peach trees should be planted. You will find it to your advantage to plant plum trees in the poultry yard. Select America, Gold, Endicott and Abundance. You will want as much small fruit as possible.

I have a few plums, pears, cherries, and apricots, put out last year, and would like to know if I should spray them this fall, and what time and what kind of spraying material I should use. Also what kind of manure to fertilize them with as I have lots of chicken manure.

We have an old orchard that has mostly died out and the land is poor where it is. Now could a man dynamite the ground where the old trees have stood and also where we are to put trees the following spring, and then put manure on the places we dynamite and let it lay until spring and then set out trees there? And what kind of manure would be best?

Would you please tell me the best twenty apple trees to put out so as to make early, medium, and late apples?

Indiana. L. B. Spencer.

Your trees should be sprayed with Scalecide early in the fall, when dormant, and again in the spring before growth starts. Put this material on

trees when temperature is not lower than 40 degrees.

I am very anxious to get all the reliable information that I can about western North Carolina. I would like to buy a small place somewhere in the vicinity of Ashville. Do you know of someone in the city of Ashville to whom I could correspond in reference to that section.

California. E. J. Haley.

Write the Ashville, N. C., Chamber of Commerce.

I understand that the State of Idaho is offering for sale irrigated lands on attractive terms. Can you tell me anything about climate, crops, markets, etc., in this region? Is it a good fruit and poultry country?

I own a small farm near the town where I am employed, but do not believe it large enough to make a living from without more capital than I have, and would like to sell it and locate somewhere in a regular farming country. I have had farm experience, especially in handling dairy cows and poultry.

I have a large family of small children and some of them old enough to be of considerable help on a farm. All of us good workers and not afraid of conditions in a new region. As my place here is near town and well located it would bring from \$5,000 to \$8,000 net. Do you think it would be sufficient capital to get a start on the Idaho irrigated land? Thanking you in advance.

West Virginia. L. M. Johnson.

I cannot understand why you wish to remove from West Virginia to Idaho. There as good general farming lands in West Virginia as can be found in any state in the Union. For stock raising West Virginia is especially desirable. Here are the rich valleys, with the best blue grass in all the world, pure water and a timber belt. The open season is long and favorable. The best markets obtainable within easy reach. As a fruit section West Virginia is exceptionally favored. Consider very carefully all this before removing from your present state.

As you are acquainted with poultry conditions in Florida thought would ask a question or two.

Is there any money to be made in the broiler business, say from November or December to April, and is there a good Florida market for them?

Have been in the poultry business for some years and was wondering if one could at least make expenses and escape some of the cold of this section during this period. Very truly,

New York. W. H. Robinson.

Many men are finding the production of a limited number of broilers and eggs profitable in Florida. During the winter months there is a big demand for broilers and fresh eggs at the resort hotels. The production of broilers and eggs for shipment to the north is very questionable. I know one man who has built up a very large and profitable production of squabs. This shows how everything in this world gets back to the man. This man produces these squabs, buys all the feed, and ships them a distance of 1800 miles to New York at a profit. Not long ago I met a man within 60 miles of New York who failed in the business of producing a squab for the New York market.

I know beyond all doubt that a combination of fruit and poultry in Florida is a winner—for the right man. I

The Egg is $\frac{3}{4}$ Water

Heavy Drinkers are Heavy Layers

Each hen must drink one-fourth pint water every day to produce high priced winter eggs. *Water must be warm.* Hen's temperature is 110 degrees F. Don't let your hens drink ice cold water a single day this winter, for it will chill to the bone and may stop egg production a whole month. Why permit unnecessary loss when the

EUREKA Sanitary Non-Freezing FOUNTAIN

KEEPS WATER WARM 24 HOURS

No lamp, no fire, no danger. No upkeep. No trouble. **Only up-to-date Sanitary Fountain.** Drinking cup does not project beyond outer can. No possible chance to catch litter or filth. No contamination to cause disease. **Water always warm, clean and pure.**

Made of heavy galvanized iron. Built like fireless cooker. Works like thermos bottle. Simply fill every evening with hot water—that's all. Hens will have plenty of pure, clean, warm water early in the morning just when they want it and need it most.

Water is a natural tonic just as important as feed. Get full value from high priced feeds. Increase egg production and profits by keeping warm water before your hens all the time.

The heavy drinkers are heavy layers. 100 layers will drink 12 to 15 quarts of water a day. Just think of it! The egg is three-fourths water! Every hen you have must drink one-fourth pint water every day or she cannot produce. Only warm water can be consumed in this quantity, in cold weather. **The water must be as nearly clean, pure and fresh at all times as the water you drink yourself.** This cannot be done with open containers. The **Eureka Sanitary Fountain** is not a luxury. It is a necessity—a year round fountain. It keeps warm water warm in winter and cold water cool in summer.

READ WHAT SATISFIED USERS SAY

Could Not Get Along Without "Eureka" Fountain

Gentlemen: I am writing to say that I purchased two of your Eureka Non-Freezing Poultry Fountains and they proved entirely satisfactory. They are certainly fine. I could not get along without them now.—Freeland Irish, R. R. 1, Royal Oak, Mich.

Provides Good Water at All Times

Gentlemen: Your Eureka Fountain has been in use now for several months. It is a great convenience as it provides good water at all times with very little bother. It should last a long time for it appears to be well made.—H. L. Doty, Linn Grove, Iowa.

Entire Satisfaction Both Winter and Summer

Gentlemen: Your Non-Freezing Poultry Fountain has given entire satisfaction both winter and summer. Should not like to do without it.—R. E. Pethick, Payntelle, Pa.

More Than Pleased—Good Year Around

Gentlemen: Last April I bought three of your Eureka Fountains and I am more than pleased with same. They are good the year around. I want more of them soon.—G. Y. Posey, Nash, Okla.

Perfectly Satisfactory—Orders Another

Gentlemen: Having used one of your Non-Freezing Fountains for two years I find it perfectly satisfactory. In fact I liked it so well I purchased another last spring and am getting good results.—H. Clay Beitler, East Millstone, N. J.

Baby Chicks

No more chicks for this year. We shipped over 400,000 this year. Incubator capacity 10,000 eggs each day for 1922. 1000 S. C. White Leghorn cockerels for sale, Barron strain. Our 32-page catalog will be ready for mailing in December. It is free for the asking. Missouri Poultry Farms, Columbia, Mo.

advise you to write to E. W. Brown, De Land, Fla. Mr. Brown is one of the fellows who has made good down there and you can take every word he tells you as "gospel truth."

As I am going to start raising poultry I am trying to find what will be the best for eggs and show. I am thinking that the Campines are a good bird and want to know if you know anything about the White Campines that are advertised by the Nabob Hatcheries, Gambier, Ohio, what they call the Cheviot Strain, produced by the Cheviot Farms, and say they are true Campine type. Can you tell me if the White Campine is such a wonderful bird and is it a coming bird for commercial egg plants. Herbert Jacob. Massachusetts.

I know nothing as to the merit of the White Campines. Most of the successful commercial egg plants of the country use White Leghorn. The White Leghorn is also a popular show fowl. I am of the opinion that you will make no mistake in selecting the White Leghorn. (There is no earthy excuse for a White Campine. We will have something more to say editorially next month on the wholesale production of new varieties.—F. L. P.)

I am interested in a small apple orchard and small fruit and would like to have you advise the best book to purchase that will give understandable information on spraying apple trees, time to spray, what to spray with, care in general, pruning, cultivation, etc. Same information about cherry and peach trees, also small fruit. The best book or books on fruit tree and small fruit grafting or budding. Your personal advise as to best spray for apple trees and when to spray. Same for peaches, cherries, and plums. Indiana. E. A. Sallett.

You should secure a copy of "The Apple Orchard." This will give you all information covering the planting, care, spraying, etc., of apple trees. "The American Fruit Grower" is another book you will need. It contains all desired information regarding the care of fruit trees.

For years I have sprayed my fruit trees with Scalecide, in fall and spring when trees are dormant. For eating insects I use arsenate of lead. For aphids, etc., I have used Black Leg 40 with success.

"Propagating Fruit" is also a book you should buy. You will find therein information about grafting, budding, etc.

I have read in a certain farm magazine about the poultry industry at Barnum, Minn., and would like some information concerning the place.

Do you think it a good place for the poultry business or would you advise a man to go farther south. Have read quite a lot about southwestern Missouri as a poultry section, but am afraid of the hot weather. North Dakota. E. G. Osborn.

I would advise you to make a personal inspection of the two sections you name. There are many advantages in each section, but I would consider southwest Missouri as a very favorable location for the production of market poultry and eggs. Although well to the north, White Leghorns are kept at Barnum, and the town has come into prominence as a result of a successful cooperative marketing system on the part of the Barnum Creamery & Poultry Co.

I noticed in last month's issue that you are well acquainted with Florida. I am anxious to learn something about Valparaiso, a new city fifty miles from Pensacola. Very attractive offers are being made by a develop-

ment corporation of that city to induce people to go there. For \$1,000 you are offered a villa and ten acres, the further payments of \$4,000 to be made out of the profits from the land. The company offers to farm the land and market the produce on a 50-50 basis until you are ready to go there and take it over. Large profits per acre are promised, the crops to be sugar cane, peaches, figs, pecans, blueberries, etc. A new fertilizer called Hufteria—a mixture of humus, fish and bacteria—is to be used and will apparently work wonders with the crops.

What I would like to know is whether these plans will work out according to promise or is the whole scheme likely to strike a snag and go under. It is endorsed by the Editor of the Farm and Live Stock Record, published at Jacksonville, a whole issue of that paper being devoted to boosting Valparaiso.

Would you advise me to invest my money in this scheme?
S. A. Cross.
Canada.

I have been spending several months in Florida each season for the past eighteen years and have seen hundreds of these development schemes worked to the success of the promoter. I know nothing about the plan or the merit of this particular offering, but as a business proposition I advise you to buy land outright if you are to locate in Florida. From what you say I realize that the offering has the usual alluring promise of great financial returns to the investor. Do not buy an acre of land in Florida or elsewhere without making a personal inspection of the land.

It is my opinion that in the "Blight-Resister" (Norton), Stark Bros., Nursery and Orchard Co. of Louisiana has secured a tomato which is relatively as important to the truck grower and to the person who wants to grow tomatoes for home use, as the Starks Golden Delicious apple was to the home orchardists. Stark Bros. wrote the Department of Agriculture at Washington, D. C., asking if the department had any reports on the Blight-Resister (Norton) tomato. Prof. Fred J. Pritchard, physiologist, in reply, sent Stark Bros. a very large number of reports on this tomato. These reports were by truckers and homegrowers in nearly every state in the Union. All agreed as to the blight resistance of the Norton and to its high quality.

A Problem in Color Breeding.

White Minorcas are again coming to the front, a pullet, one of the best I have seen, was in evidence at the Brighton Show. Some breeders will be surprised to learn that this pullet was bred from blacks. I have seen six of her sisters. I can only describe them as gems of the first water, white legs, ivory in fact, snowy, silky plumage, white kid glove like lobes and a face in splendid contrast to the white, and bred from blacks! Here is a color study for the thinker. This problem, to be solved; must give the writers on double mating, pullet breeding and other knotty questions some headache.

It is also strange that it only occurred in the pullets. I am a student of color. I breed flowers as well as fowls, but this white business in a black breed puzzles me; what is more, if a White Minorca, bred from blacks, was again bred from, it would throw blacks. But if bred to a Black Spanish it would throw blues. This is not theory. I have done it. All this goes to prove that we have a lot to learn in regard to color breeding.—Poultry Australia.

**MAKES
BIG HIT
WITH
POULTRY
RAISERS**

BUYING FEEDS

The ever increasing popularity of our "direct from mill to user" plan of buying poultry feeds is proof not only of its many saving advantages but also of the fact that, poultry raisers have found Basic Feeds to be exactly what we claim for them, namely—**100% Quality Feeds.**

When such successful men as P. C. Sciarra, Hillview Farms; G. S. Beyers, Hazelrigg, Indiana; F. L. Brace, Medina, N. Y.; Fred Warren, Mt. Ephraim, N. J.; E. D. Taylor, Kalamazoo, Mich.; and hundreds of other prominent poultrymen in all parts of the country tell us that Basic Feeds and our "direct from mill" plan of selling is one of the big factors of their successes, it is pretty good evidence that you will find our feeds and our money saving plan more than satisfactory.

BASIC FEEDS

FOR POULTRY

The reason Basic Feeds produce such wonderful results for poultry raisers is because they are composed of the best feeding stuffs the market affords. There is nothing

added to make bulk nor to cheapen the product so it can be sold at a price. We simply put into the feed choicest Basic Feeds, properly milled, blended and balanced according to formulas that have proven by various tests to be best for the purpose intended. The only reason Basic Feeds cost less is because we sell "direct from mill to user." The combined profits of middlemen, the heavy expense of traveling salesmen, are entirely eliminated. The retail dealer's selling expense, overhead and profit, while adding enormously to the cost of your poultry feed, do not add one cent's worth to its value. This retail selling expense and profit must be included in the retail price *you* pay for any feed or the quality must be reduced while the price remains the same.

Our plan of selling "direct from mill to user" enables us to save you this added expense and we are able to give you the finest quality feed that human skill and science produce at prices considerably less than feeds bought in the regular way.

BASIC FEEDS CO.

DIRECT FROM MILL

BETTER FEEDS FOR LESS MONEY

In the Basic Feeds line will be found every feed necessary for poultry from the day old chick to the matured fowl. The formulas used in our various feeds are standard. They are the result of many years' experience and extensive tests made by leading poultry experts. They have proven to be the best combinations of feeding stuffs that have ever been made for poultry of all ages. We maintain the formulas and high quality of the ingredients all the time—never changing or sacrificing the quality to meet a price. We would, just at this time, call particular attention of poultry keepers to our Laying Mash. As an egg producer it is unexcelled. Poultrymen who begin now to feed Basic Feeds Laying Mash will find that their young pullets and laying hens will produce eggs this fall and winter in greater quantities than they ever dreamed possible. This is because our Laying Mash is composed of just the proper ingredients to produce eggs. Keep it before your fowls where they have free access to it all the time, and you will be agreeably surprised at the eggs your flock produces.

Write for FREE Sample Descriptive Folder and Price List

Fill out and mail coupon in this advertisement—send it to us and we will send you free sample of Basic Feeds, in order that you may note its superior quality and texture as compared with other feeds on the market costing equally as much or more. We will also send you free and postpaid our catalog folder, describing the complete line of Basic Feeds and with it our money saving "direct from mill" price list.

If you are interested in securing the best possible results from your poultry—if you are interested in securing the best poultry feeds the market affords at prices exceedingly low, when considering the results they produce, then you owe it to yourself to fill out and mail the coupon and get our descriptive folder and free sample. Get the facts about poultry feeds—decide *now, today* to join the thousands of poultry raisers who are saving money by buying their feeds direct from our mill. Mail the Coupon.

POTTER & CO., 10 Forest Ave., Downers Grove, Ill.

COCKERELS

From Our CROWN JEWELS

will prove gems in your breeding pens next season.

CONSISTENCY is indeed a jewel. Our birds have been *consistent* contest winners since contests began—306-Egg Keystone Maid, 304-Egg Lady Victory, 294-Egg Liberty Belle and numerous others.

Unquestioned leadership in our three great breeds has been maintained over eight successive years from these consistent winners. We can deliver immediately some fine

Early-Hatched Cockerels, pullets, yearling hens or breeding stock at special prices before birds go into winter quarters.

We are also booking orders from our **WORLD'S CHAMPION LAYERS** for delivery on specified dates next Spring, Hatching Eggs and Day-Old Chicks. Get your order in early.

Send for illustrated catalog "The Story of the 300-Egg Hen." Price 10 cents, deducted from first order.

PENNSYLVANIA POULTRY FARM
Box A LANCASTER, PA.

If You Are Wise You'll Use NEWTOWN BROODERS

Better Order Them Early

WITH the chick-growing season just a few weeks away, it's none too early to determine the equipment to which you will entrust your success for the season. If you choose Newtown Brooders you will have no regrets. And if you are playing the game safe you will place your order soon, the quicker the better, so the machines will be ready and waiting for that valued first hatch. Delay may make it necessary at the last moment to use some make-shift brooding equipment with consequent worry and loss to yourself. So order Newtowns—and order them soon.

Newtown Brooders are preferred by hard-headed, money-making, successful poultrymen who demand the best results. That's not sentiment—it's business! They use Newtowns because this great brooder "raises the most chicks, the best chicks, with least labor and at lowest cost." That's the true story—read it again!

The Newtown is the original colony brooder—coal-burning—self-feeding—self-regulating—fully ventilated—durable—easily managed—safe—portable—dependable—operates successfully in any suitable building. And it raises mighty fine chicks. Is that too good for you?

There's an oil-burning Newtown Colony Brooder, too. One that is Newtown quality all through and has made good.

Better write at once for our
Brooder Booklet. It's FREE.

Louisiana's Poultry Drive.

By Bentley B. Mackay.

When the student of geography reads about Louisiana he finds that among other things she leads in the production of cane, rice and other semi-tropical products. He will also read, in later editions, that the livestock industry is fast forging to the front. In no place is mention made of poultry, although any poultry fancier will say that the climate and other conditions for poultry raising in the state are unsurpassed. However, within a few years it is evident that this former laggard state will rank well up among the leaders in poultry work.

Harley L. Williams came to Louisiana Agricultural College at a time when chickens were not occupying the minds of anyone to any great extent. Cotton was selling at forty cents a pound, rice at fifteen dollars a barrel, cane at twenty dollars a ton. Why, then, should anyone bother with chickens?

Mr. Williams had a good subject, and he did not fail to get his message before the public. In every article he wrote, in every speech he made, he preached the gospel of pure-bred chickens. He warned the farm-

Harley L. Williams, Louisiana College of Agriculture, who put on the big purebred poultry drive.

ers that hard times possibly might be ahead. He tried to show that twenty-dollar cane and forty-cent cotton were abnormal; but they did not listen—that is, not at first.

"A Thousand Pens of Pure-Bred Chickens on Louisiana Farms!" howled Williams. "Impossible!" shouted all the county agents in unison.

But securing the promise of Director Perkins, and all of the extension workers of the college force to put over a poultry drive, Mr. Williams began preparing to make his drive a success. He got out a series of articles to every paper in the state; he furnished every county agent with hundreds of letters ready for their signature, to be sent to interested farmers. He then placed tentative quotas for every county agent in the state. A whole week in September, 1920, was devoted entirely to poultry by every extension worker in Louisiana.

The clouds began to disappear from the county agents' horizon; orders began to pour in.

Traveling all over the state, speaking to many people, soon told on Mr. Williams, but his mission was accomplished. He saw his drive go over the top. More people in the state talked and heard about pure-bred poultry than ever before.

To insure the people getting first-grade stuff when they purchased, Mr. Williams got the names of every reliable breeder in Louisiana and the names of breeders in other states, and then explained the purpose of the drive to them. If they were not willing to sell their poultry for a reasonable price, subject to his inspection, he took them off his list. In this way every person buying eggs or a pen of chickens through Mr. Williams or the county agent was sure of getting a good grade of stock.

"The Folks Who Know."

Prizes were offered to the county and home demonstration agents selling the largest number of pens of poultry.

B. W. Baker, Rapides County, sold 59 pens, winning the first prize of \$25. J. H. Cade and Miss Erin Dore, Arcadia County, 52 pens, second prize, \$15. Honorable mention: B. M. Jackson and Miss Fannie Buie, Ouachita, 44 pens; Miss Caroline Boudreaux, Lafayette, 28 pens.

The total number of pens sold prior to and during the week of the drive, which were eligible for competition, amounted to 518 pens. Number of pens sold after official close of drive, which, however, were a direct result of the drive, 576. Total number of pens sold, 1,095. The price paid for them was \$33,077, or an average of \$6.04 per bird. The above figures include sixty-seven pens sold by Mr. Williams personally during the drive, amounting to \$2,375, to parties in counties having no demonstration agent. The highest price paid for pens was in Desoto Parish, where some sold for \$150.

Of the total 1,085 pens sold, 31.1 per cent were Single Comb Rhode Island Reds, 27 per cent Plymouth Rocks (all varieties), 26.8 per cent Leghorns (all varieties), 6.5 per cent Wyandottes (all varieties), and the remaining 8.6 per cent included all varieties of Orpingtons, Minorcas, Anconas, Campines, Games, Buckeyes, Brahamas and Langshans.

The drive being hard to start seems harder to stop. "You sent someone up here to start your campaign," wrote a county agent, "now send someone to stop it. I have other work to do. I am a county agent, not a specialist in poultry."

With the close of 1920 came to deflation in prices. Cotton, sugar and rice planters have become bankrupt by hundreds. They who did not believe the predictions of Mr. Williams regarding poultry believe it now. They are learning that the one-crop system will not pay; it never has and never will. The results are that practically every farm is developing a nice flock of pure-bred chickens.

The money spent for pure-bred poultry and eggs in Louisiana from September 20 to March 1, 1921, is estimated by Mr. Williams to be \$80,000. The farmers have been shown that it pays to grow the best, and they went the limit for sound stock of pure-bred breeding.

Comment on Line-Breeding.

Much has been said and written during the past few months concerning line-breeding or inbreeding. Beginners are being told that they must adhere strictly to line-breeding if they hope to become successful poultry breeders. Those who are so strong in their advocacy of line-breeding seem to be under the impression that the only thing that is necessary for one to attain conspicuous success is for him to purchase a pen of fowls, being sure that all of them are from the same female and sired by the same male, and then continue to inbreed these birds. As I once before said, some degree of line-breeding is essential to success, but continued in and in breeding is likely to result in disaster.

If there were in the whole world a flock of fowls every individual of which possessed all of the qualities that one desires in his birds, and if it were never necessary to "renew" the blood of domestic fowls, the owner of that flock could go on inbreeding his birds forever, secure in the knowledge that he had reached a point beyond which none could go. But there is no such flock, and there never will be. And the necessity for occasional revitalizing our domestic fowls by the introduction of outside blood will always be present. These facts being absolute, out-breeding becomes as necessary a part of one's work as is inbreeding.

Advocates of intense inbreeding are assuming that this method of breeding does not lessen the vitality of the birds and are also assuming that our domestic fowls are perfect, which they

Better Grain Sprouter
For Less Money *Only* **\$1.75**
Freight Paid

**Get More Eggs This Winter—
Cut Down Your Feed Costs**

You can't get eggs in big quantities from your hens in winter unless you supply them with an abundance of green feed. A WISCONSIN Sectional GRAIN SPROUTER enables you to provide all the green stuff your fowls require at a very low cost. It will make three bushels of green feed from one bushel of oats, wheat or rye.

Look at these prices! Think of it, only \$11.75 for base, (complete with lamp) and one section with two trays—capacity 10 qts. of dry grain. This size will care for 50 hens and we ship it Freight Paid anywhere East of the Rockies. Larger machines are proportionately low priced. See price list below. Here's your opportunity to save money. This outfit will pay for itself over and over again this winter.

WISCONSIN Sectional Grain Sprouters

are made throughout of the best materials. They have a strong wooden frame, with heavy galvanized iron sides, lined with thick sheets of Nuroid roofing which is a great heat retainer and not affected by moisture. The strong grain trays are made of galvanized iron. Wisconsin cannot warp, shrink or swell. Large glass doors provide abundance of light to promote rapid sprouting. Lamp is absolutely safe so that sprouter can be used in basement, house or barn. Furnished in one, two, three, four or more sections. You can start with base and one section (50 hen size) and add other sections as your needs require.

See These Prices

MAHOOD'S S. C. R. I. REDS
THEY POINT THE WAY

Cockerels! Cockerels!

Magnificent, husky and with the blood of nine generations of Mahood's Chicago Coliseum winners at reasonable prices. Send for our fall sales list. Eggs from fall matings still half price during December at \$10, \$7.50, and \$5 per 15.

E. W. Mahood, Box 4, 616 Lee Ave., Webster Groves, Mo.

are not. Perfection in fowls is seen only in the wild state. Domestic fowls are a product of man, and, like all his products, possess many imperfections. Close inbreeding intensifies imperfections as well as any desirable qualities the birds may have.

Suppose a beginner has a flock of fowls in which there is a tendency toward a little too much length of leg, and he continues to inbreed his long-legged specimens, what will be the result? Each season will find more and more of the birds possessing the defect and it will be a matter of only a few years until every bird in the flock will look as if it is walking on stilts. And so it is with all other serious defects. What, then, is the proper procedure in this case?

The beginner should do what an experienced breeder would do: Purchase a bird that has the correct length of leg and infuse his blood into the flock. Inbreeding fowls that do not possess the characters which we desire to perpetuate is worse than useless. One must have some object in view other than the mere relationship of the birds when he makes up a mating, or he will never advance beyond the starting point.

Mo. John Miller.

Feed Grain Heavily in Fall.

One important factor in securing heavy winter egg production from pullets is to have the pullets thoroughly fat before they begin to lay. A pullet that begins laying before she has stored up a large reserve of fat cannot withstand the long strain of laying like one that has a larger supply of stored-up energy. In order to insure the pullets going into the winter laying season with liberal amounts of fat stored up to protect them against the cold and furnish the energy needed for egg making, particular attention ought to be paid during the fall months to the amount of grain in the ration. A practice now being followed by many successful flock owners is to begin reducing the proportion of mash and increasing the amount of grain in the ration about the time the pullets' combs begin to redden.

Instead of forcing the pullets into premature production by feeding excessive quantities of mash, it is now considered better practice to begin limiting the mash before the pullets are quite ready to lay and, through the use of larger proportions of grain, to get the birds thoroughly fat. The pullet that lays before she has reached proper size will lay an egg that is so small as to have but little market value, and keen students of the subject prefer to hold back early fall production by feeding a ration which will insure fat rather than stimulate egg production until the pullets have reached nearly full body development. It probably is not wise to entirely eliminate the mash containing meat scrap or tankage from the fall ration for pullets, but some of the people most successful in securing winter eggs from pullets claim that the fall ration may well contain four parts of grain to one part of mash and say that the pullets should be fed during the early fall months absolutely all the grain that they will consume. Then after the birds come into normal laying the proportion of mash should be gradually increased until by the 1st of January the mash makes up approximately one-third of the ration.

Hens also require liberal feeding of corn during the fall months if they are to be brought through the molt in good condition and be ready to start laying heavily as soon as the molt is finished. When a hen molts she is almost invariably in thin flesh and before she can lay prolifically her reserve supply of energy must be built up through fat just the same as with pullets. Molting hens need protein in the ration to insure the growth of feathers, so the meat scrap or tankage should not be eliminated from the mash but, as with pullets the amount of mash consumed during the molting time may well be somewhat reduced by feeding more liberally on corn and other fattening grain.—T. S. Townsley.

TOWNSLEY'S WORK IN MISSOURI.

T. S. Townsley, extension poultryman for the College of Agriculture of Missouri, has found that the most effective way to carry the poultry work of the State College to the people of the state, is to pick out a farm here and there that will adopt recommendations of the college and thereby become a local demonstration farm, demonstrating what results are possible when the recommendations of the college are adopted, and making plain to the local people just what those recommendations really are.

County agents are able to point to the local demonstration farm that is carrying out the methods of the college and at convenient times visitors are invited to inspect the equipment

T. S. Townsley, Extension Poultryman, Missouri College of Agriculture.

and stock on the demonstration farm. The owners of these specially selected farms keep records, which Mr. Townsley carefully analyzes for the purpose of making further suggestions for improvement. It is the biggest and most notable piece of poultry extension work that is being carried on in the United States.

In referring to his work, Mr. Townsley says:

If every hen in the state of Missouri laid as well as the hens on the farms where the Missouri plan of flock improvement is being followed, the present annual production of 115,000,000 dozen eggs could be secured from less than one-half the number of hens now kept. The average farm in Missouri keeps 94 fowls which lay annually an average of 55½ eggs per bird. In contrast to this low average, 112 Missouri farms where the Missouri plan of flock improvement is practiced reported in 1920 an average of 125 hens on each farm with an annual egg production of 114 eggs for each hen.

The Missouri plan of flock improvement is based upon the assurance that the conditions under which the farm flocks are handled will be improved on the average farm just as soon as the farmers themselves can be convinced that it will be profitable to change present methods. Poultry is a side line on Missouri farms, and the low average production for the state is primarily due to lack of attention to the problems of housing, feeding, breeding and general management.

That the poultry crop of the state is important enough to warrant attention to methods of increasing the efficiency of production is shown by the position which poultry and

EGGS!

But Not One Will Break!

If you ship a single dozen by mail or a carload by freight—eggs to eat or eggs to hatch—there is an Apco Egg Carrier that exactly meets your needs.

This carrier is new—a radical departure from any previous method of packing.

The Apco Egg Carrier

carries its fragile contents from farm to market *safely, absolutely without breakage*. It is a revelation to shippers. It also avoids injury to the delicate membrane of the eggs caused by constant vibration. The double-hammock construction of springy corrugated strips, holds each egg easily in its own compartment; avoids concussion at all points; absorbs every jar and jolt. Resilient corrugated walls form sides and ends of trays; and a tough, re-inforced, tear-proof fibre board case encloses all.

This Apco Egg Carrier goes any distance, by any route with absolute safety. Thoroughly tested and fully endorsed by leading poultrymen as well as by post-office, express and railway authorities. You can't crush an egg unless you crush the package—and you can't crush the package.

No trouble to pack—just as easy as the old-fashioned honey-comb filler. No wrapping of the eggs.

Don't order any egg carriers until you know all about the Apco—the most efficient and practical carrier ever made. Send at once for illustrated descriptive folder and prices. Try it yourself by any test you wish—it will make good. Write today.

AMERICAN PAPERWARE CORPORATION, Box 35, Columbia, Penna.

The Magic Brooder

The Wonder of Wonders

No person can ever realize the efficiency of this brooder until they try it.

Many people think "a brooder is a brooder" and one should be as good as another. A brooder that will not hold the fire nor maintain an even temperature will not do the work properly.

The Magic is built to do the work. It is equipped with both top and bottom draft regulation,

also coal magazine and gas escape system. The ash pans are made of galvanized steel and will not rust out. The deflectors are lock seamed and riveted. In fact, everything about the Magic brooder is quality from start to finish. They need attention only twice a day and will brood chicks at a profit. Without a reliable brooder it is impossible to succeed. Money refunded after thirty days' trial, including freight if the Magic brooder does not do all we claim. Send for free catalog describing same, together with plans for colony and laying houses.

UNITED BROODER CO., 348 Pennington Ave., Trenton, N. J.

STOPS PREVENTS ROUP

SID SMITH SAYS: Last year my O. D. Mitchell's Roup Germicide was used on high priced poultry at the big Chicago Coliseum and Stockyards Poultry Shows where it saved the lives of valuable prize winning birds. That's proof it ought to be good enough for you, isn't it? I want to prove to you that it's the very best **preventive and cure for Colds, Roup and Cholera** you ever used. Use it as a preventive and keep your flock well. No matter how bad your chicks may be, I positively guarantee a cure. When

eggs occupy in relation to other farm crops. The 1919 Missouri Crop Review issued by the State Board of Agriculture, shows the following values of the leading farm products: corn produced, \$214,469,000; dairy products, \$125,351,600; wheat produced, \$120,982,000; hogs sold and slaughtered, \$106,023,740; poultry and eggs, \$86,360,000; cattle sold and slaughtered, \$81,936,120.

From the standpoint of cash income poultry compares favorably with any other product. A large part of the corn is fed on the farm and a considerable share of the dairy products is consumed at home, so the cash receipts from the various items for the entire state probably rank in importance as follows: first, hogs; second, wheat; third, cattle; fourth, poultry and eggs.

Profits from farm poultry are, of course, quite closely associated with the number of

demonstrating the proper methods of feeding, housing and handling the farm flock to insure maximum production.

Mr. Townsley's recommendations, based on the poultry experiment work at the Missouri Agricultural College, under the directions of Professor H. L. Kempster, are as follows:

Missouri Plan of Feeding

Records from the Missouri demonstration flocks as well as experiment station data show that egg production is very definitely dependent upon the ration fed. No single improvement will show such immediate and such phenomenal results as will the introduction of proper feeding methods into the flock which has been indifferently fed. Poor feeding meth-

Visitors to the Demonstration Poultry Farm, many of whom had driven many miles, brought their lunch, and the event became a gala day.

eggs produced per hen, and available figures indicate that on farms where hens make a low average egg yield the flock is often kept at an actual loss.

About four-fifths of the feed a hen eats goes for body maintenance and the other fifth is used in egg production. The hen that lays a small number of eggs will eat nearly as much feed and cost almost as much to keep for a year as will the hen that lays twice or three times as many eggs. As a general rule the price of one egg is usually about the same as the cost of one pound of feed. The average hen will eat from sixty to eighty pounds of feed annually and must lay a similar number of eggs before there is much chance for her paying a profit to her owner.

Farm poultry keepers, therefore, will welcome the announcement that the present low average egg production can be very materially increased by proper attention to methods of feeding, housing, breeding and general management of the farm flock; for this increased production will bring greatly increased profits. Greater profits will be gained either directly by having more eggs to sell or indirectly by reducing the size of the flock and feed bill. This, then, is the purpose of the Extension Service of the Missouri College of Agriculture in fostering the Missouri plan of flock improvement.

This plan centers around the demonstration farm flock. Demonstration flocks are established on farms where the owners agree to co-operate with the county farm bureau and with the Agricultural Extension Service in

ods followed on a great many farms are the most important cause of the present low average egg production in the state.

In the Missouri plan of flock improvement, through the demonstration flock, special emphasis is laid on the feeding problem. Since the primary object in feeding hens is to secure egg production, a study of the composition of the egg ought to give some clew to the feed requirements of laying hens. Chemists state that the edible contents of the egg are made up of fat, protein and water. Water, of course, is easily supplied in abundance. The yolk of the egg is made up principally of fat, and the chief element found in the white of the egg after the water is extracted is protein. The egg shell is composed mainly of lime. Since the egg contains the three substances, fat, protein and lime, the natural assumption would be that a ration to make hens lay must also contain these materials.

Practical tests have shown that a shortage of either lime, fat or protein will limit the egg production.

As hens are commonly fed on the farm, the ration is rich in fat forming elements because all the grains which are commonly used in poultry feeds are primarily fattening foods. Most grains contain some lime but there is likely to be a shortage of this material unless it is supplied in outside mineral products such as oyster shell or soft limestone.

The principal defect in the usual farm flock ration is a shortage of protein producing elements. The common grains contain a small per cent of protein, but the hen, unlike most

HATCH EVERY GOOD EGG *with* SOFT HEAT

**Stronger Chicks
Less Expense
Less Trouble
More Money**

Tubeless. Full radiator plate does away with cumbersome, unsatisfactory tubes and pipes.

Smokeless, gasless, odorless. Nothing but pure, moist air reaches egg chamber.

Center Heat. No side lamp. Saves space and weight. Insures equal heating. Radiation from above, as hen supplies it.

Round Egg Chamber
—Just like hen's nest. Makes turning of eggs quick and easy.

Automatic Control
of moisture, heat and ventilation. Requires no attention. Steady, even supply assured, regardless of altitude or weather.

MRS. C. A. ASH, Litchfield, Mich., got 109 chicks from 109 good eggs the first time she ever used a **Porter SOFT-HEAT Incubator**. Roy Klavine, Geneseo, Ill., an inexperienced operator, got 100 perfect chicks from 100 fertile eggs. Mrs. C. A. Saunders, Center, Neb., got 176 strong chicks from 179 eggs, made over \$120 in 4 months, and had 150 chicks left which should make her \$150 more, or a profit of about \$60 a month. Hundreds of Soft-Heat users report 90% to 100% hatches, fewer losses and bigger profits.

Moist Warmth—A Life Saver. Moisture is necessary to life. Both eggs and chicks need it. The Porter supplies it automatically. Simple and certain. You can get big hatches and make easy money with

The Porter SOFT-HEAT Incubator

Duplicates Nature's process exactly. Turns every good egg into a strong, perfect chick. Principle endorsed by U. S. Government. Pronounced the greatest of incubator improvements.

No Suffocation—No Cripples. Eggs don't dry out in Soft-Heat. Moist warmth keeps shells brittle and membranes tender. Chicks break through easily and breathe pure, fresh air instead of poison-laden gases, from the very first. *The Porter hatches no cripples.*

Soft Heat Saves 300% in money, time and labor. 3 to 4 quarts of oil—one filling of tank—completes a hatch. Others burn 4 to 5 gallons and require daily filling of lamp.

Only 2 Minutes' Care Daily. Eggs are turned semi-automatically without removing or lifting tray, reducing necessary care to 2 or 3 minutes a day. A child can operate the Porter.

Make More Money This Year! Take your hatchling away from unreliable hens and dead air incubators. Get MORE and BETTER chicks, decrease your losses and increase your profits with the improved Soft-Heat. Use the most scientific incubator ever made. **WE PAY EXPRESS.**

Book Free! Fully illustrated. Explains Soft-Heat in detail. Gives interesting stories of success from many states. Tells how you can succeed and make money from the start with this BETTER hatcher. Send name today—a card will do—for your free copy.

other animals, appears to be unable to use protein from vegetable sources in growth or production. Investigators agree that hens are able to make egg protein efficiently only from protein of animal origin. Tests have shown that birds fed on vegetable protein such as cottonseed meal, linseed meal and gluten meal makes a very poor laying record, while birds fed the same sort of ration except with the addition of protein from an animal source, such as milk, commercial meat scrap or tankage, make high records as layers. These facts indicate that animal protein is an essential part of the ration if hens are to lay profitably, and the Missouri plan of flock improvement lays special emphasis on the supplying of animal protein in the ration as a necessary step to insure improvement in egg records. A ration for farm flocks ought to be as simple as possible and should make the fullest possible use of home grown products.

The Grains.

Corn.—Corn is the most important crop on most Missouri farms and, on the whole, is the best all-around grain for poultry feeding. Corn is rich in fat forming materials and supplies the nutrients needed for producing heat and energy required for body maintenance and also furnishes the elements needed in making egg yolk.

Wheat.—Wheat is next to corn as the best all-around grain for feeding poultry. It is highly palatable and contains fat forming materials and valuable mineral elements. It is easily digested and is not quite so fattening as corn. When the price is not prohibitive, wheat may well form a part of the farm poultry ration.

Oats.—This grain is, next to corn, the most common feed grain grown in Missouri and should form a part of the poultry ration on most farms. On account of the large per cent of crude fiber in oats, the amount of oats fed must be somewhat limited. Usually not more than one-third of the grain ration should be oats.

Kafir.—In sections where kafir and the other grain sorghums are important crops, the poultry ration may contain some of these grains. Kafir and similar grains are highly palatable with other grains and may be used same feeding value as corn.

Barley.—While not generally grown in Missouri, barley is often available at prices comparable with other grains and may be used as a substitute for oats.

Mash.

The animal protein needed in a ration is commonly fed in a mixture of ground grains or grain products and this mixture is called mash. The mash ingredients should be determined largely by the prices of the various materials available.

Bran.—Wheat bran is available in all sections of Missouri and, on account of its ash content and laxative effect, is valuable as a mash ingredient.

Shorts or Middlings.—Like bran, shorts or middlings are available from nearly every feed store or mill. As they contain a valuable part of the wheat nutrients and are usually cheaper than wheat, they are commonly included in poultry mashes.

Wheat Mixed Feed.—Some mills mix the bran and shorts and sell them under the name of wheat mixed feed or mill run. This has approximately the same feeding value as a mixture of bran and shorts.

Corn Meal.—Corn meal is usually more expensive than wheat by-products and on account of the danger of mold due to heating it is not commonly included in poultry mashes. However, where corn can be ground at home and fed as freshly ground corn meal, it can be used to advantage as part of the mash.

Ground Oats.—Unless the hull can be blown or screened out, ground oats will not prove satisfactory as a mash ingredient.

Animal Protein.

Milk.—Milk is the only animal protein commonly produced on the farm which is available in any quantities for poultry feeding. Milk is considered by many as the most valuable source of protein and should always be fed to poultry if available. Milk may be fed either sweet or sour with about equal results.

Meat Scraps.—This material is a by-product of soap making at packing plants and contains about 50 per cent of animal protein. The fowls find it palatable when mixed with mash, and it is highly successful in forcing egg production.

Tankage.—Tankage is made from condemned animals and other packing house waste. It is cooked at high temperatures to kill disease

germs, and all grease is removed for soap making. Tankage is slightly richer in protein than meat scrap but usually contains more indigestible material. Good grades of feeding tankage have approximately the same value for poultry as meat scrap.

The Ration.

The ration recommended by the University of Missouri College of Agriculture for demonstration farm flocks as being the most practicable for Missouri conditions is as follows: Grain—10 pounds of corn and 5 pounds of oats; mash—3 pounds bran, 3 pounds or shorts, and 1½ pounds commercial meat scrap or tankage. This ration contains the approximate amount of nutrient needed by 100 hens daily and is designed to furnish the materials needed for egg production at a minimum expense. Where milk is available on the farm, the meat scrap or tankage can be left out of the mash and the 100 hens be given three gallons of milk daily to drink. As indicated before, the animal protein is the most important part of the ration, and either milk, meat scrap or tankage must be fed in about the amount indicated if satisfactory egg production is to be secured.

The corn in the ration ought to be shelled and during the winter months should be scattered in straw litter eight or ten inches deep to insure the birds getting exercise. For hens in close confinement cracked corn probably has an advantage in furnishing exercise, but for hens under general farm conditions, the profit to be derived from feeding cracked corn is questionable. The heaviest feeding of corn should be given in the afternoon so that the birds may go to roost with their crops full. The oats in the ration should be fed dry and scattered in the litter the same as corn. Feeding the greater part of the oats in the morning stimulates the birds to scratch during the day.

Satisfactory substitution of any of the common farm grains can be made for the above mixture provided oats does not make up more than one-third by weight of the total grain ration.

The Missouri plan of feeding the mash is to keep it constantly before the birds in dry mash hoppers. To keep the ration balanced the hens should eat one pound of mash for each two pounds of grain. The amount of mash consumed can be accurately regulated by controlling the amount of grain fed. Where the birds are not eating the proper proportion of mash, a part of the grain ration should be withheld until the mash consumption becomes normal. Where too much mash is being eaten the condition can be remedied by feeding more grain. When meat scrap or tankage is used for a source of animal protein this material should be mixed thoroughly with the mash to prevent the hens picking out the larger pieces and wasting the mash. Feeding meat scraps or tankage alone does not give as good results as where they form a component part of the mash.

In using milk as a source of protein any shortage should be remedied by feeding enough meat scrap or tankage to correctly balance the deficiency. One pound of meat scrap or tankage has approximately the same protein content as two gallons of milk.

Missouri Plan of Housing.

The Missouri climate requires a type of poultry house which will furnish shelter for the birds during the winter storms and provide a reasonable cool roosting place during the hot summer months. The type of house which most nearly meets the conditions is the Missouri poultry house designed by the Poultry Department of the Missouri College of Agriculture. This is a gable-roof house with windows on all sides, open front ventilation and a straw loft which keeps the house cool in summer and warm in winter. Where new poultry houses are needed on demonstration farms, the Missouri type of house is always recommended. These houses have been built on many of the demonstration farms and have had a marked influence in improving poultry housing conditions in the various communities. As a result of the success of the house of this type on one Missouri demonstration farm, more than 40 similar houses have been built in the same community during the past four years.

The original plans for the Missouri poultry house call for a building 20 feet square designed to accommodate 125 to 150 hens. The plans are capable of enlargement to practically any size, and this plan is now being followed in building houses as large as 50 by 60 feet, providing room for 1,000 laying hens. On

It Takes Feed and Water to Produce a BIG EGG YIELD

Too many poultrymen think of feed alone, not realizing that water, which costs nothing, is equally as important as the costly grain. Laying hens must have water—a steady, clean supply at a comfortable temperature. Without it they cannot lay, and make losses instead of profits.

At the Missouri Poultry Experimental Station, it was proven by actual tests that fowls—any variety—fall off 50% in egg production when watered once a day as compared with those having water continuously. Think what it would mean to double the egg production of your flock with eggs at present prices! You can do this with less labor by using Norwich Automatic Air-Locking Fountains than by watering once a day.

Your birds will drink from four to ten times more water with the chill removed, and that means eggs! This wonderful Norwich Appliance provides a continuous supply of clean water with the chill removed at any temperature. It has been operated in Alaska at 60 degrees below zero! Safe—inexpensive to operate—positive in action—simple in construction—nothing to get out of order—a time, worry and labor saver.

Of course grain is necessary, and it's too valuable to waste or feed to mice, rats and sparrows. Put the scratch feed in Nor-

Secrets of
Expert Exhibitors
AND EASY LESSONS IN JUDGING
By FRANK HECK

Secrets of Expert Exhibitors And Easy Lessons in Judging

By FRANK HECK

THE time has gone by when a breeder can pick up birds right out of the yards and win with them without special preparation. This is true even in the smaller shows. There are always at least a few hustling, enterprising breeders in every locality who are keenly alive to the financial profit and the honors accruing from winning over all competitors. These breeders use all legitimate methods for putting their birds in show condition. Most interesting book ever published for breeders.

Faking and Legitimate Preparation Both Laid Bare

Faking is certainly wrong and it should not be practiced, but even in legitimate show preparation what chance have you to win over one or more honest competitors who may have a copy of this book and thereby possess the knowledge which enables them to fix up their birds in scores of ways that are not known to you. Consider also the immense advantage you would have in being able to detect such forms of faking as can be discovered in cases where there may possibly be a dishonest exhibitor in the class. You need this book to protect yourself against dishonesty.

All the methods, drugs, chemicals and various modes of preparing birds for the show room are fully explained.

You need the book to protect yourself against the dishonest faker and you need it to put yourself on an equal footing with your honest competitors. It will save you many dollars in useless entry fees, and it will show you how to win the coveted prizes and honors which your rivals would otherwise receive. Have you ever bought a poultry book on general topics or disclosing some system of so-called secrets, and upon receipt of it had your expectations drop with a dull thud of disappointment? Well, this is not that kind of a book! Don't put off sending your order. You need the book NOW. The price of the book is, including postage..... **\$2.00**

PEORIA, ILL.

many demonstration farms the houses already built have been remodeled into satisfactory buildings by providing ample windows for light, open air fronts for ventilation, dropping boards to keep the floor clean, and if necessary, a straw loft to make the house more comfortable. Under Missouri conditions a poultry house ought to furnish approximately 3 square feet of floor space for each hen kept. On many farms in order to accomplish this it is necessary to build more houses or else reduce the number of hens kept. In building or remodeling poultry houses the ideal of one square foot of windows to each fifteen square feet of floor space should be kept in mind, and the windows should be arranged on all sides of the building to give the maximum amount of light. The standard requirements for ventilation in Missouri poultry houses is that there should be 1 square foot of open front for each 10 square feet of floor space. The open front should be arranged on the south side of the building where the minimum amount of cold air will be admitted.

Dropping boards underneath the roosts are essential to keep the floor clean and give the hens the maximum use of floor space. To secure a practical arrangement of dropping boards, the Missouri plan of housing provides that the roosts shall be placed across the north side of the house at a height of about 36 inches from the floor with all roosts on the same level. The droppings platform is built directly beneath the roosts at a distance of about 30 inches from the floor and should extend a little past the edge of the roost in order to catch all droppings.

The Missouri plan of housing provides that the nests shall be placed under the front edge of the dropping boards, and that commodious dry mash hoppers shall be built against the walls of the house. This gives the maximum amount of available floor space for the hens to use in scratching.

Missouri Plan of Hatching.

Flock owners following the Missouri plan of hatching use incubators instead of hens for producing their chicks. Incubator hatching reduces labor, insures chicks at the proper season, and provides large flocks of the same age. Successful poultry raising in Missouri requires that the majority of the chicks be hatched during March and April. In order to insure this, incubators are a practical necessity. Demonstration flock owners are advised to buy the best incubators on the market as an incubator is a long-time investment, and the greater number of chicks hatched and the superior quality of chicks produced in the best machines much more than offset the difference in price between the cheap incubator and the thoroughly reliable one. A well ventilated basement is the proper place for running an incubator, but in case such quarters are not available the machine should be run in a room where the temperature is fairly uniform and where open air ventilation is constantly available.

TUBERCULOSIS OF POULTRY.

By H. D. Munroe.

Serious losses have resulted in the poultry industry of Pennsylvania, Wisconsin, Minnesota, Iowa, northern Illinois and northern Indiana from tuberculosis, in most cases without the owners knowing what had caused the trouble. Twenty-five per cent of the poultry in some sections of Minnesota is infected. This disease is chronic and infectious and is characterized by tubercles or nodules, found mostly on the digestive tract. In many cases it has been called spotted liver, liver trouble or rheumatism and affected birds described as "going light."

Tuberculosis exists in many species of birds. Among wild birds it is most destructive to those in confinement.

The worst feature of the disease is its manner of attack. It is difficult to combat because there are no visible symptoms until the disease is far advanced, and in the meantime the affected bird may be spreading the disease among others of the flock. The fact that medical treatment of tuberculosis in fowls is futile means that all measures for combating it must be of a preventive nature. The most thorough method of eradication is to slaughter the entire flock. Birds in good flesh, showing no lesions may be used for food. Those showing tubercles should be burned.

Houses, drinking fountains, and all fixtures should be cleaned and disinfected thoroughly with a strong solution of carbolic acid, creosol, bichloride of mercury or formaldehyde. Carbolic acid may be used in 5 per cent solution, creosol in 3 per cent solution. Bichloride of

mercury part formalin to 10 parts of water. Quicklime is a good disinfectant for the yards. The liquid should be sprayed so that everything is well soaked. After the disinfection the houses should be kept empty for several months so that any germs not reached by the disinfectant will be killed by the sunlight.

Tuberculosis in fowls may be introduced on a farm or poultry plant in several ways. Among these are the addition to the flock of birds from an infected flock, exposure to a neighboring infected flock, infection of the premises by birds, rats and mice, and carried by man and animals, whose shoes or feet may carry infected droppings from a nearby farm.

The extent to which affected birds may scatter the infection depends upon the stage the lesions have reached in individuals. The outlet for the organism is principally through the intestinal canal by means of droppings. The older birds, which have harbored tuberculosis for months, give off infection to the greatest degree and are the most dangerous.

Although the birds may become infected at any age, the disease is not generally detected in those less than one year old. It is those from two to three year old which are most likely to display noticeable symptoms and show a high death rate.

One of the first symptoms is gradual emaciation, which is most noticeable in the breast muscles. These diminish in size until in advance cases there is scarcely any flesh left on the breast bone. The appetite remains good. Lameness in one or both legs or drooping of one or both wings is often observed. These results from the development in joints of the wings or legs of tubercles which cause a swelling. These swellings may break down and discharge a cheesy material.

As the disease advances the comb, wattles, skin of the head and membranes in the mouth and about the eyes become pale. The eyes remain bright. The feathers are often ruffled. The bird grows listless, weak, moves about little, and is easily caught. Diarrhea often accompanies the advanced stages.

Upon post mortem examination the liver and intestines are often covered with numerous raised nodules varying in size from a pin head to a pea. Still more conclusive evidence is found if the spleen is covered with these nodules. The lungs are rarely affected by the infection spreading from the liver on to the lung tissue.

Unhampered Distribution of Standard Necessary.

(Reprinted from Inland Poultry Journal.)

How perfectly absurd it seems to a person of average intelligence that the American Poultry Association, that organization, heralded as the largest live stock association in the world, having as its prime object to interest the greatest possible number of people in the breeding of standardbred poultry, should stand in the road of poultry progress all these forty odd years it has been in existence.

It begins to look as though in time the ice might be broken, if some of the old-timers who have controlled the affairs of the association practically all these years don't get stubborn and use their chilly influence in freezing it up again.

There is a wave moving for a free unhampered distribution of the knowledge of the requirements of the various breeds and varieties of standardbred poultry as now contained in the "American Standard of Perfection," a copyright book owned and published by the American Poultry Association.

In the name of all reason why should the American Poultry Association, having as its object to increase interest in the breeding of standardbred poultry, defeat that object by refusing to convey the knowledge of what is required to make up the perfect specimen of the breeds without being paid for the same? Frankly speaking, to big, broad minded men in other lines of endeavor it looks like a cheap holdup game and many have so stated and cited the fact that when they want any similar information regarding the requirements of cattle, hogs, sheep, pigeons, even dogs and cats, they can secure such information from the associations which represent them, free of charge, together with other interesting literature giving the merits and possibilities in the breeding of the same.

If we are to make the progress the poultry industry is justly entitled to, we must get away from these obsolete ideas, we must break the fetters which have hindered advancement, and spread the knowledge of the requirements of the Standardbred hen to all the world. Every specialty club and every breeder should have this information to send out when ever requested.

We can't afford to travel by stage coach and let other live stock industries use the air. —Fred W. Hallet.

So Easy to Use

ALL successful poultry raisers know that next to a proper supply of feed and water the most important thing in poultry raising is to keep the houses clean, and the birds free from lice and mites. *It is always important but especially so in hot weather.* Sickness or disease usually starts in unclean quarters and in such quarters lice and mites are always more plentiful. Thousands of poultrymen do their whitewashing and disinfecting in one operation by using

The Disinfectant That Dries White

Carbola is a white paint in powder form combined with a disinfectant many times stronger than pure carbolic acid. It is harmless to the smallest chick, and is ready to use the minute it is mixed with water—no waiting or straining. It can be applied with a brush or a spray pump—it will not clog the sprayer—and does not blister, flake or peel off. One gallon—a pound of the powder—covers 200 square feet. It does not spoil, even after it is mixed, and has no disagreeable odor.

As a Louse Powder

Carbola gives most satisfactory results and costs about one-third as much as the other brands. It should be used just the same as any other louse powder is used. Dust it well into the feathers, working the powder in with the fingers, especially under the wings and around the vent to make sure it reaches the skin.

Give Carbola a trial instead of whitewash and disinfectants in your poultry houses, cow barn, stable, cellar, warehouse or outbuilding. It will save you time and labor, will turn a disagreeable job into pleasant, agreeable work—make it easier to do work that must be done. Get some today and have it on hand when you want it. Money back if not satisfied.

Your Hardware, Feed, Drug or Paint Dealer has Carbola or can get it. If not, order direct

Brood Your Chicks 30 Days FREE!

**1,500 Chicks
around one stove**

Also small size stoves.
No hovers to bother
about. No gas, no
fumes, no wicks, no
smoke. All bother
and worry gone.
Losses reduced to a
minimum.

Use this wonderful new Simplex Brooder Stove in your own brooder house 30 days absolutely free. Write for free Brooder Book fully explaining offer. Try the stove under all conditions. Make any test you know of. Then, at the end of 30 days, if you are not delighted send it back and we'll cheerfully refund your money. You alone are the judge.

Turns Losses to Profits

This wonderful new brooder will raise 50 per cent more of your chicks than you have been able to raise by old-fashioned methods. No more deaths from white diarrhoea and poor ventilation. It turns the losses from dead chicks into big profits for you. The Simplex soon pays for itself by extra money it makes.

Saves Labor and Expense The Simplex Brooder Stove means one-tenth as much work—costs one-fourth as much to operate as any other system. It is self-regulating—needs no watching—eliminates all worry. Try it 30 days free.

Send for Free Brooder Book

Send today for valuable book that tells how to "Increase your Profits by Decreasing Mortality"—absolutely free. It tells how to solve your brooding problems. It tells how to save the chicks that you have been content to lose every year through disease and faulty brooding—how to make twice as much money from your poultry. Also catalogue and complete details of the wonderful Simplex Brooder Stove and our 30-day free trial offer. Sent to you absolutely free. Send today.

LAYING PULLETS IN DECEMBER.

By C. F. Stem.

We all want Winter eggs, and especially do we desire them during December. Eggs produced now generally sell for twice as much as Spring and Summer eggs.

Hens that molt during the late Fall cannot be depended upon for early Winter layers, so we must look to the pullets for our supply when eggs are the highest. Pullets that were hatched any time from March 15 to May 15, and were given proper care, fed carefully and kept growing well throughout the Summer, should arrive at the laying stage about October 1 to November 1. If hatched earlier than March 15, they will begin laying early in the Fall and will lay for a while then molt, and will be no better than a two-year-old hen, as far as early Winter laying is concerned.

The heavier breeds, such as Reds, Rocks and Wyandottes that take from one month to six weeks longer to develop into layers, are best if hatched during the period from March 15 to April 15, while the Leghorns and other lighter breeds that develop more rapidly give better success if hatched any time from April 1 to May 15. This method of hatching is intended for those who wish eggs during the months of November and December when eggs reach the highest price. The older hens generally stop laying about October to begin the molt, and by having the pullets laying at this season you are assured of an egg supply the year around. A sort of an "endless chain."

Where only a few pullets are kept, and the eggs used solely for home consumption, hatching at any time during the Summer will be satisfactory. Many people prefer to hatch and rear their chicks after the warm days of Summer have arrived. For these people June is the ideal month, and, as a rule, the chicks grow fast, and seem to thrive nicely, not suffering the set backs that some time happen with the earlier hatched birds that have passed through the cold, damp days of Spring.

Many of the prominent poultry show men of this country prefer chicks hatched in June and July as they come into full bloom at just the right time to make a fine appearance at the big Winter shows during December and January.

Late hatched pullets, as a rule, come into laying some time in January and February, and always give a good egg yield during the Spring and Summer. I have hatched White Leghorn pullets as late as August 5 and on January 9 they were giving a 50 per cent egg yield, and increased from then on and laid extra well throughout the Spring and Summer; in fact, right up to late in the Fall when they molted.

A great many things must be taken into consideration from the time the pullet is hatched until it enters the laying house in the Fall to become a full-fledged laying pullet. The foundation for a great layer can be fed into a pullet from the time she is a downy, new hatched chick to the time she is hunting a nest in which to deposit her eggs.

Feeding for Eggs.

It is just as important that the pullets be fed right during the period of growth as it is that they be fed an egg producing ration after they reach maturity, and there is where the hopper fed pullets have the advantage. They eat just what they want and mature uniformly. Of course, there is a difference in pullets, but why some pullets of the same breed, strain and hatch require six to eight months before coming to laying, while others will reach this stage in five months, seems to indicate something more than mere individual difference.

Uniform development is a most desirable trait. It is a satisfaction to know when you take off a hatch just when you can depend on receiving eggs from the pullets in that hatch. I think hopper feeding has helped us to solve the problem of uniform maturity. Having the hoppers where they can visit them often enables them to get just the amount and kind of feed required and assures rapid development. That has always been one argument against large flocks of chicks and hens—We could not feed them in such a way that they would all get their share; therefore, there would be a large number of stunted chicks and poor laying hens if we kept a large number together. Hopper feeding has solved this problem.

Observation teaches us that hopper feeding is the one safe, sane and conservative method of rearing chicks and handling laying pullets. A good dry mash in a hopper will compensate for what the birds fail to get in the litter. You can grow better chicks because there will be none over or under fed. All have an equal chance and get just what they require. A moist mash is argued by some poultry men as being more beneficial than the dry. This may give satisfaction with small flocks, and no doubt hastens laying if fed about the time the pullets are reaching maturity. With large flocks a moist mash is out of the question. Try feeding five hundred pullets in one flock a moist mash. If we attempt to feed this number a moist mash from a trough, there will be such a mobbing that not half of them will get what they require, no matter how careful the feeder may be or how large the quantity of feed. Success with large flocks means dry mash feeding in hoppers. We can scatter grain enough in the litter to give them exercise.

The following scratch grains have given satisfactory results:

2 parts wheat, 2 parts cracked corn, 1 part good, heavy oats. This should be fed morning and evening in the litter, and the following mash should be placed in the hoppers where they can get what they want when they come in off the range.

1½ parts wheat bran, 1½ parts ground oats, 1 part corn meal, ⅓ part linseed meal, ¼ part alfalfa meal, ⅓ part beef scrap, ½ pound of salt to each 100 pounds of mash. If buttermilk is provided, the beef scrap may be omitted until the pullets are placed in the laying house.

Many failures in getting Winter eggs are due to lack of sufficient water, especially during the Winter time when the poultry is confined in the laying house. When we consider that from 70 to 80 per cent of the composi-

If You Keep Hens CUT THIS OUT

1,000 Eggs In Every Hen—Four to Seven Eggs a Week per Hen
Through Cold Winter Season. With Eggs at Dollar a Dozen
Means \$5.00 Profit per Hen in Next Six Months. Amazing
Poultry Secrets Revealed by

AMERICA'S FOREMOST POULTRY EXPERT

This is an offer no reader of this paper who keeps chickens can afford to ignore. We will tell you why.

Henry Trafford, Famous Poultry Expert and Breeder, for nearly eighteen years Editor of "Poultry Success," has developed a new and remarkable system of rearing, breeding and feeding chickens for heavy egg production that seems certain to revolutionize the poultry industry and give five eggs or more for every egg produced today. This plan or system is explained in Mr. Trafford's "1,000 Egg Hen" a free copy of which will be sent to any person who keeps six hens or more.

Poultry keepers, following Mr. Trafford's directions, learn how to start young pullets laying early; make old hens molt quickly and resume heavy laying during entire winter season. Most any hen will lay in spring when eggs are cheap. Mr. Trafford tells how hens lay four to seven eggs a week during coldest winter days when eggs sell at a dollar a dozen or more. His system shows how any breeder, with ordinary care, may get 1,000 eggs or more from nearly every hen in four years' time at a net profit of \$25.00.

There is big money to be made with chickens this winter by the man or woman who

gets the eggs. The time to get the hens ready for heavy winter laying is now. Mr. Trafford's "1,000 Egg Hen" system tells how and arrangements have been made whereby any reader of this paper may receive one copy absolutely free by using the Coupon below. Send no money, but cut out the Coupon and mail it with your name and address to Henry Trafford, 860 E. Court Bldg., Binghamton, N. Y., and the story of the 1,000 Egg Hen will be sent you by return mail.

Chicago, Ill., American Poultry Journal

"DANDY" BONE CUTTER

You needn't pay one penny for this bone cutter until you try it and it satisfies you. Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy Green Bone Cutter cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood, feathers. Our terms on the Dandy Bone Cutter are:

No Money In Advance—15 Days Free Trial

The Dandy costs less than most bone cutters and it works infinitely better. Also cuts meat, vegetables, roots, etc. To ensure big sales this year we have made special reduction in prices. Write quickly for free booklet. Prices are liable to rise next month, owing to big demand for raw material. STRATTON MFG. CO., Dept. G, ERIE, PA.

HAVE YOU EVER BEEN OFFERED ANYTHING LIKE THIS BEFORE?

20 Bags (One Ton) of the best balanced Food obtainable for poultry and hogs. Shipped prepaid in new bags

MOTT'S FEEDING TANKAGE cannot be excelled for producing eggs and fattening and building up chickens. It is a tankage containing meats, wheat, corn, rye, oats, potatoes, dairy products and all other vegetables. The tankage is produced by being put in tanks and concentrated, steam cooked and the process is so conducted that at no time does the temperature exceed 200 degrees Fahrenheit. Thus we prevent the destruction of the food value of the contents. The result is a product containing all the original food values in the concentrated, sterile and absolutely pure form; being the best balanced feed obtainable at any price.

We make dealers attractive proposition on quantity orders.

H.E. MOTTS CO., 603 Superior Ave. N.W., Cleveland, Ohio.

42 PIECE SET FULL SIZE GOLD MEDAL DISHES

If you live in the Middle or Eastern States, in order to have you as one of our many satisfied and permanent customers, if you will send us your check or money order for \$38.00 we will ship you a full ton, of our MOTT'S FEEDING TANKAGE in twenty 100 lb. (net weight) new bags—delivered to your station, *freight prepaid* and one complete 42-piece set of our Gold Medal Gold Band Chinaware and also *prepay the expressage* to your home. Unless we had all the confidence in the world in our tankage we could not afford to offer you the above exceptional, once in a life time proposition.

Bank References, The Guardian Savings & Trust Co., Cleveland, O.

tion of eggs is water, the importance of keeping a fresh, clean drink constantly before the layers is very evident. Grit, oyster shell and charcoal should also be placed where the pullets will have free access to them.

Any cockerels which you do not wish to keep over for breeders should now be placed in a house and fed three times a day a mixture of corn meal and wheat shorts, to which has been added a sufficient amount of buttermilk to make the mash crumbly, also give them all the buttermilk they care to drink. You can fatten cockerels for market in a very short time by this method. You will then have them off your hands and can devote more of your time and feed to the pullets. Pullets are very timid, and if the cockerels are allowed to run with them they will not develop as rapidly and will not reach the laying period as early as they would had they been separated.

Exercise Brings Good Health.

Promote exercises by feeding the scratch grains in a clean, deep dry litter. Oats or wheat straw makes excellent litter and plenty should be provided for all the layers. Straw that becomes damp should be changed. If the fowls are fed on the bare ground they will pick up the feed without any effort and rest until the next meal comes along. Exercise increases the circulation of the blood in the body of the bird. This means that all parts of the body will be properly nourished and that the strength and vigor of the fowl will be built up and maintained. Exercise is one of the most powerful natural enemies of disease.

How to make good Winter layers can be summed up in brief—by constant care, the right kind of feed, both mash and scratch grain; regular and proper feeding; good pure drinking water and plenty of it; plenty of buttermilk; good, clean, well ventilated hen houses, with plenty of room for each and every hen; scratching pens and green feed and grit; a few ounces of preventatives, a good laying kind of purebred fowls and a good laying strain of that kind. "Make up your mind what breed is best suited for the purpose you want, and stick to it." When eggs are high you want pullets to lay. Make them scratch for every grain you feed. Replenish the litter frequently and your fowls will repay your efforts with well filled egg baskets. Remember that the price of success with poultry is unremitting diligence in attention to details.

CARRY EGGS SAFELY The Keipper Way

Fertility and hatching qualities of millions of eggs are damaged yearly by careless methods of shipping. Think of it. Why not save the fertility and insure satisfactory hatches for your customer by using Keipper Non-Shock Egg Carriers? Each egg held in place by rubber bands which prevent vibration in transit, ruptured tissues and injury to fertility.

You Can Safely Guarantee Eggs Delivered in These Carriers

Boxes shipped all assembled ready for use. Strong outer box can be used repeatedly

Chicago Entry Breaks Records.

The entry at the Coliseum poultry show, which is to be held in Chicago early in December, not only exceeds the total entry of last year, but is more than 500 ahead of the record year of 1912. For the first time the annex to the Coliseum will have to be used.

Barred Rocks are a big entry. There are 68 exhibition cockerels, and 40 cockerel-bred pullets. There are 15 cockerel-bred pens, but only 2 exhibition pens. When more than 20 entries are made in a class 7 prizes will be awarded. This applies to the whole show.

About 100 White Wyandottes. Partridges usual strength. The same good entry of Bufrs. Silvers are a better class than the show has been having, with Sampson in from New York, and Rublee from Massachusetts.

The entry of Reds is not up to previous high marks, and will be one of the surprises of the show. Only 69 Rose Comb Reds, which is the smallest entry in years. There are 165 S. C. Reds. The R. C. Whites outnumber the S. C. Whites. Buff Orpingtons are one of the largest classes of the show, and give promise of being one of the greatest classes ever brought together in America. Byers is showing. Conway of Mayslake Farm, fresh with the flush of victory at Syracuse, is in. Hobbs of Campbell Soup Farm, N. J., has been laying low ever since the Garden last year, with his eye on Chicago, and he is coming to Chicago to give battle to the west. Wyant Bros. of Indiana and Tipplehorn of Ohio are also showing. The entry of Black Orpingtons is weak: we understand there are 4 exhibitors, and all told not over 8 or 10 birds.

Leghorns will be one of the greatest shows ever seen. There are 213 S. C. Buff Leghorns, including 39 cockerels. Close to 200 S. C. White Leghorns, with Hillview, Rogers, Warren, Ferris and others showing. Nearly 60 R. C. White Leghorns. About 175 S. C. Brown Leghorns. A rattling good entry of R. C. Browns. Four exhibitors in Blacks and some Silvers.

Minorcas are headed by 76 specimens of the Buff variety. Remarkable how this variety is coming forward. About 64 Black Minorcas, shown by three or four exhibitors. Some 40 S. C. White Minorcas, which shows the way this variety is securing strength.

About 30 Sussex, all Speckled. A good entry of Light Brahmas. F. J. Nutter of Maine is showing. M. S. Barker is back in Langshans, and the entry is good. Anconas, over 100 birds. Andalusians, probably larger than last year. Silver Campines, three competitors. Battles of Ohio alone shows Golden Campines.

Largest Bantam entry since the club meeting at the Coliseum. Black Breasted Red Game Bantams total 60 birds. There are also 10 Exhibition Black Breasted Red Games, something that has not been seen at a western winter show in years. An unusually heavy entry of Ducks, Geese and Turkeys, with the Rouen, Toulouse and Bronze varieties leading.

No Polish or Houdans. Although a special judge assigned to the crested varieties, not a single bird is entered. About 30 birds in the utility class, all females.

A number of entries, we understand, were returned because of late receipt. The awards will be awaited with interest, for so large and important a show was never cooped in Chicago.

Milwaukee Holds Good Show.

Those who have been attending the Milwaukee show for years pronounced the event staged Thanksgiving week as the best poultry exhibition ever cooped in that city.

The national meeting of the White Leghorn Club was held at this show, and a large entry of the variety was put down. Dr. Cohn of Milwaukee was a large winner, but both his cockerels and pullets were young. Oak Dale Farm exhibited and they put down a line of birds that had magnificent bone and substance, but their birds lacked condition. Some specimens of ordinary quality were shown in this class, and it looked as if the strength of western breeders was being held back for Chicago.

Buff Leghorns were a fine aggregation. Some of the cockerels need more bone and length of body, but the class as a whole was uniform in color, and it becomes apparent that this variety is rapidly coming to the front. In Mediterraneanans, the Black Minorcas, Buff Minorcas, Blue Andalusians and Anconas also commanded attention. There were some very attractive White Orpingtons, lacking neither in bone, feather or type. Buff Orpingtons were also out in strength. Black Langshans were not only of high quality but there were a number of them. The uniformity of B. Langshans, together with their beauty and utility qualities makes one wonder why so pure and dependable a breed is not more fully appreciated everywhere.

White Rocks formed good classes. Quality in Barred Rocks was not so uniform, the 1st exhibition pen being inferior to either the

HANSEN'S RUSSIAN ORLOFFS

UNDISPUTED CHAMPIONS OF AMERICA. Won all blue ribbons at the Coliseum and Madison Square Garden, 1921. World's greatest cold climate fowl. Booking orders for Fall delivery of stock. Send for circular. DR. M. A. HANSEN, Importer and breeder, Osage, Ia.

ARTIFICIAL LIGHT

Hens Lay Best in the Spring When the Days and Nights Are of Equal Length. Illumination Means a 12 to 14 Hour Work Day During the Winter When Eggs Are High in Price.

\$21.60 Per Month Increase from 25 Hens

A pen of 25 S. C. W. Leghorns responded to the artificial lights within ten days. They were started November 13, 1920, laying only 5 eggs that day. On November 25, they produced 18 eggs and kept going at that pace all winter. Figuring the eggs worth six cents each, means \$21.60 added production for one month.

A Portable Three Hundred-Candle-Power Light which burns 12 hours at one filling—costing less than one-half cent per hour for light that in brilliance, whiteness and steadiness puts any electric incandescent light in the shade. It burns common gasoline or kerosene. Is storm-proof, bug, rain, sleet and snow-proof. You can upset it and roll it around without the slightest danger. No odor, no smoke, no wicks to trim.

During the short days of winter it keeps your hens busy to eat enough to last them through the long, cold night—they have nothing left for eggs. Keep one of these lanterns burning in your poultry house early in the morning, and for a while in the evening, and see your egg production jump. Equipped with special reflector top—that throws all the light down, and there is an equal distribution of light because there is no tin door on the mica chimney.

Equipped with automatic tip cleaner which prevents clogging of dust from the bowls scratching. Fitted with special device that enables you to adjust the light to high, low or turn it out instantly, just the same as you would turn any other light up or down. Send for Circular.

winning cockerel-bred or pullet-bred pens. Rhode Island Reds formed strong classes. R. C. Rhode Island Whites outnumbered the S. C. It is so easy to put a R. C. on a variety, the first cross doing the trick, and while this breed is in a formative state, those who own S. C. Whites might get a R. C. male and impose the rose comb character on their flocks. There is continued talk of W. Rocks walking off with the prizes in the S. C. R. I. White class.

In Wyandottes, the first young pen of Silver Laced was very fine. The show was attractively cooped. One point worthy of special mention was the good light. The coops were clean, and the show hall was the freshest and cleanest smelling poultry show room we have ever been in. While the Auditorium was warm, the air was fresh, and the birds looked splendid. Lack of ventilation destroys the bloom and condition of many a show-room full of chickens. Chickens require a great deal of air, a point that too many show managements overlook. At Milwaukee two large drive fans were continually renewing the air in the show room.

Secretary Marvin and his associates deserve to be congratulated on the fine show that they have held. Such an exhibition is a credit to the entire State of Wisconsin, which, we are told, has a larger hen population, according to the 1920 census, than New York State. The Keipper company, which cooped the show, have a pretty close check on the entries, and Mr. Keipper put the total number of birds at close to 2,000. The show as a whole showed good breeding throughout, and the birds spoke eloquently of the fine stock being raised in Wisconsin.

Big Kansas City Entry

As this issue goes to press, Secretary Quisenberry telegraphs that the Heart of America has 4,000 entries. This evidently includes pens and indicates something like 5,000 specimens.

This is 100 per cent increase over last year's show. Mr. Quisenberry's telegram adds: "Well balanced show—great interest—largest turkey show ever held."

WHITE PLUMAGE AND YELLOW LEGS.

By Fred W. Smith.

Editor American Poultry Journal:

I read your write-up of the New York State Fair poultry department, with much interest, especially the portion in which you mention the leg color of our American varieties, which I take to include the Leghorns.

Now in some respects, I wish to differ with you. I feel that from now on, American fanciers should, and in a way, must pay more attention to production values. The Leghorn, although one of our best fancy breeds is to most people an egg producer, and that is the way it should be taken. There is no other breed that will produce a dozen eggs on the same amount of feed.

The Leghorn pullet with the brightest yellow beak and shanks, will start to fade them with her first dozen eggs and before she has laid one hundred and fifty (150) eggs, they will be nearly pure white. I do not think this is a sign of extreme high production, but I do think that it is impossible to get the highest production without the fading. If a hen takes but a short rest at molting time, she will some times start laying without regaining much of this color.

The Leghorn seems to lose this color much more easily than do the American breeds, but very often the heavy producing Rocks or Wyandottes have pure white shanks at the end of the laying period.

If a yellow beak and shank was to be rightly enforced it would, in my opinion, nearly eliminate the fanciers trying to combine egg production with exhibition points.

The foregoing does not in any way apply to the males. If we will carefully enforce the color requirements with the

males I feel that would be sufficient to safeguard this very valuable breed characteristic.

I consider the Standard to be inconsistent in regard to bright yellow beak and shanks and pure white ear lobes in Leghorn males. I have never been able to produce all of these on one male bird. I have had males with pure white ear lobes, but they did not have what I call good leg and beak color and I never knew one of these to breed a fair percentage of good birds.

I do not think that a creamy lobe looks out of place on a Leghorn male and would suggest that the Standard be made to read white or creamy white.

These are convictions gleaned from my experience and I hope they meet with your approval.

PARTRIDGE WYANDOTTES

By Chas. E. Kraner.

Few breeds of fowls can compare with the Partridge Wyandotte as an all-around fowl, and only those who have bred them for any length of time know their value as such. Much has been said of them as a table fowl, which value is surpassed by no other breed, their meat being very tender and juicy, even at an old age, on account of the make-up of the breed. As to their laying qualities they rank with the best. Of course there are strains or certain individuals that lay more than others, as is the case in all breeds; but there are some strains that have been trapnested for a number of years which are wonderful layers, laying most of their eggs in winter, when eggs are scarce and high priced.

The writer had a number of yearling hens (not pullets) that began laying last fall and all through the winter until late in the breeding season

before becoming broody. One pen of six hens in the latter part of May, after laying all winter, laid 39 eggs in seven days, out of a possible chance of 42.

"Moorish Maid," a yearling hen (the mother of Highland Maid, the wonderful pullet that won the grand sweepstakes prize at the Ohio State Fair this year, and pronounced by many to be the best Partridge Wyandotte pullet ever seen) has been a most wonderful layer of very large eggs. She began to lay a year ago last August, not finishing her molt, laying through the winter and all through the breeding season, until the latter part of September of this year before she went broody. Then after three weeks' rest she started laying, and is laying now.

As to beauty, the Partridge Wyandottes excell, if well bred; but the question is often asked: "How should they be mated to produce high-class birds that retain their beauty?"

We admit it is no easy task to breed high-class birds of both sexes from a single mating, which mode of mating is proper. The writer has bred Partridge color and penciling for over 40 years. Long before the Partridge Wyandottes were thought of we were breeding the Partridge Cochins. At that time the penciling and color were not nearly as good as we have it on our Partridge Wyandottes today. Writers at that time advocated extreme matings, that is light males and dark females, or the opposite. Among them was Lewis Wright, an English writer, who advocated that to produce good pullets mate a light cock with dark hens, or to produce good cockerels, use a dark male and light females. That was double mating and did not help the penciling any, as witness back in

the seventies when the penciling was not nearly as good as ten years later.

The writer has a collection of feathers taken from the best specimens from time to time, both of Partridge Cochins and later Partridge Wyandottes.

Some years after the Partridge Wyandottes were admitted to the Standard, many of the breeders began breeding the males so dark that they were nearly black, and while they had as a whole good color in their females, they were in danger of getting them too dark also. Then the craze came for the other extreme; that is, light birds, which did more injury to the breed than the extreme dark ones, and from which many breeders are suffering yet; but the old experienced breeders were careful not to go to the extreme and profited thereby.

If we study nature and thoughtfully look into the bird kingdom what do we see? We see that the males are of bright colors, while the females are of a dull color; but with our Partridge Wyandottes we want to retain the beauty in the female also. Now then, if we cater to the brighter color in the males, we will lose color in the females, and to overcome this, we must have the color in the male that we desire to have in his pullets. We cannot expect to breed a cock with a bright orange colored hackle and saddle and expect mahogany colored pullets. Although he may produce some good ones, providing he has darker blood back of him. To continue such mating is to weaken your color lines on the female side. That is why many breeders who have no trouble getting good, bright colored males have trouble with their females. Many of these breeders have been good customers of

The American Breeds of Poultry By Frank L. Platt

Every
Amer-
ican
Breeder
Needs
This
Book

This new book, published 1921. Up-to-date in all particulars. 256 pages. 100 illustrations. Printed on enameled paper. Bound in brown cloth. The most elaborate and costly book we have ever published.

This is the only exclusive work ever offered to the public on the great dual-purpose breeds that have been made in America by the genius of American breeders. An entirely new text, in which the author goes back to original sources, and starting at the beginning writes a history of the American breeds, tells of their origin and traces each step in their development. Every detail on the proper mating of each variety is given in a plain, practical way.

M. L. Chapman, manager of the great Wilbartha Poultry Farm, writes: "I think this book is away ahead of any similar work I ever read and intensely interesting. If I could have had some such similar book twenty-five years ago, I would have been winning at the Madison Square Garden Show a great many years earlier."

All you want to know about Barred Plymouth Rocks, White Plymouth Rocks, Buff Plymouth Rocks, Partridge Plymouth Rocks, Silver Penciled Plymouth Rocks, Columbian Plymouth Rocks, Blue Plymouth Rocks, Black Javas, Mottled Javas, Black Giants, Buckeyes, Missouri Fluffs, Silver Wyandottes, Golden Wyandottes, White Wyandottes, Buff Wyandottes, Black Wyandottes, Partridge Wyandottes, Silver Penciled Wyandottes, Columbian Wyandottes, S. C. Rhode Island Reds, R. C. Rhode Island Reds, Rhode Island Whites, Dominiques. Full details on breeding for meat and eggs as well as all Standard points.

Only a few of the general subjects are:

Special breeding for meat type; What buyers of market poultry prefer; Inheritance of egg production; Effect of heavy laying on breeding power; Qualifications of a breeder; Work of the breeder; Building a strain; Inbreeding; Linebreeding; Variation; Prepotency; Judging the shape of a bird; Body shape of good layers; How to cull the flock; Value of the plumage; Color and structure of plumage; Breeding color and markings; Double mating; Growth of plumage; Molting.

No matter what breed of chicks you raise, whether English, Mediterranean, or American, you will learn much to your advantage.

you know their breeding for several generations back, which is very important. This matter of pedigree reminds me of the old saying: "When is the proper time to begin training a child?" The answer is: "Begin with his grandparents."

Too many breeders buy exhibition males and do not know their breeding. Just so a male is a prize winner! I would not give a male room in my breeding pen if I didn't know his breeding, or if he did not breed good pullets.

We cannot make a mistake if we line breed in families. That is, if we have a hen that is an exceptionally good breeder put her in a pen with her best daughters mated properly to a good male of same line; but not too closely related, and their progeny will be more uniform.

I double mark my cockerels; that is, I toe mark them when hatched from the pen they are out of. Then when about two months old, just before they loose their penciled feathers I band those that show the best penciling, and if they develop well otherwise I select them as my breeders.

If we must go outside for new blood we get it from the female side by procuring a good hen or pullet. She is then mated to a good male of our own raising, and if the chicks are good we are safe in using the cockerels in our pens the following season and the pullets with our males. Thus we have plenty of new blood.

Now the last but not the least. Let us note type and size. No matter how good color we have or how well penciled, if we have this color on a Leghorn for size or a Langshan for type, we have no Wyandotte. If we breed carefully for type, size and color we can continue to hold our banner high as having not only a breed that is one of the most beautiful but a breed that is unexcelled for meat and eggs as well.

100,000 Leghorn Standards.

The National S. C. White Leghorn Club held its annual meeting during the Milwaukee show and authorized A. F. Rolf, secretary, to proceed at once to prepare a Standard for White Leghorns, print 100,000 of these Standards for educational purposes and distribute them among club members, chick hatcheries, county agents, agricultural colleges, and country high schools. The club has 860 members paying dues of \$2 a year. The Standard will be distributed free of charge. It will be drafted to cover present day ideal of foremost Leghorn breeders.

Leghorn breeders feel very keenly the fact that many people who take up the variety have no easy way of learning what constitutes a high-class exhibition male or female. They propose to proceed to do educational work by distributing a Standard for the variety. It is not their desire to be antagonistic to the A. P. A. Standard of Perfection. They seek to serve, not fight. They know that there is no copyright on the English language, neither is there copyright or patent on the ideals which take their form through the constructive breeding work of the leading breeders. Therefore, the club is free to put into its own words the ideals of its own breeders. There can be no question about this.

Moreover, the A. P. A. Standard can be improved upon. It allots to shape of comb, 8 points, and to wattles and earlobes, shape 4, color 6. Wattles do not need a color valuation any more than comb. Wattles should be linked with comb, for size and texture of wattles indicate size and texture of comb. Therefore, Mr. Rolf will make his club Standard read: Comb and wattles, so many points for shape and texture. Earlobes, so many points for shape, and so many for color. This is only one of his good ideas.

Hens or Pullets for Breeders?

By Plummer McCullough.

We often hear the advice, especially among farmers, to sell off the old hens every year and keep the pullets for laying. This may be good enough advice as far as the laying part goes, but when it comes to the breeding season I am sure that is often a mistake.

Last season we had a pen of Leghorns out on free range in a small colony house, and as they were kept back in a large field where there were no other poultry near, they had free range and running water and really good conditions. There were two cockerels mated to about fifteen hens and pullets. I realize that one would have been enough and no doubt better than the two, but as the birds were on free range I thought the extra cockerel was better running on range than being cooped up all season, and as the two birds were not quarrelsome I just let the two run with the flock. These Leghorns were all in perfect health and certainly did shell out the eggs, but when it came to testing, much to my surprise, their eggs were very infertile. This was something new for Leghorns, and as there were not over 25 per cent that were good strong fertile eggs, I began to study the cause a little. After looking over the birds and conditions and seeing nothing wrong I recalled that this flock contained only two hens and the rest were all late hatched pullets.

These pullets were hatched very late the summer before and they seemed grown out at the time I was doing the hatching, but the fact remained that their eggs were not coming fertile and the hens' eggs were.

I found this also true of a few matings of Rocks, only in a little less pronounced way. One mating of Rocks that contained pullets that were late hatched and perhaps not fully grown out, gave very poor fertility. Another pen of pullets, Rocks that were hatched in July gave very little better fertility than the pen of Leghorns, while a pen of old hens that were anywhere from two to four years old, and one hen in the mating was five years old, gave splendid fertility.

These old hens were mated to a good, vigorous young cockerel. The cockerel was well matured and there were eight

hens mated to him. They were out on range every other day and kept in the house every other day. Conditions for them were not exactly ideal, but they produced good, strong, fertile eggs just the same. Now, this little experience may prove very little, if anything, but it does at least point out to me more clearly, what most of us already know and that is: We cannot breed from too late hatched pullets and expect the very best results from them.

There are exceptions to this rule, of course, and there may be plenty of people, and no doubt are, who are occasionally breeding from extremely late hatched stock and still getting results. Where the stock has been unusually well grown and well matured it can be done, but it is not the safe rule to follow.

Of course, because a few pullets did not give me good results last year I am not going to condemn all pullets by any means. Pullets are all right as breeders if they are hatched fairly early and well grown, but they do want to be well grown out and matured by the time they

are used as breeders. I also think it a great mistake for breeders and writers to always be saying: "Get rid of the old hens." This advice is good as far as it applies to hens that have been poor producers, inferior in quality, and low in vitality, but the big, strong, well-matured hens that are strong and healthy should be used as breeders, and I am not yet prepared to say at just what age a hen is too old for a breeder.

U. R. Fishel used to say that a White Rock hen was valuable as long as she lived; that is, the real productive, healthy, vigorous, hen of superior quality. If I remember right D. W. Young had one mating of White Leghorns that he mated together for six or seven years. This being true it seems that hens are good breeders at least when they are three and four years old and even a little older if their quality is really superior. Of course it will not pay to keep the ordinary hens that long. We do not want to go to extremes in either direction, but think twice before you sell all the hens and keep nothing but pullets for breeders.

First prize Rose Comb Ancona Cock. Madison Square Garden, New York City. Owned by H. Cecil Sheppard, Box 441, Berea, Ohio.

WYCKOFF'S S. C. WHITE LEGHORNS

AMERICA'S BUSINESS HEN

Acknowledged everywhere as the World's Greatest Laying Strain—unequaled in standard qualities. Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most profitable strain of poultry in America today. Place your orders at headquarters and make no mistake. SPECIAL ATTENTION is directed to the fact that the WYCKOFF LEGHORNS have been, wholly or principally, the foundation of practically every successful Leghorn farm in this country for years. This is particularly true of the flocks making the most wonderful records.

HIGH QUALITY BREEDING COCKERELS

We are now offering the most exceptional lot of early hatched breeding cockerels it has ever been our good fortune to produce. These birds are all from a special selected lot of two-year-old hens of fine type, large size and wonderful layers. They are of a quality unequalled. Greatly increase the value of your present stock by purchasing some of these grand males for your next season's breeding—cockerels of this, the oldest established strain of Leghorns, and recognized by all poultry authorities as the best.

A limited number of fine selected yearling breeding hens and yearling cocks of equal grade left to spare. No more pullets of any age at any price this season.

OUR PRICES, CONSIDERING QUALITY, ARE EXCEEDINGLY LOW

Remember that we sell only QUALITY stock such as we would use for our own breeding. No second grade or bought up junk handled at any price. As we are never fully able to meet the demand, advise that you place your order early. Send for free catalog giving prices and complete description of stock, together with testimonials from satisfied customers in all sections of the country.

Roup

When I started to raise chickens I did it more for pleasure than for financial gain. However, after I had paid \$9 for my Black Minorca rooster I did not want to lose him. So when he got the roup I, thinking it was only a bad cold and being by profession a trained nurse, used somewhat the same methods I would have employed with a patient. I knew much more about taking care of people than of chickens.

Into a quart of warm water I placed two tablespoons of salt and several teaspoons of glycothymoline. Then taking the rooster I dipped his head—or rather his beak and nose—into the solution, being careful not to get any into his eyes, and so holding him that he was forced to breathe in the solution. I repeated this several times, holding his head up occasionally, so that he could get air. I then fed him bread dipped in warm milk, containing plenty of cayenne pepper. Following this I rubbed his throat well with camphorated oil.

This treatment was repeated three times a day, and shortly he became well. Several of my hens developed the disease, and I treated them successfully in the same manner.

I have raised over six hundred chickens and have never lost one from the roup.

I have also raised turkeys and ducks with wonderful success. The fact must never be lost sight of that our feathered charges need constant care, the right kind of food, plenty of fresh water, and good comfortable houses to sleep in if we are to be successful with them.

California. Evelyn M. Sellman.

Experience and Observations.

I am a young man in my early twenties, living on a farm. My ambition is to be a poultry breeder and judge. The farm poultry flock has been my special care ever since I was able to do any work at all, and it consists of a good sized flock of Barred Plymouth Rocks of an egg-laying strain.

My time being taken up by other work on the farm, I have not had a chance to do much showing or breeding work yet. The other varieties I have bred to a limited extent are Single Comb White and Buff Leghorns and Light Brahmas. I am not going to lay claims that anyone should take up a certain breed. I love all purebred fowls, and think they will do well for their owners if rightly bred and cared for, whatever the breed or variety.

The one thing you will find me doing when in the house is studying poultry literature. This literature does not consist only of books, but numerous files of poultry magazines, among which the A. P. J. is the leader, catalogs, mating lists and bulletins. My file of poultry magazines is probably the most interesting and affords the best reading. I want to impress on everybody that it is a good idea to have an open mind and read and study a great deal, and it will be a great aid to success in your work.

In hatching with incubators I find that poor hatches, everything else considered good, is the lack of moisture. In my own case I operate the machines in an unused room upstairs in the house and supply moisture unless weather should be rainy and damp. I have a hot water and a hot air machine, and while they

both hatch about the same percentages my preference is a hot air machine, as they are easier to take care of and less bother.

I have always brooded the chicks under Barred Rock hens and usually have good success that way. It is a great labor saver and eliminates worry and bother with brooder lamps, when only a moderate number are to be raised. I give a few chicks to the hens at night and by morning they will, in the majority of cases, take all I will give them. In many instances the hens have not been broody over two days.

I find oatmeal the best food to start the chicks with. Fresh, warm milk is given night and morning the first few days, and it is surprising how soon they learn to like it, and it makes them grow, too.

Be sure the chicks are put on new ground, i. e., ground on which chicks were not raised the season before. You will see a big difference in their thrift.

I think there is a good future in the poultry business for the man who will breed for both egg-laying and fancy qualities in the same fowl, and who feeds his fowls for growth and health.

It is interesting to note the advertising in farm papers and a few in the classified columns in some poultry journals. Many are paying extra money to advertise. For example: "Rose Comb White Wyandottes," or another, "Single Comb Buff Orpingtons." If farmers and breeders were more observing or better informed they would omit the Rose Comb or Single Comb in above instances, as anyone familiar with the Standard knows that all Orpingtons have single combs and Wyandottes rose combs.

The American Poultry Association should find some means whereby it would be easier to place a Standard in the hands of every purebred poultry grower. Breed clubs and associations can do much in this direction, too. The Rhode Island Red Club have such a plan under way with their Booster Fund.

The purebred poultry business is in a prosperous condition, even with the fall in prices of other products. It will be the mainstay of many to keep some poultry through the "hard times" and I am with all poultry men and fanciers back of the great poultry industry.

Minnesota. Melvin Sansness.

The Interior of My Chicken Coop.

As a great many people may be situated the same way as I was, some years ago, i. e., have a chicken coop which really was nothing more than an empty room, a few suggestions how it may be arranged so as to resemble the inside of the houses we read about in the poultry press may not come amiss.

Our chicken coop, which is 14x24 feet, by 6 feet high, was designed to give shelter to both chickens and pigs. But later on, as my flock increased and I learned better to understand the need of poultry, the hogs had to give up their quarters and move to a home of their own. The interior of the poultry house was then changed.

The coop faces the south. There were originally three half windows, two in the south and one in the west. They were high up and threw but little light on the floor. Both of the

south windows were enlarged by adding another half window below, so that the lowest part is only 20 inches from the floor. After a while a scratching shed 16x12 was added to the south side, dropping down in front to 4 feet. There are four half windows in the south side or front of this scratching shed which are open, except on very stormy days. These windows are screened on the inside with fine mesh poultry wire, partly to keep the chickens inside, partly to keep them from breaking the glass in case they become frightened.

This scratching shed is a veritable paradise to the hens, especially on bright, sunny days.

The partition which separated the chickens from the hogs has been retained, so that I have two pens, which I can connect or separate at will by an opening which has been cut into the partition.

In each pen beneath the south window is placed a dust box, each a yard square and ten inches deep. They have no bottom. This is a great advantage, as they are more quickly cleaned than those containing them. All you have to do is to lift up the frame, scoop up the dirt, replace it and fill with fresh material.

The one thing I like best, however, is the dropping boards. When I first read about them I requested my husband to furnish our coop with some, made according to a description given in the Journal. He refused on the ground that it would take too much time to make them and that they would be too cumbersome to lower and lift back in place again. He finally promised to make them in the way he thought would serve as well and be more quickly done.

He accordingly nailed a 2x4 tight against the back wall, another 4 feet 10 inches in front of this and about 8 inches lower than the one in back. On these were placed separate boards 5 feet long and from 6 to 8 inches wide. The roosts—2x4's—are about 18 inches above this, laid on supports which are fastened against the walls. Should also state that the droppings boards are exactly midway between floor and ceiling or 3 feet from floor. This allows the sun to flood the whole floor.

Everything seemed well until, when scraping off the droppings for the first time, the boards came along with it. As this was very undesirable, I nailed cleats to the under side of the boards so that they fitted tightly against the inner side of the front 2x4. This, of course, kept them in place perfectly.

When nailing on these cleats, which, by the way, should be about two inches shorter than the width of the board, be careful to drive your nails from the top—that is, first through the board and then through the cleat, for if you drive from the bottom up they have to be clinched on top of board and when scraping the droppings your temper is not improved by the hoe being constantly arrested by the obstructions these nails form.

The advantages these droppings boards have over those forming a solid floor are obvious. In summer, when mites need looking after, all you have to do is to remove a few boards at each end, lift down the roosts and treat them to kerosene or any other insecticide you may wish to use.

Furthermore, some time during the summer the boards may be taken outside and given a good scrubbing. Last summer I simply leaned them against the north side of the coop and let the rain clean them. After a time the ends leaning against the wall and thus escaping the rain were put down towards the ground. After one or two heavy showers they were thoroughly clean.

The nests are not exactly modern, but they answer the purpose. I have two rows of them, each containing six nests, besides some boxes fastened against the partition, and a barrel. The floor of the nests was originally

nailed tight. As it was a tedious piece of work to clean them, I had the boards forming the floor of the nest taken off and fastened to the back by means of hinges. In the front it is held up by two strong wires which fasten to nails. And so now, when cleaning the nests, all I have to do is to release the wire and the board will fall back against the wall.

I have, of course, shell and grit boxes hanging on the wall. Have nails driven in at several places to hold the mangles. Cabbages, provided there are any, hang on strings from the ceiling.

The water stands on the table (one

DR. HESS POULTRY PAN-A-CE-A

Universally endorsed—Universally used:—by the big 10,000 hen plants—by the average farmer with his 200 hens—by the back-yarder with only a dozen hens to consume the table scraps. Pan-a-ce-a tones up the dormant egg organs, so that the proper amount of a hen's food goes to egg-making—and not all to fat, flesh and laziness. A Pan-a-ce-a hen is always a hungry hen, an industrious hen. You can depend upon it, the healthy, hungry, scratching, singing hen is the laying hen, the paying hen.

Always buy Pan-a-ce-a according to the size of your flock. Your dealer has a package to suit. Good results guaranteed.

Packages from 25c to the 100 lb. drum, \$10.00. Except in the far West and Canada.

marking fowls. **Management:** Advertising, selling methods, marketing, caponizing, by-products of the poultry flock, including the preservation and uses of manure, feathers, and so on; shipping instructions, preparing birds for exhibitions, preserving eggs, killing and dressing poultry, practical study of the formation of eggs, embryology, measures that prevent mortality among chicks, broiler raising, importance of good business methods. **Equipment:** Working plans and instructions on how to make all kinds of poultry appliances, self-rising doors, ventilators, catching coops, broody hen boxes, trapnests, fattening pens, egg candlers, feed hoppers, erecting poultry netting, racks for sprouting oats, hatching egg cabinets, electric egg tester, outdoor incubator, colony brooders, feeding frames, etc. **Commercial Poultry Raising**, in fact, is an encyclopedia brought right down to date. A copy should be in the hands of everyone who wants to make a profit from hens.

AMERICAN POULTRY JOURNAL

523 Plymouth Court, Chicago, Illinois

in each pen) made of a board 2 feet long by 1 foot wide, one side of which is nailed tightly against the wall, the other supported by two legs. It is 2 feet from the floor. My dry mash containers are not yet what they should be. I have thus far nothing but pans, which, in order to keep the litter out, are placed on boxes. In each of the pans is placed a brick to prevent them from being overthrown.

This completes the list, except artificial heat. I have it, but whether to recommend it or not, I do not know. One thing is certain, I like it. At first our coop, which is built on low ground, was very moist, nay, even wet inside, whilst now it is perfectly dry. I now know I might have corrected that by keeping cloth tacked over an open window, but I did not then.

At first I had quite a lot of trouble in keeping the house from overheating, and I know that I did the hens more harm than good at times. Now this does not happen any more. I keep the temperature between 40 and 50 degrees with the thermometer hung $4\frac{1}{2}$ feet from the floor. The door leading to the scratching shed is kept open all day. The stove is placed a foot and a half from the south wall in the larger pen. It is enclosed with poultry wire, which enclosure can be entered from the smaller pen by means of a screen door. In this way the fresh air enters both pens. At night the scratching shed door is closed and the fire allowed to die down.

Now, there are two or three neighbors whose hens do fully as well as mine, and sometimes better, who have no artificial heat, so it is not the heat that does it, and one of these winters I may do without it, provided that some of those terrible cold days we have to contend with up here does not change my mind.

Wis.

Mrs. George Egle.

Markets and Products.

When choosing a location for a poultry farm it would be best to consider carefully the two markets with which the poultry producer is chiefly concerned. One of these, the market where he buys his feeds, and the other market where he sells his products. While it is naturally difficult, if not impossible, to find a location which combines a low feed market with a high priced market for the products, it is really essential to have one of the favorable conditions. Zero in locations would be a region where not enough grain is produced for home use, resulting in high feed prices, and where the market for poultry products is far distant; and the beginner should take extreme care to avoid such a location although he would probably be attracted there by the low price of the land. A breeder of high class purebred poultry, which is sold all over the country, could probably do fairly well there but even he would be under a serious handicap in many ways in such a cheap-land location.

The thing of second importance is to arrange to have something to sell at all seasons. Market eggs rank high here, and the endeavor should be to produce them for the high priced trade. The season for them lasts the whole year, subject to seasonal fluctuations in price and quantity. Correlated is the production of market poultry, the season for which may be long drawn out, and good prices may be obtained for the higher qualities of broilers, milk fed roasters, capons, etc. While many devote themselves to the above branches exclusively, and others to the production of high-class pure bred stock, it would be best in many cases to combine the two, at least to a certain extent.

The seasons for the sale of purebred poultry for breeding and exhibition, of course, differ from the market end. The hatching egg season begins about February and continues to May, and laps over

the baby chick season, which begins with the milder weather and generally lasts until June, or even later with a few orders from customers in situations especially favored by the climate. After this comes the buying season for well started pullets, then laying pullets, which in turn laps with the season when people begin to buy high-class birds for fairs and shows, and for use in the breeding pens. The buying of high grade stock generally runs from late August to April 1, being strongest in the months from October to February. This rounds the year, and with a little management a steady stream of products can be shipped from the little farm which would sum up a surprising total.

The beginner should get as high quality stock as he can manage, even stinting in other particulars to secure such foundations stock, for truly the chickens are the main thing on a poultry farm, and the classy beauties of his choice will always inspire him so that he will work to better his flock. Inspiration would be much handicapped by a flock of mongrels or scrubs. The high priced ones can produce many times their number in a year just as cheaply as scrubs, giving many chances to sell at nice profits which would be entirely lacking with the common kind.

It is advisable to know something of the ancestry of the birds one is to use in his breeding yards, as the ancestry has much to do with the offspring. Some scientist has said that the offspring inherit half their traits from the parents, one fourth from the grandparents, one-eighth from the great grandparents and so on. Also the continuous elimination of undesirable birds results in the production of a strain of increasing purity of type, the progeny of which is always a step nearer the ideal. The beginner may get the benefit of this by purchasing birds of some well established strain, and then taking care not to make any radical outcrosses.

Paul Schultetus.

Illinois.

CLASSIFIED ADVERTISEMENTS

UNDER this heading ads will be inserted for fifteen cents per word each month for less than three months, or *thirty-six cents per word for three months*. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under *classified headings*. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from AMERICAN POULTRY JOURNAL than from any other poultry journal—none excepted. On writing any of these advertisers, mention AMERICAN POULTRY JOURNAL. *All copy for Classified Ads must reach us by the 17th of month preceding the date of issue. These Rates Void After May 20th, 1922.*

Show Birds That Win

To win at your particular show, Mr. Exhibitor, you must have some assurance that you purchase birds that will do this for you. Read about our wonderful record and the reason why we have been enabled to win year after year.

Every one of our show birds bears a remarkable likeness to its parent stock, because for the past twenty years the birds of this wonderful strain have been so mated that it is only natural to expect them to carry away the most coveted prizes. For more than 20 years Oak Dale Leghorns have carried away the highest honors at Madison Square Garden and Boston.

1921 MATING LIST FREE: Send today for this booklet and therein you will find listed the most marvelous Single Comb White Leghorn Winners of the past twenty years. And whose progeny we are offering to you at prices within the reach of all. *We can also furnish you with Pens, Trios, Pairs and Single Birds.*

30 Prizes Out of 30 Offered

Sweepstakes Championship Male and Female and Every Special Prize—every bird bred on my farm.

This amazing record is an exact duplicate of the Imperial "Ringlet" record of 1920 at Madison Square Garden.

These 100% Perfect Records are the crowning achievement of the unexampled "Ringlet" Records at New York for more than 30 victorious years.

The competition at this show was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

First Prize Sweepstakes Champion Cockerel
at Madison Square Garden, New York

Supreme at Madison Square Garden Is Supreme Everywhere

GRAND WINNING SHOW BIRDS

The finest that all America has ever produced are now on my farm ready to win Blue Ribbons and Silver Cups for you in any competition in the world, in Cocks, Cockerels, Hens, Pullets and Pens. Their matchless "Ringlet" barring wins under all judges. As layers they stand pre-eminent.

I SHIP BIRDS AND EGGS

from the best on my farm. I believe the most prominent breeders everywhere are using Imperial "Ringlets" to improve their stock and that there is not a fine Barred Rock—either male or female—in all America today that does not contain "Ringlet" blood.

During the past ten years the matings on my farm have done more to improve the Barred Rocks of America than all the matings of the whole country combined.

I have shipped thousands of sons and daughters of my Madison Square Garden winners—the finest birds that ever lived—and eggs from these prize winners.

Imperial "Ringlets" are the standard for all the Barred Rocks in America.

Elegant catalog mailed upon request

EGGS

From the finest exhibition matings in the world. One setting \$20, two settings \$35, four settings \$60, 100 eggs \$90
